POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

(98-33)

HEARINGS

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES

OF THE

COMMITTEE ON
PUBLIC WORKS AND TRANSPORTATION
HOUSE OF REPRESENTATIVES

NINETY-EIGHTH CONGRESS

FIRST SESSION

FEBRUARY 23; AUGUST 2; SEPTEMBER 20, 22; OCTOBER 18, 19, 20; NOVEMBER 1, 2, 3, 9, 10, 15, 16, 17, 1983

Printed for the use of the
Committee on Public Works and Transportation

U.S. GOVERNMENT PRINTING OFFICE

20-955 O WASHINGTON : 1984

TESTIMONY

Agnew, Marian K., president, the Center for Environmental Strategy 2363
Allegretti, Thomas, American Demineralizer Co 2013
Asadoorian, Leon, president, Methuen Construction Co., Methuen, Mass.; and Robert Briant, executive director, Utility Contractors Association of New Jersey, Edison, N.J 1492
Austermann, Richard O., Esq., Amax Inc., Denver, Colo 1293
Babcock, Hope M., deputy counsel, National Audubon Society 3007
Banks, James Taylor, senior attorney, and Frances Dubrowski, senior attorney, Natural Resources Defense Council 2197
Barnard, William D., Project Director of the Office of Technology Assessments' Study of Approaches to Wetlands Use 1789
Beach, Buddy, vice president, Environmental Affairs, Consolidated Coal Co., Pittsburgh, Pa., and chairman, AMC's Water Quality Subcommittee 1165
Bloch, Ethyle, president, Indiana Division, Izaak Walton League; and Daniel Weiss, Conservation Associate 2210
Blower, Kenneth E., manager of environmental affairs, Standard Oil of Ohio .. 2513
Bochert, Linda, executive assistant, Wisconsin Department of Natural Resources, accompanied by John Konrad, chief, Nonpoint Source Section, Bureau of Water Resources Management 2948
Bogan, Raymond D., United Boatmen of New Jersey 1100
Bond, Dr. Bill J., manager, Office of Natural Resources and Economic Development, Tennessee Valley Authority, accompanied by Dr. Alfred Duda, member of TVA's Environment Quality Staff 2835
Brooks, Norman H., engineering consultant, city and county of San Francisco, accompanied by Jan Berry, assistant executive director, San Francisco clean water program, Department of Public Works, city and county of San Francisco; Steven S. Rosenthal, legal counsel, city and county of San Francisco; and Sharon Edwards, Washington representative and legislative counsel, city and county of San Francisco 2385
Brown, Dr. William Y., senior scientist and attorney, Environmental Defense Fund, and National Audubon Society 2108
Browne, Frank, Ph. D., P.E., chairman, Professional Coordination Committee, American Society of Civil Engineers, accompanied by Clyde Wilber, member, professional coordination committee 1842
Bryant, Hon. Wayne, New Jersey assemblyman 495
Button, Charles, chief engineer, Boston Water and Sewer Commission 895

Page

Campbell, Stephen, president and chief executive officer, Bio Gro Systems, Inc., Annapolis, Md 1866
Carr, Carolyn Ann, chairman, Sierra Club Clean Water/Toxics Campaign 2440
Chapman, Priscilla A., executive director, New England Chapter, Sierra Club . 2363
Chesebrough, Eben, president, North American Lake Management Society 3095
Clark, Dr. Edwin H., II, senior associate, the Conservation Foundation 3007
Cohen, Philip, chief hydrologist, U.S. Geological Survey, Department of the Interior 3246
Coward, Charles W., vice president, Eagle Dyeing and Finishing Co., Mount Holly, N.J 1378
Coy, Les, chairman, 208 Water Quality Subcommittee of the Environment Management Committee. National Cattlemen's Association 3165
Coyne, Hon. William J., a Representative in Congress from the State of Pennsylvania 2786
Davison, Robert P., Ph. D., Fisheries and Wildlife Division, National Wildlife Federation 2108
Delcour, David, chairman, Clean Water Ad Hoc Committee, Western Regional Council 440
Dimino, Michael A., president, Authorities Association of New Jersey 1007
Dysart, Dr. Benjamin C., III, president and chairman of the board, National Wildlife Federation, accompanied by Sharon Newsome, legislative representative; Dr. Paul Ringold, director, ocean discharge project; Dr. Allen Wentz, director, fish and wildlife project 297
Dyson, Hon. Roy, a Representative in Congress from the State of Maryland 205, 1013, 3194
Eidsness, Frederic A., Jr., Assistant Administrator for Water, U.S. Environmental Protection Agency, accompanied by Steven Schatzow, Director, Office of Water Regulation and Standards; Al Rubin, Chief, Water Quality Criteria Section, Criteria Branch; David Sabock, Chief, Criteria Branch, Office of Water Regulations and Standards; Ephraim King, attorney adviser, Office of Legislation; and Tudor Davies, Director of Policy, Office of Water 113
Feighan, Hon. Edward F., a Representative in Congress from the State of Ohio 501
Filippone, Ella F., Ph. D., executive administrator, Passaic River Coalition 1100
Fish, Hon. Hamilton, Jr., a Representative in Congress from the State of New York 486
Fisher, Wilson, president, Hess and Fisher Engineers, Inc., Clearfield, Pa., and chairman, Water Quality Subcommittee, Mining and Reclamation Council, accompanied by Alfred E. Whitehouse, environment-engineer, Buffalo Coal Co., Bayard, W. Va., on behalf of the Mining and Reclamation Council and the Pennsylvania Coal Mining Association 1262
Freese, Paul V., chairman, Government Affairs Committee, Water Pollution Control Federation, accompanied by Robert A. Canham, executive director; Andrew Stevenson, public affairs manager 327
Garabedian, Michael, Northeast Regional Office, Sierra Club 2214
Gartlan, Hon. Joe, a State senator, State of Virginia 3194
Gianelli, Hon. William R., Assistant Secretary of the Army (Civil Works), accompanied by Maj. Gen. John F. Wall, Director of Civil Works, U.S. Army Corps of Engineers; and Morgan Rees 2596
Gibson, John, attorney, Pacific Gas and Electric, on behalf of the Edison Electric Institute 1759
Glover, Rodney C., manager, environmental technology and regulatory affairs, Procter and Gamble Co., on behalf of the American Paper Institute and the National Forest Products Association 1746
Goldman, Harvey, partner, Arthur Young & Co 1775
Goulding, Randolph, executive vice president, Jordan, Jones and Goulding, Atlanta, Ga., and chairman, Environmental Committee, American Consulting Engineers Council, accompanied by Laurence D. Bory, director, governmental affairs, ACEC 1318
Hammon, Alfred, chairman, Harbors and Navigation Committee, American Association of Port Authorities, and supervisor, harbor planning, Port Authority of New York and New Jersey, accompanied by Peter Gatti, counsel for government relations 1823
Hanmer, Rebecca, Deputy Assistant Administrator, Office of Water, U.S. Environmental Protection Agency, accompanied by Thomas Eichler, Regional Administrator, EPA's Region III, Philadelphia, Pa.; Dr. Tudor Davies; and Greene Jones, Water Division Director, Philadelphia, EPA 3217

Page

Hart, John R., member, West Virginia Utility Contractors Association and West Virginia Society of Professional Engineers, accompanied by Nick Ciccarello, Jr., executive director, West Virginia Utility Contractors Association 1272
Haun, J. William, chairman, NEDA clean water project and vice president, engineering policy, General Mills Inc., accompanied by C. Jeffrey Zimmerman, chairman, NEDA/Water's Technical Committee and manager, external affairs, health and environment, Occidental Petroleum Corp 2560
Hawley, Bruce, assistant director, Washington Office, American Farm Bureau 3165
Hayden, Wes, legislative counsel, International Association of Fish and Wildlife Agencies 2108
Hoge, Carson H., P. E. general manager, Brazos River Authority, Waco, Tex.... 1800
Holt, Donald A., Jr., joint chairman, board of directors, Orange County Sanitation Districts, accompanied by Wayne Sylvester, assistant general manager; Douglas Segar, scientist; and Lee C. White, Washington counsel 765
Holtan, Andrew A., chairman, Governmental Affairs Committee, National Environmental Training Association 1115, 3395
Hughes, Hon. Harry, Governor, State of Maryland 3194
Humphrey, James R., vice president, Humphrey Chemical Co., North Haven, Conn., on behalf of Synthetic Organic Chemical Manufacturers Association, accompanied by Thomas Goldberg, manager of environmental affairs, SOCMA; and Douglas Kliever, counsel, SOCMA 3265
Hunter, Hon. Duncan, a Representative in Congress from the State of California, accompanied by Richard King, director, San Diego Water Utilities Department; and William Harrington, Washington representative, San Diego 460
Hyner, Mark S., on behalf of the Connecticut Association of Metal Finishers ... 1042
Hysell, Don, BASF Wyandotte Corp., Huntington, W. Va., on behalf of the West Virginia Chamber of Commerce 2424
Jensen, Harold, director, energy conservation and environmental control, Warner-Lambert Co., Morris Plains, N.J., and chairman of the water task force, representing the National Association of Manufacturers 345
Jensen, Harold, director, energy conservation and environmental control, Warner-Lambert Co., Morris Plains, N.J., and chairman of the water task force, National Association of Manufacturers, accompanied by Louis Gilde, director of environmental programs, Campbell Soup Co., Camden, N.J.; and Daniel W. Cannon, director of environmental affairs, National Association of Manufacturers 1135, 3180
Johnson, A. Reid, clean water chairman, National Affairs and Legislation Committee, Garden Club of America 1039
Kaiser, Charles B., Jr., assistant executive director and general counsel, Metropolitan St. Louis Sewer District and chairman, AMSA Legislative Committee, on behalf of the Association of Metropolitan Sewerage Agencies, accompanied by Lee C., White, counsel to AMSA; and Ken Kirk, assistant executive director, AMSA 2888
Kanerva, Roger A., manager, environmental programs, Illinois Department of Environmental Protection 995
Kazen, Hon. Abraham, Jr., a Representative in Congress from the State of Texas 364
Keeton, Ruth, chair, Howard County Council, Maryland, National Association of Regional Councils, and member, regional planning council, Baltimore, Md; accompanied by John J. Bosley, counsel 356
King, John, director of regulatory affairs, Tricil Environment Services, Dayton, Ohio, accompanied by Arleen Shulman, federal affairs manager, National Solid Wastes Management Association, Washington, D.C 1285
Kiolbassa, Frank R., director, Department of Public Works, city of San Antonio, accompanied by Robert Weaver, consulting counsel 2776
Krueger, Larry, chief executive officer, Pelton Casteel Corp 2428
Lawler, Hon. Brian J., mayor, city of New Bedford, Mass 408
Ledbetter, J. Leonard, director, environmental protection division, Georgia Department of Natural Resources, on behalf of the Association of State and Interstate Water Pollution Control Administrators, accompanied by Linda Eichmiller, deputy director, Association of State and Interstate Water Pollution Control Administrators; Steve Rieck; and Candy Penn, Office of the Governor of Georgia 2634
Li, Vivien, chair, New Jersey Chapter of the Sierra Club 1100
Mace, Garroll, executive director, Clearfield Pennsylvania Chamber of Commerce 2379

Page

Malloch, Charles D., director, regulatory management, Monsanto Chemical Co 1983
Manning, William, safety and environmental affairs manager, Lousiana Land and Exploration Co., on behalf of the American Petroleum Institute, Western Oil & Gas Association, Alaska Oil & Gas Association, Mid-Continent Oil & Gas Association and Wetlands Energy Production Association 2513
Marsh, Langdon, executive deputy commissioner, New York State Department of Environmental Conservation 370
Martin, Hon. Earl, mayor of Rocky River, Ohio 501
Matthews, Robert A., Union Carbide Corp., on behalf of the Chemical Manufacturers Association 1950
McComb, John, director, Washington Office, Sierra Club 297
McGreer, Dale, forest hydrologist, Potlatch Corp., on behalf of the American Paper Institute and the National Forest Products Association 3007
Mikulski, Hon. Barbara, a Representative in Congress from the State of Maryland 3194
Mrazek, Hon. Robert J., a Representative in Congress from the State of New York 2590
Myers, Alvin, manager, governmental relations division, Pennsylvania Farmers Association, accompanied by Paul Swartz, executive secretary, Pennsylvania Soil Conservation Commission 3256
Mytelka, Alan I., Ph. D., director and chief engineer, Interstate Sanitation Commission, accompanied by Mitchell Wendell, general counsel 1155
National Society of Professional Engineers Panel: Kermit L. Prime, P. E., chairman, Legislative and Government Affairs Committee; Louis L. Guy, chairman, legislative education fund; Robert J. Haefeli, past president, New Jersey Society of Professional Engineers and Land Surveyors, Inc.; David McDowell, Buchart-Horn, Inc., Lewisburg, Pa.; and Bill Fogarty, staff, Legislative and Government Affairs Department 3383
Nogaki, Jane, corresponding secretary, Coalition Against Toxics 1100
Oberstar, Hon. James L., a Representative in Congress from the State of Minnesota 2821
O'Neal, John A., vice president, Ad+Soil Services, Inc 1866
Ottinger, Hon. Richard L., a Representative in Congress from the State of New York 486
Perry, Robert R., assistant executive director, Water Pollution Control Federation; accompanied by Andrew Stevenson, manager, public affairs 1618
Potter, Hon. Neal, council member, Montgomery County, Md., on behalf of the National Association of Counties 2973
Prime, Kermit L., P. E., chairman, Legislative and Government Affairs Committee, National Society of Professional Engineers, accompanied by Bill Fogarty, assistant director, legislative staff 1055, 3383
Ranno, Philip S., Ranno Electro Plating Corp., Saddle Brook, N.J., National Association of Metal Finishers 2457
Reeves, Merilyn B., natural resources coordinator and second vice president, League of Women Voters of the United States 3095
Rice, Dr. I. M., executive vice president, Trinity Improvement Association, Irving, Texas 1800
Robb, Hon. Charles, Governor, Commonwealth of Virginia 3194
Rockenstein, Hon. Walter, city council member, Minneapolis, Minn., on behalf of the National League of Cities 2973
Ruckelshaus, Hon. William D., Administrator, U.S. Environmental Protection Agency, accompanied by Jack Ravan, Assistant Administrator for water; and Rebecca Hammer, Deputy Assistant Administrator for water 2719
Rutland, Frank, vice president, for manufacturing, Armira Corp. and member, Tanners' Council of America Technical Committee, accompanied by Dr. Robert M. Lollar, technical director, Tanners' Council Research Laboratory, University of Cincinnati; and Richard Schwartz, counsel, Tanners' Council, on behalf of the Tanners' Council of America 2472
Salomone, Lawrence, Poolesville Area Citizens, Poolesville, Md.; accompanied by Bob Watson 1585
Sampson, Neil, executive vice president, National Association of Conservation Districts 2973
Saxton, John, member, Interstate Conference on Water Problems, and Director, Arkansas Soil and Water Conservation Commission 2214
Schlossel, Dr. Richard, senior consultant, Chemical Engineering Department, Princeton University 2457

Page

Siegel, Richard D., Deputy Assistant Secretary for Natural Resources and the Environment, U.S. Department of Agriculture, accompanied by Warren Harper, Hydrologist, Forest Service; and Peter Myers, Chief, Soil Conservation Service 2794
Siegmund, John W., member, Environmental Affairs Committee, American Society of Mechanical Engineers 1052
Silverman, Larry, executive director, American Clean Water Association 1866
Smith, Jerrel D., manager, Environmental Services Department, Union Electric Co., St. Louis, Mo., on behalf of the Edison Electric Institute 1759
Solomon, Hon. Gerald B., a Representative in Congress from the State of New York 486
Spear, Kenneth, Infilco Degrement, Richmond, Va., on behalf of Water and Wastewater Equipment Manufacturers Association, Inc 1829
Stein, Jack, manager, environmental engineering planning, Anheuser-Busch, Inc., on behalf of the St. Louis Regional Commerce and Growth Association. 1001
Stengel, Geoffrey, Jr., president, Envirite Corp., accompanied by Larry S. Snowhite, Esq., Mintz, Levin, Cohn, Ferris, Glovsky, and Popeo, P.C., Washington, D.C 1643
Stiles, Maynard C., director of public works for the city of Memphis, Tenn 1850
Swimmer, Ross, principal chief, Cherokee Nation, on behalf of Wilfred Scott, vice chairman, Nez Perce Tribe, representing Council of Energy Resource Tribes 1023
Teates, Grove, N. Grove Teates and Associations, Inc 1866
Tumolillo, Allan M., assistant commissioner of ports and terminals, city of New York, accompanied by Joseph T. McGough Jr., commissioner, Department of Environmental Protection, city of New York 394
Weiss, Daniel, Conservation Associate, Izaak Walton League 297
West, William L., director of environmental control, Republic Steel Corp., and chairman, AISI Committee on Environment, on behalf of the American Iron and Steel Institute 349
West, William L., director of environmental control, Republic Steel Corp., and chairman of the AISI Committee on Environment on behalf of the American Iron and Steel Institute, accompanied by Bruce Steiner, manager of environmental engineering, Armco, Inc 2530
Wilson, Hon. Pete, Senator, State of California 460

SUBMISSIONS FOR THE RECORD

Agnew, Marian K., president, the Center for Environmental Strategy, statement with attachments 2322
Allegretti, Thomas, American Demineralizer Co., statement with attachments 1992
Asadoorian, Leon, president, Methuen Construction Co., Methuen, Mass., and Robert Briant, executive director, Utility Contractors Association of New Jersey, Edison, N.J., joint statement on behalf of National Utility Contractors Association (NUCA) 1464
Austermann, Richard O., Amax Inc., statement 1288
Babcock, Hope M., deputy counsel, National Audubon Society:
  Statement 2998
  Article entitled "The Chesapeake Bay—A Resource in the Balance" (from the Journal Water Pollution Control Federation, Oct. 21, 1983) 3039
  Article entitled "The Edge Gets Thinner" (from the Audubon magazine) ... 3010
Banks, James Taylor, senior attorney, Natural Resources Defense Council, statement with attachments 2129
Barnard, William D., Project Director of the Office of Technology Assessment's study of Approaches to Wetland Use:
  Statement 1787
  Responses to supplemental questions posed by Representative Stangeland 1794
Beach, Buddy, chairman, American Mining Congress Water Quality Subcommittee, responses to supplemental questions posed by Representative Stangeland 1169
Berry, Jan, assistant executive director, and Norman H. Brooks, engineering consultant, San Francisco clean water program, on behalf of the city and county of San Francisco, statement 2383
Bloch, Ethyle, president, Indiana Division, Izaak Walton League, statement 2293
Blower, Kenneth E., manager of environmental affairs, the Standard Oil Co. of Ohio, on behalf of the American Petroleum Institute:
  Statement 2482

Page

Bochert, Linda, executive assistant, Wisconsin Department of Natural Resources, statement 2941
Bogan, Raymond D., United Boatmen of New Jersey, statement 1090
Bond, Dr. Billy J., Manager, Office of Natural Resources and Economic Development, Tennessee Valley Authority:
  Statement 2824
  Proposal for a National Demonstration of Methods to Improve the Quality of Reservoir Releases 2828
  Responses to supplemental questions posed by Representative Stangeland 2843
Brooks, Norman H., engineering consultant on marine disposal for the city and county of San Francisco:
  Draft, "Water Quality Control Plan for Ocean Waters of California" 2391
  Responses to supplemental questions posed by Representative Stangeland 2415
Brown, William Y., Environmental Defense Fund and National Audubon Society:
  Statement 2091
  Letter supplementing testimony 2126
Browne, Frank, Ph. D., P. E., chairman, Professional Coordination Committee, American Society of Civil Engineers, statement 1837
Button, Charles, chief engineer, Boston Water and Sewer Commission, statement 894
Campbell, Stephen, president and chief executive officer, Bio Gro Systems:
  Statement 1856
  "Sludge Utilization" Bio Gro Systems brochure 1859
Carr, Carolyn Ann, chairman, Sierra Club Clean Water/Toxics Campaign, statement 2434
Chapman, Priscilla A., executive director, New England Chapter, Sierra Club, statement 2318
Chesebrough, Eben, president, North American Lake Management Society, statement 3063
Clark, Edwin H., II, senior associate, the Conservation Foundation, statement. 3003
Cohen, Philip, chief hydrologist, U.S. Geological Survey, Department of the Interior, statement 3223
Coward, Charles W., vice president, Eagle Dyeing and Finishing Co., Mount Holly, N.J., letter re Mount Holly Sewerage Authority 1382
Coy, Les, chairman, 208 Water Quality Subcommittee of the Environmental Management Committee, National Cattlemen's Association:
  Statement 3105
  A Cattlemen's Guide to Water Pollution Control and 208 Water Quality Planning 3110
Coyne, Hon. William J., a Representative in Congress from the State of Pennsylvania, statement 2785
Davison, Robert P., Ph. D., Fisheries and Wildlife Division, National Wildlife Federation, statement 2018
Delcour, David, chairman, Clean Water Ad hoc Committee, Western Regional Council:
  Statement 414
  Responses to supplemental questions 445
Donnelly, Hon. Brian J., a Representative in Congress from the State of Massachusetts, statement 361
Dubrowski, Frances, senior attorney, Natural Resources Defense Council, Inc., statement 2169
Dysart, Dr. Benjamin C. III, president and chairman of the board, National Wildlife Federation, statement 215
Dyson, Hon. Roy, a Representative in Congress from the State of Maryland:
  Statements 197, 1011
  H.R. 2817: To amend the Federal Water Pollution Control Act to provide for the enhanced water quality of the Chesapeake and Narragansett Bays, and for other purposes 200
  Additional information on the construction grants program for the Chesapeake Bay 1016
Eidsness, Frederic A., Jr., Assistant Administrator for Water, U.S. Environmental Protection Agency:
  Statement 3
  Responses to supplemental questions posed by Representative Stangeland 160

Page

Feighan, Hon. Edward, a Representative in Congress from the State of Ohio:
H.R. 3956 503
EPA letter of January 25, 1971 506
Rocky River Wastewater Treatment Plant Chronology (November 8, 1967 to October 18, 1982) 511
Report to the Board of Cuyahoga County Commissioners Cleveland, Ohio, on the Evaluation of Existing Wastewater Treatment Facilities, August 1977 631
Filippone, Ella F., Ph. D., executive administrator, Passaic River Coalition, statement 1091
Fish, Hon. Hamilton, Jr., a Representative in Congress from the State of New York, statement 484
Fisher, Wilson, president, Hess & Fisher Engineers, Clearfield, Pa., and Alfred E. Whitehouse, environmental engineer, Buffalo Coal Co., Bayard, W. Va., on behalf of the Mining and Reclamation Council, and the Pennsylvania Coal Mining Association, statement 1259
Frank, Susan, commissioner, New York City Department of Ports and Terminals, statement 389
Freese, Paul, chairman, WPCF Government Affairs Committee, Water Pollution Control Federation:
Statement with attachment 320
Water Pollution Control Federation Journal, "Industrial pretreatment needs to be evaluated at the national level", October 1981 333
Responses to supplemental questions posed by Representative Stangeland 329
Letter supplementing testimony to Hon. Geraldine Ferraro 341
Garabedian, Michael, Sierra Club Northeast Regional Office, statement 2206
Gianelli, Hon. William R., Assistant Secretary of the Army (Civil Works):
Statement 2595
Responses to supplemental questions posed by Representative Stangeland 2622
Glover, Rodney C., manager, Environmental Technology and Regulatory Affairs, Procter and Gamble Co., on behalf of the American Paper Institute and the National Forest Products Association:
Statement 1651
Pretreatment proposal 1751
Goldman, Harvey, partner, Arthur Young & Co., statement 1772
Goulding, Randolph, executive vice president, Jordan, Jones & Goulding, Atlanta, Ga., and chairman, ACEC Environmental Committee, American Consulting Engineers Council:
Statement 1307
Responses to supplemental questions posed by Representative Smith 1322
Hammon, Alfred, chairman, Harbors and Navigation Committee, The American Association of Port Authorities, and supervisor, harbor planning, Port Authority of New York and New Jersey, statement 1807
Hanmer, Rebecca, Deputy Assistant Administrator, Office of Water, U.S. Environmental Protection Agency, statement 3215
Haun, J. William, vice president, General Mills, on behalf of the clean water project of the National Environmental Development Association:
Statement 2534
NEDA/clean water project report, October 1982 2552
Letter and report regarding "integrated facilities" 2565
Hawley, Bruce, assistant director, Washington Office, American Farm Bureau Federation:
Statement 3164
Responses to supplemental questions posed by Representative Daub 3171
Hayden, Wes, legislative counsel, International Association of Fish and Wildlife Agencies:
Statement 2105
"Resolution #3 adopted by International Association of Fish and Wildlife Agencies, Hilton Head Island, South Carolina, Sept. 21, 1982, 'Threat to Wetlands Preservation' " 2116
Hernandez, Dr. John, Deputy Administrator, U.S. Environmental Protection Agency, statement 114
Hoge, Carson H., general manager, Brazos River Authority of Texas, statement 1797

Page

Holt, Donald A., Jr., joint chairman, board of directors, Orange County Sanitation District:
Statement 758
Deep ocean disposal of sewage sludge off Orange County, Calif., a research plan by Environmental Quality Laboratory, California Institute of Technology (EQL report No. 21, November 1982) 771
Holtan, Andrew A, chairman, governmental affairs committee, National Environmental Training Association, statement 1111, 3393
Hughes, Hon. Harry, Governor, State of Maryland, statement 3202
Humphrey, James R., vice president, Humphrey Chemical Co., North Haven, Conn., on behalf of Synthetic Organic Chemical Manufacturers Association:
Statement 3261
Supplemental statement 3270, 3273
Hunter, Hon. Duncan, a Representative in Congress from the State of California, statement 459
Hysell, Don, employee of B.A.S.F. Wyandotte Corp., Huntington, W. Va., on behalf of the West Virginia Chamber of Commerce, response to supplemental question posed by Representative Rahall 2427
Interstate Conference on Water Problems, Joan M. Kovalic, executive director and general counsel:
Comments on EPA's proposed water quality standards regulations 2224
Survey of the States on programs relating to section 404, Public Law 92-500, and section 10, Rivers and Harbors Act of 1899 (March 1979) 2241
Jensen, Harold, director, energy conservation and environmental control, Warner-Lambert Co., on behalf of National Association of Manufacturers:
Statements 344, 1122, 3176
"Expensive Discharges from Cannery Row", by Jerry L. Jones, Water/Engineering and Management, November 1983 3184
Johnson, Mrs. A. Reid, clean water chairman for the national affairs and legislative committee, the Garden Club of America, statement 1037
Kaiser, Charles B., Jr., assistant executive director and general counsel, Metropolitan St. Louis Sewer District, and chairman, AMSA Legislative Committee, on behalf of the Association of Metropolitan Sewerage Agencies:
Statement 2676
Responses to supplemental questions posed by Representative Stangeland 2696
Kanerva, Roger A., manager, environmental programs, Illinois Environmental Protection Agency, statement 903
Keeton, Ruth, Chair, Howard County Council, member, regional planning council, Baltimore, Md., on behalf of the National Association of Regional Councils, statement 352
Kiolbassa, Frank R., director, department of public works, city of San Antonio, statement 2773
Lawler, Hon. Brian J., mayor, city of New Bedford, Mass., letter supplementing testimony 413
Ledbetter, J. Leonard, director, environmental protection division, Georgia Department of Natural Resources, on behalf of the Association of State and Interstate Water Pollution Control Administration:
Statements 2624
Letter supplementing testimony 2643
Lester, David, executive director, Council of Energy Resources Tribes, statement 3415
Li, Vivien, chairperson, New Jersey Sierra Club, statement 1087
McComb, John, director, Washington Office, Sierra Club:
Statement 225
"A Survey of American Attitudes Toward Water Pollution", prepared for the Natural Resources Council of America, by Louis Harris and Associates, Inc., December 1982 227

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, FEBRUARY 23, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 10:10 a.m., in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

The Subcommittee on Water Resources will come to order. Today the Subcommittee on Water Resources is having the first of 15 days of hearings on the Environmental Protection Agency's proposed changes to regulations governing the methods States may use in setting water quality standards. Today we will be hearing from the EPA. The additional hearings will be for outside witnesses and the date for that will be established as soon as practicable in the future.

The proposed regulations we will be hearing about today have received a great deal of attention. They are important because water quality standards will have an increasing role in the water pollution program as EPA finishes its work in establishing effluent limitations guidelines.

The proposal has raised some concerns in a number of quarters, and we are having these hearings to give an opportunity for EPA to describe the proposal and to permit other parties to present their views for the consideration of the committee.

We will want to see whether the program EPA is contemplating is consistent with the objective of the Federal Water Pollution Control Act and whether the States are adequately equipped to carry it out.

The subject of water quality standards has an important bearing on many other issues in the water quality program which we will be examining as a part of our consideration of possible amendments to the act this year. However, today we will be focusing specifically on the water quality standards proposal. We will not attempt to get into all the other issues that we will be examining as a part of our hearings on possible amendments later on.

We are pleased to have with us today Mr. Frederic A. Eidsness, Assistant Administrator for Water at EPA. Before we hear from Mr. Eidsness, however, I would like to defer to my good friend, the

ranking member of this subcommittee, the Hon. Arlan Stangeland, in principle.

Mr. STANGELAND. Thank you. I am pleased to join our colleagues this morning to hear from EPA on the agency's proposed water quality standards regulations. Our national water quality management program is extremely important to the American people, and no subject could be more appropriate for this morning's hearing than what EPA envisions the water quality standards to be in that program.

I would like to welcome Mr. Eidsness back to the subcommittee again and to express my personal disappointment that John Hernandez is unable to be with us because of illness. I hope you will convey to him our wishes for a quick recovery.

Mr. Chairman, both Mr. Eidsness and Dr. Hernandez appeared before the subcommittee on a number of occasions over the past 2 years, and I believe have established a good working relationship over here that we will be able to build upon this Congress.

While we have not always been able to agree upon every issue, I think we have at least been able to discuss Clean Water Act issues in an open, forthright manner. When business is done this way, honestly, openly, and on the record, the strong factual underpinning and philosophical competition of ideas that are needed to make good public policy become a part of the legislative history supporting our actions. I think that is what the process of government is all about.

Before we begin I would like to compliment you, Mr. Eidsness, on a very fine statement and suggest to our newer members that the long statement be studied in some depth. Issues related to water quality standards are fundamental to understanding the statutory scheme set out in the Clean Water Act and the longer statement does an excellent job, in my view, of explaining what water quality standards are, how they operate, and what the agency intends to accomplish in its new regulations.

My only regret is that we didn't have copies of it earlier so more studies could be done before this hearing.

Mr. Chairman, I have used up more than my share of time. It is not me we have come to hear from but Mr. Eidsness. Charles de Gaulle is reported to have said, "One measure of genius is an individual's ability to sustain a great debate."

If that is correct, we have evidence of a true genius testifying this morning because some of these proposed regulations have prompted significant debate. They have very strong supporters and equally convinced opponents. I look forward to receiving and discussing this testimony here this morning.

Mr. ROE. My gracious, thank you very much.

On that score, maybe we should rest our case. Thank you for that very fine opening statement, Arlan, and I feel that sums up what our feeling is.

We have prepared a statement in depth and I have requested the staff to pass it out. I think what is important, before we call our witnesses, is that a number of new members get a definite understanding as to precisely what our interpretation of the 1972 law is. I think your statement speaks to that issue. We can make additional copies to pass out. I do want to pay my personal regards and re-

spects, highest regards to Ray Roberts, our former chairman. Ray stand up and take a bow. We are always glad to have you with us. It is good to be with you today, joining us from Texas.

Ray has been the father of many, many of these very important water resources matters, and it is always good to have him aboard to keep us on the straight and narrow.

Having said that, with all of the members that are here, we would now like to recognize the distinguished gentleman from EPA, Mr. Eidness, who is the Assistant Administrator for Water.

If you would identify your colleagues for the record, we would appreciate that and will proceed from there.

Mr. Eidsness, the full text of your prepared statement will appear in the record at this point.

[The prepared statement referred to follows:]

20-955 O—84——2

Prepared Statement of Frederic A. Eidsness, Jr.

Good morning Mr. Chairman and members of the Subcommittee. I am Frederic A. Eidsness, Jr., Assistant Administrator for Water of the U.S. Environmental Protection Agency. It is a pleasure to be here this morning. I appreciate this opportunity to review with you some of our initiatives to strengthen the effectiveness of the partnership between the States and the Federal government in controlling water pollution and in meeting the goals of the Clean Water Act.

Today, in response to the Subcommittee's request, I will discuss our water quality program and the administrative and regulatory reforms that we have proposed to improve it. I will begin by describing water quality standards, how they are developed, and how they are used for controlling pollution in conjunction with other important requirements of the Clean Water Act. Then, I will focus on the problems that the regulated community, States, and the Environmental Protection Agency have experienced over the last ten years in the development and application of water quality standards. Finally, I will discuss how we are proposing to improve the utility of water quality standards as a

regulatory and management tool in meeting the goals of the Clean Water Act.

In order for the Committee to have a full appreciation and understanding for what EPA is trying to accomplish with respect to water quality standards, it would be appropriate for me to define the two major types of regulatory requirements included in the Clean Water Act. These are the national technology based effluent requirements which EPA establishes and water quality standards which States set and implement.

The Environmental Protection Agency is required to establish uniform national technology requirements which apply to municipal and industrial point sources of pollution. Simply stated, a point source of pollution is a discrete discharge from a municipal sewage treatment plant or a factory. While nonpoint sources of pollution, on the other hand, result from the runoff of water due to normal precipitation from urban areas, from construction sites, and from agricultural and silvicultural operations. For municipalities, the technology based standard is commonly referred to as secondary treatment. For industrial discharges, technology based requirements are referred to as best practicable treatment (BPT), best conventional technology (BCT), and best available technology (BAT). The primary bases for adoption of these requirements are available or demonstrated treatment technologies and costs. These technology requirements are embodied in Federal regulations and are incorporated into NPDES permits.

As you know, EPA is actively developing national regulations to control the industrial discharge of toxic pollutants with the technology based approach. In the past year, we have made substantial progress in promulgating toxic effluent requirements. To date (2/14/83) we have proposed 27 effluent guidelines and have promulgated 13 for the industrial categories included in the NRDC Consent Decree. We will continue this progress by adhering to the court schedule. This has required extensive data gathering and intensive analyses.

Technology based guidelines set uniform national requirements for a specific industrial category. These requirements vary from industry to industry. For example, we regulate a steel industry differently than a textile industry because of the differences in waste that each generates and the technologies which are available to control these wastes. Moreover, even within an industrial category, there are different requirements. The steel industry has 52 subcategories, each of which have somewhat different requirements. Different types of municipal systems also have different technology requirements. For example, lagoon systems are allowed to discharge a different concentration of suspended solid material than are conventional activated sludge treatment plants.

Every municipal and industrial point source discharger is required to meet these minimum technology based requirements with a few limited exceptions. Permits are issued to the owners or operators of municipal or industrial facilities which specify discharge limits in terms of a

maximum concentration (expressed as milligrams per liter) or mass loadings (expressed in pounds per day) or both. Discharge of pollutants from a municipal or industrial facility without a permit or in violation of any of the conditions of a permit (including failure to monitor the discharge and report such monitoring data to the State or EPA) is a violation of the Clean Water Act.

From 1972 to 1977 implementation of BPT regulations are estimated to have significantly reduced industrial discharges of six key pollutants: biochemical oxygen demand (BOD) by 71 percent; oil and grease by 71 percent; dissolved solids by 52 percent; phosphate by 74 percent; and heavy metals by 75 percent.

By 1980 municipal sewage treatment plants were removing substantial amounts of conventional pollutants: approximately 13,600 tons per day of BOD, and 15,800 tons per day of suspended solids. This represents an increase of 65 percent over 1973 levels, and is due in part to a significant increase in the number of POTWs achieving secondary treatment levels, from 40 percent in 1975 to over 75 percent in 1980.

Water quality standards, on the other hand, have a different focus than the technology based requirements. Under Section 303 of the Act States adopt water quality standards as State rules or laws. Water quality standards define the uses to be made of water and the criteria to protect the uses. Uses include public water supply, propagation of

fish and wildlife, recreation, agricultural and industrial purposes and navigation. Criteria are acceptable qualitative or quantitative estimates of water constituents which should ensure that the use is attained.

Currently, all 57 States and jurisdictions have approved water quality standards. For most waters, these standards include a fish and wildlife protection use, commonly referred to as a "fishable" use. Only eight States contain any water bodies which do not have fish and wildlife as a beneficial use. All State standards include criteria for "traditional" constituents such as temperature, pH, dissolved oxygen, fecal coliform bacteria and the "free froms". "Free froms" are general narrative criteria statements directed at controlling aesthetic water qualities such as taste, odor, and color and other elements including settleable solids, oil, and toxics.

Water quality standards serve three important functions under the Clean Water Act. First, they, in effect, establish a goal for a particular stream or water body. This goal is expressed as a use which is to be attained or protected and a level of water quality to be achieved. Second, water quality standards serve as a basis upon which States make management decisions in setting priorities, in developing and implementing nonpoint source control programs and in evaluating progress of water pollution control programs.

And finally, and most importantly, water quality standards serve as a regulatory tool. The technology based requirements for various industrial and municipal categories are applied nationwide without regard to the type of water body or the quality of the water receiving the discharge. Thus, when EPA writes national technology based standards, we do not know whether the pollution reduction resulting from those requirements for a particular stream are adequate to protect designated uses in State water quality standards. In setting technology based requirements, technology and costs are the primary considerations with little emphasis on the receiving water impact. On the other hand, permits written on the basis of water quality standards only consider water quality impacts. Since available treatment technologies or costs are not considered, water quality based permits can have very direct and dramatic affects on reducing pollutant loadings from point source dischargers and on the costs and economic impacts for owners and operators of facilities.

STANDARDS-TO-PERMITS SETTING PROCESS

Mr. Chairman, I would now like to briefly describe how water quality standards are translated into enforceable discharge permits.

As part of a State's water quality management process, water quality standards are set to define the water quality goals of a State

and as such are the foundation of State water quality programs. Section 303(e) of the Act requires State water quality management processes to be described in each State's Continuing Planning Process document. Under Sections 106, 205(g), 205(j), 208, 303 and 305, States and local governments initiate and carry out planning and management activities to establish their water quality goals and standards and to develop programs which will meet them. Water quality monitoring activities are carried out to develop chemical, physical, and biological data to assure that environmental control decisions and priorities are based on sound scientific data.

Water bodies that will meet applicable water quality standards once point sources and non-point sources (BMP's) are controlled to the prescribed technology based levels are called effluent limited segments. On the other hand, water bodies where it is known that water quality will not meet applicable water quality standards after application of the technology based effluent limitations are called water quality limited segments. The water quality based approach applies to the relatively few segments that will not meet water quality standards after installation of the technology based controls. Section 301(b)(1)(C) of the Act requires more stringent controls for these water quality limited segments.

Section 303(d) of the Act requires States to identify waters requiring more stringent effluent limits and to set priorities and calculate the amount of pollutant loads that will ensure implementation

of water quality standards. This calculation is called a total maximum daily load (TMDL). TMDLs are frequently expressed in pounds of materials that can be discharged to the stream in a day and still have the stream meet the criterion and protect the use included in the water quality standard. The State then allocates the TMDL to each discharger, to non-point sources, or to future growth through a "wasteload allocation." The State may reserve some of the stream capacity as a margin of safety to reflect uncertainty in the data. Admittedly there is a considerable amount of predictability and interpretation involved in relating a pollution discharge into a particular water body to the protection of a designated beneficial use based on adopted in-stream numeric criteria. Section 303(d)(1)(C) provides specific instructions on how a State (with EPA's review and approval) is to take into account lack of knowledge concerning the relationship between effluent limitations and water quality. Simply stated this provision of the law clearly indicates that when in doubt err on the side of caution. Specifically, Section 303(d)(1)(C) states "[s]uch (waste) load shall be established at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality." Indeed the "margin of safety" provision of the Act has been incorporated into other aspects of standards adoption and permit writing.

The results of the wasteload allocation are adopted in the water quality management plan for the stream, and are included as enforceable effluent limitations in permits issued to dischargers. These permits are part of the National Pollutant Discharge Elimination

System, or NPDES, and are the legal basis for requiring dischargers to control the pollutant levels in their effluents. All permits are to comply with the applicable water quality standard. Under Section 401(a)(1) of the Act, States certify that the allowable discharges in EPA issued permits comply with State standards.

Let us consider, for example, a small river feeding into a lake with a phosphorus problem. The State water quality standards have established a phosphorus criterion of 0.1 milligram per liter to help prevent eutrophication in the lake. To keep from exceeding this limit, the State calculates that no more than 500 pounds of phosphorus can be discharged to the river per day, given the volume of streamflow available in the river. This 500 pound limit is the total maximum daily load (TMDL). Based on an analysis of point and nonpoint sources on the river, the State decides that two cities located on the river should discharge no more than 250 pounds and 100 pounds of phosphorus per day, respectively, from their sewage treatment plants, leaving 150 pounds for runoff from nearby agricultural areas, expected population growth and an adequate margin of safety. These figures constitute the wasteload allocation for the river. They are established as enforceable limitations in the discharge permits that the State issues to the two cities, and are adopted in the water quality management plan for the river to help guide decisions on nonpoint source controls, and on future growth. This is a very simple example. The calculations become much more complex on large rivers or estuaries with more

dischargers, and with pollutants which change their chemical form in the river, such as oxygen-demanding materials.

PROBLEMS

As everyone knows, the 1972 Amendments to the Federal Water Pollution Control Act added a technology based approach to pollution control. It is frequently forgotten that Congress also strengthened water quality standards. Water quality standards were expanded to cover not only interstate waters but also intrastate waters. Congress also provided a mechanism to enforce all pollution control standards by requiring dischargers to obtain a permit. Prior to the permit program, determinations of compliance and enforcement were carried out through enforcement conferences which were haphazard and unwieldly.

Adding the technology based approach clearly changed the emphasis of the Agency. EPA concentrated its energies and resources on providing scientifically valid, cost effective technology based guidelines and on establishing the National Pollution Discharge Elimination System (NPDES) to control the discharge of pollutants from all point sources. Both were difficult undertakings.

The emphasis given in the 1970's to developing technology based controls and implementing a permit system meant that EPA placed less emphasis on water quality standards and the water quality based approach. States were not provided adequate guidance for establishing

water quality standards and for applying them in a water quality based approach to pollution control.

States used standards as goals and with EPA encouragement set them, with few exceptions, to reflect "the fishable/swimmable" 1983 goal of the Act. However, in doing so, there was little analysis of whether these uses were appropriate for a particular body of water.

Guidance was not provided on the factors to be examined in setting appropriate standards. Furthermore, in somes cases, EPA inappropriately carried over the need for uniformity and consistency in developing technology based controls to encouraging the development of uniform State water quality standards. On the whole, little site-specific analysis was done even though under the Clean Water Act, standards were intended to reflect specific local conditions and priorities. If any site analysis was done, it was primarily an analysis of chemical parameters, such as dissolved oxygen, pH and temperature. Rarely were the physical or biological characteristics of the stream evaluated. Physical and biological characteristics of a stream including flow, substrate and food are critical components in determining whether a stream is "fishable".

States also designated very general aquatic or "fishing" uses in State water quality standards with little or no specificity as to the species to be protected or whether protection also included propagation. Aquatic protection is a broad category which ranges from

providing for the survival of pollutant-tolerant fish to providing for high quality trout streams. Even for a trout stream there are various levels of protection. Is the use to include propagation, or survival only, such as a put-and-take trout fishery? This could make a tremendous difference in treatment costs, particularly if trout propagation is not feasible because of non water quality related factors such a stream flow, or substrate. For example, in a stream receiving 10 MGD of effluent, further treating the effluent for trout propagation could increase the construction costs of waste water treatment by $1.5M and yearly operation and maintenance costs by $50,000 over what would be needed for a put-and-take trout fishery. These additional costs may not make sense and may pose a financial hardship, particularly on a small community.

In addition to the problems of designating appropriate uses in a standard without adequate guidance, EPA required, between 1978 and 1980, that States adopt the Agency's laboratory-derived national Section 304(a) criteria unless the State could adequately justify another number. However, EPA provided no guidance on what would constitute adequate justification. National Section 304(a) criteria do not account for all local factors, which affect the bioavailability or the "harm" a pollutant may cause to aquatic life. For example, in many western streams, the Section 304(a) criterion for copper is inappropriate because of the high suspended solids content. This water quality condition renders the copper biologically inactive. The data base from which the national copper criterion was developed used water

free of suspended solids. Thus, if the national criterion for copper is applied directly in the water quality standard, without modification to reflect the high suspended solids content, a discharger's permit limits for copper on such a stream are likely to be more stringent than necessary to protect the use.

The national criteria, particularly the "Red Book", gave only a single chronic value considered to be fully protective of 95 percent of the species. This is a conservative value because it allows no variations or "excursions" even for short periods of time. The criteria may also be overly conservative if the species tested to derive the value are not indigenous to the waters in a particular State. No guidance or background information accompanied the criteria. Therefore States or permit writers had no basis of scientifically selecting a value protective of particular species or families of fish.

In many cases, the problem is not with the water quality standards per se, but with their implementation into the permit and construction grant processes. Little information was provided to States. As a matter of fact, it was not until five years after the 1973 deadline that EPA complied with Section 304(a)(2)(D) of the Act and published an identification of pollutants suitable for calculating TMDLs to meet water quality standards.

Even then, we issued little technical guidance on how to calculate TMDLs or how TMDLs are incorporated into appropriate models for use in the wasteload allocation process. Models are the tools which are usually used to transform water quality standards into permit limits and design criteria for treatment plants. The proper selection and application of the model is critical to determine the water quality resulting from different treatment levels. Many States use simple mass balance or desk-top models in developing the amount of pollutant reduction necessary to meet water quality standards. Simple mass balance models are appropriate for pollutants such as soluble salts under steady state stream conditions. On the other hand, especially for other pollutants, they are very conservative models because they fail to take into consideration removal mechanisms such as volatilization, biodegradation or settling, and the variable flow of the stream or effluent.

Most models assume a flow condition of the average seven consecutive day low flow that will occur once in 10 years (7Q10). In many western streams this is zero. This means that the criteria could never be exceeded in the effluent itself. In the West, a more appropriate design flow might be the 7Q2, (a flow condition of the average seven consecutive day low flow that will occur once in 2 years), but EPA did not provide the guidance necessary to set appropriate design flows for a particular stream for the level of control actually needed. While margins of safety are required under the Act in the standards to permit process, particularly for complex

toxic effluents, States have not had the flexibility or technical guidance, in the past, to consider site-specific physical, chemical and biological characteristics of the stream.

Thus far, water quality based limitations have not been a major component of permits because of our emphasis on the technology based municipal and industrial components. Only 10-20 percent of the major industrial and municipal permits issued have a water quality based component. Many of these permits were written before the technology based requirements were published and for the most part were based on ad hoc judgments. However, as the technology based requirements are completed and included in the permits, greater emphasis will be placed on including water quality based components in the permit to meet water quality standards. In Fiscal Year 1984, EPA is scheduled to write a number of major industrial permits, about forty percent of which will address significant water quality based concerns. We do not know how many State issued permits will have water quality based components but we anticipate that each year the number will increase. These water quality based permits represent complex situations. Additional guidance is needed on biological testing procedures and selecting an appropriate averaging period (such as 1, 7, or 30 days) for determining compliance with the criterion.

We have seen the problems of unattainable uses, inappropriate criteria or inadequate modeling of the stream for wasteload allocations in Advanced Treatment (AT) project applications for Federal

grants. AT projects are water quality based treatment proposals for publicly owned treatment works (POTW). The pollutants of concern are usually biochemical oxygen demand (BOD), phosphorus, nitrogen and ammonia. As you know, the technology based requirement for POTWs is secondary treatment. The Fiscal Year 1979 Appropriations Committee Report for the construction grants program agreed "that grant funds may be used for construction of new facilities providing treatment greater than secondary only if...the Administrator personally determines that advanced treatment is required and will definitely result in significant water quality and public health improvements."

We have found that many AT project proposals have not been adequately justified. Since 1979, the Administrator has reviewed eighty (80) AT projects; changes were made in 52 percent of the projects. Last year, changes were made in all AT projects reviewed in Headquarters. To date, the proposed AT capital costs for the projects reviewed at Headquarters totals $1.67 billion; $0.82 billion or 50 percent of the projected capital costs have been deferred. In addition, O&M savings are estimated to be $220 million.

As I indicated, there are several reasons for revisions in the AT projects: some related to inadequate justification of anticipated water quality improvements; others related to the excessive design of AT processes. For those projects where there are inadequate water quality justifications, the problem was either with the water quality standard itself or with the application of that standard into the permit and

20-955 O—84——3

construction design processes. For example, secondary treatment frequently ensures sufficiently low concentrations of ammonia to support a warm water fishery (i.e. catfish, bass, etc). However, nitrification (an AT process) to remove ammonia may be needed to protect a cold water or salmonid fishery (trout, pike, etc). Without adequate analyses to show that the stream is or could support cold water fish, nitrification - the AT portion of the project - is deferred. In other cases, criteria were not properly applied. A long term chronic number may have been used with short term low flows. There, the acute value should have been used. Quite often, extremely conservative waste load allocation models were used or, the models were not properly verified and applied to the receiving water. Finally, we have found that many of the AT processes are excessively designed, particularly with the addition of final filtration. This process is generally unnecessary if the plant is properly operated.

Estimates indicate that 30-60 percent of all new facilities may require some level of advanced treatment. The 1982 needs survey projected this AT backlog at $3.77 billion. These figures are highly dependent upon proper use classification since many low and intermittent streams are involved and may not support a fishery use. We estimate that less than 50 percent of the $3.77 billion will actually be needed as States critically evaluate the appropriateness of their water quality standards on water quality limited segments and improve the application of standards into the permits and construction grants processes.

WATER QUALITY BASED APPROACH

The problems that I have just outlined convinced me that EPA had to initiate a number of activities including public education, regulatory reforms and new guidance to effectively implement a water quality based program. Municipalities and industries are installing the technology based controls so we need the mechanisms now and in the years ahead to implement the water quality based approach. The law requires that where the technology based controls are inadequate to meet water quality standards, more stringent controls are to be applied.

As you recall, secondary treatment technology requires an effluent limitation for five day biochemical oxygen demand (BOD_5) and suspended solids (SS) of 30/30 mg/l on a maximum monthly average basis or as 85 percent removal of these parameters, whichever is more stringent. Removing this last fifteen percent comes only at a very high unit cost and pushes the limits of reliable performance. We have a priority project to determine the effectiveness of advanced treatment. Because additional controls may be costly and in some cases the technology is at the edge of reliable performance, we believe that the type of water quality analyses that EPA requires for AT projects is the same type of analyses which are needed in reviewing water quality standards on water quality limited segments.

Passage of the 1981 Construction Grants Reform legislation stimulated our work on the water quality based approach because of a new requirement. This requirement precludes the award of Federal grants for the construction of publicly owned treatment works after

December 1984, unless the water quality standard for the receiving water body has been reviewed and where necessary, revised.

One of my first steps, as Assistant Administrator, was to put into effect a management process to deal with the problems of implementing the water quality based approach to pollution control. In the past, policies, regulations, guidance development and testing programs were developed independently by separate EPA offices. To resolve the problems with the water quality based approach, in a timely fashion, we had to systematically integrate our expertise and resources to resolve the longstanding problems that I have just discussed. A combination of policy initiatives, regulatory reforms and guidance materials were identified and a schedule for their development laid out. I am attaching a copy of this integrated approach, "Priority Work Plan for the Water-Quality Based Standard-to-Permits Project" to my testimony (See Appendix I). With your concurrence, Mr. Chairman, I would like to summarize the key elements. This will provide the overall structure of the water quality based approach which encompasses the proposed water quality standards revisions.

The primary objective of this project is to encourage and assist State water pollution control agencies. This is to be done by providing the tools so that States can write appropriate water quality-based permits, where it is necessary to go beyond technology based controls, in order to protect or restore the designated use; and to help them:

(1) correlate water pollution control requirements for all sources, both point and nonpoint, with actual attainment and restoration of beneficial uses; and

(2) identify whether water pollution control benefits are reasonable compared to the costs and potential environmental tradeoffs of advanced treatment for point sources.

Related objectives are to encourage and help the States to:

(1) assure that limited State and local resources are directed toward the establishment of water quality based controls on a priority, carefully planned basis,

(2) assure adequate control of toxic pollutants,

(3) provide for adequate public input/discussion throughout the planning process, including designation of beneficial uses to be protected, selection of numeric criteria to protect the designated uses, and calculation of TMDLs/WLAs,

(4) assure the availability of adequate site specific data for decision making on designated uses and narrative/numeric criteria, and

(5) provide a quantitative assessment of the relative contributions of point sources and nonpoint sources to impairment of water quality and beneficial uses.

State and local agencies will need to concentrate their efforts on the highest priority segments. This will require close EPA, State, and local coordination. Success depends in large measure on whether EPA's policies and program/technical guidance (as carried out under State policies and procedures), effectively ensure informed responses to the

following key questions for water quality limited water bodies (segments):

(1) What is the use to be protected?
(2) To what extent does pollution contribute to the impairment of the use?
(3) What is the level of point source control necessary to restore or enhance the use?
(4) What is the level of nonpoint source control necessary to restore or enhance the use?
(5) Is there a reasonable relationship between the treatment costs and the benefits of attaining the designated use?

I have also included a flow diagram (Figure 1) which lays out the key elements of the water quality based approach. It is an iterative process. Over time, adjustments are made as standards are reviewed, affirmed or revised, as appropriate, waste load allocation strategies developed, effluent limits and permits issued and the results predicted or observed. The amount of information needed, the sophistication of the analyses and the timing and sequencing of the steps in the process depend on the situation. The process relies heavily on common sense, technical guidance and practical application of limited resources.

To support the major elements of water quality based approach, over the next eighteen months, we will have completed and will have field tested major guidance documents. These guidance documents and supporting tasks are keyed to the element in the process it supports (see Figure 1) and are listed below.

I. Identify Water Quality Limited Segments and Set Control Priorities:

Figure 1

MAJOR ELEMENTS OF THE WATER QUALITY-BASED STANDARDS-TO-PERMITS PROCESS

Provide guidance for identifying and prioritizing water quality limited segments.

II. Review, Affirm or Revise Water Quality Standards:

Issue revised water quality standards regulations and supporting guidance.

Issue water quality criteria guidance and interpretation documents.

III. Develop Water Quality Based Control Requirements:

Revise regulation and supporting guidance for wasteload allocations/total maximum daily loads

IV. Incorporate Identified Water Quality Limited Segments, Priorities, Revised/Reaffirmed Standards, TMDLs, and Effluent Limits into updated Water Quality Management (WQM) Plans:

Provide guidance for updating CPPs and WQM Plans, and priority systems

V. Issue Water Quality Based Permits and Make Water Quality Based Construction Grant Decisions:

Provide guidance for issuing water quality based permits

Issue regulation and supporting guidance for making water quality based construction grant decisions

VI. Monitor Municipal and Industrial Sources for Compliance; Perform Ambient Monitoring to Document Protection of Designated Uses:

Provide Guidance on Water Quality Monitoring and Local Cooperative Monitoring Programs

Issue revised Water Quality Management Regulations and supportive guidance on the overall margin of safety

Provide data management support

As we move forward with the water quality based approach, it is important that the American people understand not only that the water quality based approach is an integral component of the Act's overall approach to pollution control, but also what is meant by the water quality based approach to pollution control. Thus, on October 29, 1982, we published proposed revisions to the Water Quality Standards Regulation with a discussion of the water quality based approach. Water quality standards were presented in the context of the water quality based approach. We wanted to obtain the views and experiences of others in assisting us perfect the design of the water quality based approach.

From the beginning, States played an active role in preparing these proposals. Starting in October 1980, a subcommittee of the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) reviewed five drafts of the Regulation and met with EPA on numerous occasions. In addition to the ten States and interstate agencies serving on the subcommittee, all States received at least two drafts of the proposed revisions. Eighteen States assisted in the development and testing of the guidance supporting the Regulation. Environmental, business and industry groups were also consulted and received drafts of the proposals.

Eleven public meetings were held nationwide to solicit comments. Nine hundred and twenty people attended those meetings. We have received approximately 1400 letters on the proposal and we are

carefully evaluating all of the recommendations. I believe that we have succeeded in stimulating the discussion that we wanted.

Questions have been raised on the feasibility of the water quality based approach in general and specifically on the approaches outlined in the proposed revisions to the Water Quality Standards Regulation. I wish to address these questions directly as a means of clarifying our initiatives for this Subcommittee.

First, based on the number of water quality limited segments, is the water quality based approach realistic? As indicated by State submissions for the 1982 National Water Quality Inventory Report to Congress (See Appendix II), technology-based controls have improved the quality of many of the Nation's rivers and streams. Overall trends toward continuing improvement in water quality are cited by 21 of the 33 States submitting trend information in their 1982 water quality reports. Twenty (20) States also provided estimates of their progress toward the Clean Water Act's 1983 goal of "fishable/swimmable" water quality. These 1982 estimates of waters currently meeting the "fishable/swimmable" goal range from a low of 66 percent of Rhode Island's 329 miles of streams to a high of 97 percent of New Hampshire's 14,500 stream miles. While it should be noted that no precise national conclusions about the percent of waters meeting the goal can be drawn because of varying methods of assessing goal attainment, these estimates do indicate that a majority of the Nation's

waters already meet the 1983 goal, and hence that a relatively small proportion will require additional water quality based controls.

The second question frequently asked is whether resources are available. Our approach is flexible. It encourages the most efficient use of resources by encouraging States to set priorities. Setting priorities is a basic management tool and a necessary step for States to make the best use of limited resources in managing for environmental results.

Let me define what I mean by the term "priority water bodies". Priority water bodies are those water quality limited or effluent limited water bodies for which pollution abatement and control decisions are most needed to prevent or reverse the impairment of a designated use. Factors to be considered in identifying priority waterbodies could include, but are necessarily limited to: the use to be protected; the severity of the use impairment or the severity expected if no actions are taken including human health; and the margin of environmental benefits expected for the resources expended. Once priority water bodies are determined, pollution control actions, such as standard setting, wasteload allocations and permit issuance, should be identified and scheduled.

To support States in their efforts to focus on their priorities, they will no longer be required to review all their State standards every three years. Rather, the selection and review of standards on

priority water bodies will satisfy the requirement of the Act that standards be reviewed from time to time but at least once during each three year period. In fact, standards reviews are a continuous process. However, by focusing on high priority water quality limited segments where the costs or benefits of installing controls are significant, States will be able to collect and analyze the data and information necessary to ensure that standards are reviewed based on adequate data and information.

State water quality agencies should work with other State, Federal, areawide and local planning agencies and the private sector to assist in assembling the data and in performing the analyses. We are encouraging States to develop a coordinated approach to water quality monitoring. Although water quality data is being collected, it is collected by different groups - EPA, Geological Survey, State agencies, municipalities, local and areawide planning agencies, universities and the regulated community - for different reasons. Therefore, there are duplication and overlap as well as missing links in our ability to identify and characterize water quality problems and set priorities. To assist States in establishing a coordinated monitoring program, we are preparing guidance on the technical and institutional factors to be considered in establishing such a program, including the financing of the program by industry and local governments. We have compiled a case study file of more than 80 areas where cooperative monitoring programs have been implemented. We believe that cooperative monitoring programs

are a viable option for States to use in reducing any resource impacts of improving their monitoring programs.

Congress has also made available additional resources for water quality standards reviews through Section 205(j) of the 1981 Construction Grants reform legislation. This section set aside up to one percent (1%) of a State's construction grant allotment for a variety of water quality planning purposes. Although our data are still preliminary, States indicate that they plan to use this money for detailed reviews of their water quality standards and to conduct the type of scientific and technical analyses we recommend.

Based on a study we did of three State water quality programs, it appears that only ten to fourteen percent (10-14%) of a State's water quality program budget, annualized over a three year period, would be required for most States to review their water quality standards on priority water bodies. Although I am sensitive to State resource constraints, I believe 10-14 percent of a State's water quality program budget is a reasonable cost.

There are also other resources available to States. From my personal experience in Colorado, municipalities and industry are willing to assist States in gathering data for intensive water quality standards reviews (See Appendix V for an elaboration of this experience). In discussions with industrial representatives and statements made at the water quality standards public meetings, I

believe industry will assist States. In accepting this assistance, States will need to outline explicit quality assurance/quality control procedures to be followed to ensure the quality of the data. Industry itself recognizes that in order for States to use their data, all relevant data must be submitted and made available to the public. I must stress that the interpretation of the data is the States' responsibility.

At the public meeting on January 20, 1983, in Washington, D.C., I questioned one industrial representative as to whether his company would be willing to assist the States. I would like to quote from the transcript of that meeting.

> "MR. EIDSNESS: Mr. Hansen, before you leave, I have a question just as a point of clarification. To put it in my terms and paraphrase what I think you said, you indicated an interest in working out cooperative agreements with states to support development of site-specific analysis.
>
> "MR. EIDSNESS: As part of the standard review process, do you understand and do you acknowledge and accept that however that may be accomplished, assuming it does occur or may be occurring now, that the responsibility for interpreting such data analysis and setting regulatory requirements rests solely with the states?
>
> "MR. HANSEN: Yes, we understand that. We feel that we have a real interest in developing site-specific criteria. We aren't really quite sure if it is legal or politic to have an agreement with the states. Maybe it would be a cooperative agreement between industries and the data presented to the states. But, in any case, we recognize that they have the power to analyze the data and make decisions from the data that is arrived at."

In the final analysis, it has been my experience that those who bear the costs of implementing control requirements have the greatest

stake in providing the data to be used in the State decision-making process. The State may choose to have the regulated community collect the additional data on a carefully controlled basis.

In addition to the resource questions, another major question raised was whether we have the tools to accomplish this? The process outlined in the proposed rule utilizes the wealth of data, scientific knowledge and methodologies developed over the past ten years. For example, we have a much better understanding of river systems in this country because we have been able to use calibrated and varified models in interpreting the tremendous amounts of monitoring data that have been collected over this period. In the scientific area, we have been able to identify, for instance, the free copper ion as the toxic fraction of total copper that is responsible for toxicity in aquatic organisms. In a different area we are now able to quantify the effect of temperature on the toxicity of ammonia in the aquatic ecosystem. With respect to methodologies, one particularly notable advance has been the development, by the U.S. Fish and Wildlife Service, of the Habitat Suitability Index models which define the characteristics of a water body necessary for a particular species of fish.

The "Standards-to-Permits Process" Work Plan outlines the broad range of technical guidance that we plan to make available to the States. This guidance ranges from performing wasteload allocations for toxic pollutants to analyzing complex effluent bioassays. It also includes guidance on time variable wasteload allocations and permits as

well as flow, temperature, and pH design conditions in wasteload allocations, to list but a few. We recognize that we do not have all the answers nor have we developed all the best tools. But where the science is available, we believe that it should be used in setting appropriate water quality standards. In conjunction with the proposed Rule, we have drafted guidance to assist States in using the scientific and technical analyses for setting uses and criteria on a site-specific basis. We are evaluating this guidance in States that have not previously used the procedures outlined in the guidance to assess their general workability.

Mr. Chairman, I would now like to share with you and members of this Subcommittee a few examples of the use attainability analyses recommended as part of the proposed water quality standards revisions.

One factor frequently ignored in setting uses for a particular site was the physical characteristics of the water body. Certain water bodies lack a proper substrate for fish to spawn, physical barriers such as dams prevent migration of anadromous fish, or natural ambient water temperatures preclude certain species of fish. The U.S. Fish and Wildlife Service is developing a series of Habitat Suitability Index (HSI) models for various aquatic species. The models define the characteristics necessary to support particular species. Factors such as percent of pools and cover, substrate type, velocity, dissolved oxygen, salinity, temperature and turbidity are used to calculate four requisite components for aquatic life: food, cover, water quality and

reproduction potential. The HSI model for channel catfish was used as part of our test case on Salt Creek in Nebraska. The model was applied to three Salt Creek segments to determine if the channelized segment should retain its limited warm water fishery designation or if the segment could support a "valued warm" water fishery. Using the HSI model, the State was able to demonstrate that its original classification of the channelized portion of Salt Creek was appropriate.

On the South Fork of the Crow River in Minnesota, another technique was used to evaluate factors affecting the suitability of the South Fork for fishery and recreational uses. Minnesota compared physical, chemical and biological (species diversity values) factors of the North Fork and Mainstem Crow River to the South Fork. This was done to evaluate the "quality" of the fishery in the South Fork and to isolate those factors affecting the quality of the fishery. The State was able to conclude that, although stressed, there was a definite fisheries value in the South Fork of the Crow River. Game and sport fish were found to be important components of the fishery even though rough fish predominated. Major stress of the fishery occurred at a point source discharge but marshland tillage and agricultural nonpoint source runoff also contributed to the impairment. No change was recommended in the use classification. Reduction in marshland tillage and drainage, implementation of agricultural best management practices and upgrading the point source effluent would all improve the fishery. This standards review provided a rational, scientifically supportable

20-955 O—84——4

basis for the development of a water pollution control program for the South Fork of the Crow River.

The Malheur River, Oregon, illustrates another example of the approach proposed in the revised Rule. The hydraulics of the Malheur River have been extensively altered through the construction of several dams and diversion structures designed to store and distribute water for irrigated agriculture. These dams, as well as others on the Snake River, to which the Malheur is a tributary, prevent natural fish migrations in the River and thus have permanently altered the River's fisheries. At present, the river above Namorf Dam is managed as a trout fishery and from Namorf Dam to the mouth as a warm water fishery. However, the use classification of the latter segment is a salmonid fishery. This use cannot be achieved primarily because of the dams although high suspended solids, warm water temperatures and periodic low flows also contribute to unfavorable water quality conditions for the salmonids. A change in the use to a warm water fishery would only reflect the physical realities. Such a change would not further jeopardize existing aquatic life nor result in any degradation in water quality.

These examples (see Appendix III-Use Attainability Case Studies) show that there are a variety of chemical, physical and biological analyses which can be used to better define the fishery use (the type of species to be protected), to pinpoint the causes of any impairment

in the use and to evaluate the potential of the water body to support a specific use.

Our case studies confirm, in my mind, that States are unlikely to make major changes in uses. In fact, ASIWPCA has gone on record stating that they do not believe there will be major changes in uses unless it can be demonstrated that the standards were inappropriate. Governor Matheson of Utah, Chairman of the National Governor's Association wrote:

> "There have been charges that these proposed modifications will result in "pollution shopping" by industry. I believe that the integrity, sophistication and expertise demonstrated by state water quality programs renders these charges meaningless, and I repeat my assurance that there is no intention to relax the standards in Utah."

In addition to examining the potential of the water body to attain a use, our approach recommends that, where appropriate, the criteria be examined. Under Section 304(a) of the Act, EPA develops and publishes guidance on surface water quality criteria. Criteria are quantitative or qualitative estimates of acceptable concentrations or conditions of water constituents or pollutants in the water. While EPA's national laboratory derived guidance reflects the latest scientific knowledge of the identifiable effects of pollutants on public health and welfare, aquatic life, and recreation, it does not, by its very nature, take into consideration local conditions.

National, laboratory-derived water quality criteria guidance may be under protective or too stringent if: (1) the species at the site are more or less sensitive than those included in the national criteria data set or (2) the water quality characteristics of that site alter the bioavailability and ultimately the toxicity of the chemical.

Site-specific criteria development is justified because species at a site may be more or less sensitive than those in the national criteria document. For example, the national criteria data set contains data for trout, salmon, or shrimp. These aquatic species have shown to be especially sensitive to some chemicals. Since these or other sensitive species may not occur at a particular site, they may not be representative of those species that do occur there. Conversely, there may exist at a site untested sensitive species that are ecologically or economically important and would need to be protected.

Water quality factors have been demonstrated to ameliorate or enhance the bioavailability and subsequent toxicity of chemicals in freshwater and saltwater environments. Hardness, pH, suspended solids and/or salinity influence the toxicity of some heavy metals, ammonia and other chemicals. For some chemicals, hardness or pH dependent national criteria are available for freshwaters. No salinity-dependent criteria have been calculated because most of the saltwater data for heavy metals has been developed in high salinity waters. However, in some estuarine sites where salinity may vary significantly with

seasons, the development of salinity-dependent, site-specific criteria for metals of local interest may be appropriate. Such criteria would be seasonally oriented.

The existing Regulation allows States to set site-specific criteria but does not reference acceptable methods. Our proposal and accompanying guidance describe scientifically valid methods for setting site-specific criteria and our case studies illustrate how this may be accomplished. To assess the workability of this guidance, we are running 17 tests in 15 States on setting criteria for zinc, lead, nickel, cadmium, chromium, copper, chlorine, cyanide, lindane and ammonia. (See Appendix IV-Test Cases for Site-Specific Criteria).

The principal assumption associated with site-specific criteria development is that the species' sensitivity ranking and toxicological effects (e.g., death, growth, or reproduction), derived from appropriate laboratory tests will be similar to those in field situations. Another assumption is that the site-specific criterion, like the national criterion, should protect 95 percent of the aquatic species at the site.

The Site-Specific Guidelines are an attempt to more correctly protect the various uses of aquatic life by accounting for toxicological differences in species sensitivity or water quality at specific sites for designated uses. Modification of the national biological data base and use of bioassay data obtained on resident

species in either laboratory or site water must always be scientifically justifiable and consistent with the assumptions, rationale, and spirit of the guidelines that were used to develop the national criteria.

There are four procedures which are included in our guidance for developing site-specific criteria. State may choose any of these or similar procedures depending on site considerations and resources availability to modify criteria. The procedures for the derivation of a site-specific criterion are:

A. Recalculation procedure to account for differences in resident species or families sensitivity to a chemical.

B. Indicator species procedure to account for differences in bioavailability, and therefore toxicity, of a chemical due to water quality variability.

C. Resident species procedure to account for differences in resident species sensitivity and differences in the bioavailability, and therefore toxicity, of a chemical due to water quality variability.

D. Heavy metal speciation procedure to allow the comparison of ambient soluble or biologically available metal concentrations to Section 304(a) criteria.

To further assist States we have recalculated the aquatic life criteria for 21 toxic pollutants on a State-by-State basis using the resident family recalculation procedure (Procedure A that I just mentioned). In addition to providing guidance on setting site-specific criteria, we are improving the scope and usability of national criteria documents.

First, we have developed water quality criteria documents for 64 classes of toxic pollutants. Now, we are developing companion documents that summarize and explain background data for States and permit writers. By summarizing background data on growth impairment and on mortality for short term, intermittent or long term exposures, criteria will be more reflective of the actual uses assigned to the water body.

As we revise the criteria documents, we are providing two numbers in the criteria guidance - an acute number and a chronic 30 day average value. The acute value allows short excursions above the chronic value. In a 30 day period, there can be no more than a total of 96 hours that the criterion (an acute value) is above the chronic value. These excursions allow modest variations in effluent flow without adverse impacts on aquatic life.

The revised criteria documents will also contain site-specific information. For example, the revised ammonia criterion will include different recommended values depending on changes in pH and temperature.

Besides the questions on resources and the availability of tools to accomplish what is proposed, we received many comments on our focus on uses particularly in relationship to high quality waters. The

proposed rule focuses on the uses to be made of the water. It is evident from research and experiences gained over the years in implementing water quality standards that physical and biological as well as chemical data is appropriate in the determination of an appropriate water quality standard. For this reason we proposed a new conceptual approach which focuses on uses themselves rather than on purely water chemistry.

In this regard, we received substantial comment on the fact that the proposed Rule no longer provides special protection for high quality waters. High quality waters are those waters whose quality is better than that needed to protect a fish, wildlife or recreation use. The current requirement specifies that a public hearing must be held before a State allows for water to degrade to the point of impairing the use. This is an issue of great concern to the public that will be addressed as we revise the Rule. I would appreciate the views of this Subcommittee.

Another provision of our proposed regulation that received substantial public comment was the benefit-cost assessment. We believe that economic and social costs are a legitimate consideration in the standards setting process. The existing Rule states that changes in uses could only be made if, among other factors, there would be "substantial and widespread" economic impact. We believe the test for this is too stringent as a uniform national requirement. The test is that:

"The adverse economic and social impacts resulting specifically from imposition of the controls, and reflected in primary and secondary unemployment impacts, plant closures, changes in governmental fiscal base, and other area economic indicators, are substantial and widespread in comparison to other economic factors affecting the area's economy, to national economic conditions and fluctuations, and can be expected to persist for periods longer than provided for by adjustment payments such as unemployment compensation; and they are detectable in an area appropriate for measurement, at least as large as a county or SMSA and, if appropriate, any larger economic areas such as defined by the Bureau of Economic Analysis, U.S. Department of Commerce. In making a determination of substantial impact, the positive economic and social impact of enhanced water quality must be evaluated."

We were looking for an alternative, preferably one that was used elsewhere in the Act. Although used in a different context, section 302 does require a balancing of economic and social costs and economic and social benefits to determine whether there is a reasonable relationship between the two in establishing more stringent limitations. The Rule, as proposed, allows, but does not require, States to conduct a benefit-cost assessment in determining whether there is (or is not) a reasonable relationship in requiring more stringent controls after meeting the technology based requirements, to achieve water quality standards. This led people to believe that a benefit-cost ratio would be the basis of a water quality standards decision. This is not what we have in mind. Rather, we wanted a process that provides State decision makers and the public with information on impacts - the environmental and economic gains and the costs of the standards decision. It is important to recall that most State standards are adopted by independent rulemaking bodies appointed by the Governor. These rulemaking bodies represent a broad cross

section of interests. Just as Congress makes tradeoffs, so must these rulemaking bodies. Thus, what we had in mind was a "common sense" approach for determining what is economically attainable at a specific location. This is similar to what at least 15 States use as part of their water quality standards setting process.

CONCLUSION

As I noted earlier, Congress designed a partnership between EPA and the States in carrying out the Clean Water Act. EPA is responsible for the technology based approach. EPA develops uniform technology based effluent guidelines to ensure a minimum level of treatment nationwide. States have primary responsibility for water quality standards and the water quality based approach.

It is within this framework that EPA revised the water quality standards regulation. States set their own water quality standards by deciding the uses to be made of the waters and by setting criteria to protect those uses. EPA's responsibility is to ensure that State standards "protect public health or welfare, enhance the quality of water and serve the purposes of the Act". We believe this to mean that in reviewing State standards, EPA must carefully review any changes that might in any way adversely impact public health or welfare, the quality of water or the goals of the Act. States will have to demonstrate that any lowering of their water quality standards is appropriate and scientifically valid. EPA will critically evaluate the

analyses States submit as justification for (1) changes in criteria which might adversely affect designated uses, or public health or welfare: (2) uses which appear inconsistent with Section 303(c) of the Act; or (3) uses which might preclude attainment of the goals of the Act where these uses are attainable. In carrying out these responsibilities, EPA will work closely with States in supplying them with the latest information on criteria and methods to evaluate the attainability of uses. In this way we believe that we will be assisting States to set appropriate water quality standards, rather than setting State water quality standards for them.

Mr. Chairman, this concludes my statement. I would be happy to answer any questions that either you or members of the Subcommittee may have.

NOV 8

APPENDIX I

OFFICE OF WATER
US ENVIRONMENTAL PROTECTION AGENCY
FY 1983 PRIORITY PROJECT SUMMARY STATEMENT

WATER QUALITY-BASED STANDARDS-TO-PERMITS

A) Project Objective -

The objective of the project is to develop a consistent framework for EPA's regulations, policy, and guidance governing water quality-based controls. The project involves all steps in the "standards-to-permits" process, including: identifying water quality limited segments, setting priorities reviewing and revising (or reaffirming) water quality standards, establishing wasteload allocations to implement the standards, incorporating these wasteload allocations into NPDES permits and construction grant decisions, and performing ambient and compliance monitoring to protect and maintain the designated beneficial water uses.

B) Project Tasks and Products -

Major tasks are listed below with some example products and completion dates:

1) Project Implementation and Management

2) Provide Guidance for Identifying and Prioritizing WQL Segments: Guidance for priority waterbodies (3/83); Screening manual for conventional and toxic pollutants (2/84)

3) Issue Revised Water Quality Standards Regulations and Supporting Guidance: Revise WQS Regulation (7/83)

4) Issue Water Quality Criteria and Implementation Documents: Dissolved oxygen guidance (4/83)

5) Revise Regulation and Supporting Guidance for Wasteload Allocations/Total Maximum Daily Loads: WLA guidance for streams and rivers (11/83); Guidance on Biomonitoring techniques (12/83)

6) Provide Guidance of Updating CPPs, WQM Plans and Priority Systems: FY-83 guidance on CPP and WQM plan updates (1/83); Guidance on State priority systems construction grants (12/82)

7) Provide Guidance for Issuing Water Quality-Based Permits: Draft guidance for selecting 1-, 7-, 30-day permit averaging periods (8/82)

8) Issue Regulation and Supporting Guidance for Making Water Quality-Based Construction Grant Decisions: POTW advanced treatment funding policy (12/82)

9) Provide Guidance of Water Quality Monitoring and Local Cooperative Monitoring Programs: Local user guidance (6/83)

10) Guidance on the Overall Standards-to-Permits Process: Promulgate revised WQM Regulations (4/83); Guidance on overall margin of safety (9/84)

11) Provide Data Management Support for the Standards-to-Permits Project: Complex Effluent toxicity information system (12/82); Reach file water quality analytic capabilities (12/84)

C) Project Management -

Lead Office: Monitoring and Data Support Division
Office of Water Regulations and Standards

Project Coordinator: Fred Leutner (FTS 382-7040)

A group consisting of the division directors from seven Headquarters divisions (Monitoring and Data Support Division, Criteria and Standards Division, Office of Analysis and Evaluation, Water Planning Division, Facilities Requirements Division, Permits Division, and Enforcement Division) acts as the focal point for overall coordination and implementation of this project. Regional Offices, together with the Standing Work Group on Water Quality Monitoring and Wasteload Allocations, will review the projects workplan and resulting outputs. The lead Regional Divisions are: Region IV - Environmental Services Division, Region V - Water Division, Regions VI - Water Division, and Region VIII - Environmental Services Division.

Interested groups and individuals can participate in this project though the standard Agency process for review of proposed regulations or by commenting or guidance documents mentioned above.

I. Introduction

The purpose of this workplan is to recommend an EPA Headquarters policy and guidance framework for helping to ensure cost-effective State and local action on developing site-specific water quality standards, total maximum daily loads/wasteload allocations (TMDLs/WLAs) and water quality-based permits, also, for making associated construction grant decisions (e.g., recommendations on funding of construction grant applications). The workplan clarifies EPA, State, and local responsibilities. The workplan also includes project resource requirements, and implementation schedules for the several EPA Headquarters tasks. The major elements of the water quality-based standards-to-permits process are shown on Figure 1.

The process used in developing this priority workplan is as follows:

- o We first identified key statutory, regulatory, and administrative requirements that may affect the form and timing of actions needed.
- o We next identified key questions which need to be addressed in order to fulfill these requirements.
- o We set initial priorities for resolving these questions based on our understanding of program needs of the Regions and States to implement their programs.
- o For each key question, we determined what type of policy statement or guidance (program or technical) would be needed.
- o We then developed a workplan which will enable EPA to meet the above prioritized requirements, and which allows adequate time for review and consensus building with interested parties.

As a next step, we will be refining this analysis of program priorities to reflect additional information on State/Regional needs and resource constraints.

In many cases, policy and/or guidance has already been issued. The workplan takes into account the following major items which have already been issued or are in various stages of completion:

- Revision of WQM regulations (40 CFR Part 130, Proposed)
- Revised WQ standards (40 CFR Part 131, Proposed)
- Revised construction grant regulations (May 12, 1982, 40 CFR Part 35, interim final)
- Second round industrial permits policy (June 2, 1982)
- Advanced treatment funding policy
- Preliminary concept paper on secondary treatment redefinition
- Draft proposed rule on funding on chlorination facilities
- Section 305(b) guidance

Figure 1

MAJOR ELEMENTS OF THE WATER QUALITY-BASED STANDARDS-TO-PERMITS PROCESS

II. Issue/Problem Statement

With the nearing completion of effluent guidelines and the application of technology-based controls, EPA will now give more emphasis to the implementation of water quality-based approach to pollution control. The water quality based approach will allow States to focus on their priority water bodies and, when necessary, provide water quality protection beyond what will be achieved through technology-based controls.

Much has already been done in developing and implementing WQ-based controls. A majority of the States have developed and are presently developing a large number of water quality-based controls, at least for dissolved oxygen, ammonia and nutrients. This level of activity is expected to continue since WQ analyses are needed for construction grants projects, e.g., AT reviews; consideration of applications for redefinition of secondary treatment; issuance of second round NPDES permits; development of seasonal or other innovative permits; etc. In addition, as BAT technologies are becoming defined and as a new control techniques become available, States will need to begin developing WQ-based toxic controls.

Although States have generally made good progress in developing water quality based controls, several areas are of concern:

1. The States, in general, are not yet providing water quality based controls for toxics. Site-specific toxic pollutants generally are not included in State numerical water quality standards and field validated biomonitoring/bioassay techniques and toxicant water quality models generally are not yet available. EPA guidance and assistance is needed to improve State capabilities in this area.

2. The technical basis of some of the existing and on-going WQ-based controls could be improved. For example, existing water quality standards may include designated uses unrelated to actual or potential uses and/or criteria to protect designated uses may be unrealistically stringent. Numeric criteria for protecting designated use are often obtained from secondary sources (e.g., EPA's Red Book) without adequate consideration of local, site specific conditions; such criteria may be overly restrictive, even allowing for necessary margins of safety. Also, existing techniques for developing individual effluent limits, i.e., WLAs, may be based upon overly stringent design flows and focus on individual dischargers rather than considering other discharges as needed for calculating basin-wide TMDLs. As a result of these various factors in some cases there may be no reasonable relationship between NPDES permit effluent limits (EL) for advanced treatment and water pollution control needs to protect actual uses. Costs for complying with unrealistic ELs may be excessive and not related to measurable environmental, social, or economic benefits.

In addition to addressing the problems identified above, many of the products of this work plan are also needed in those cases where the existing water quality standards and water quality analyses are appropriate.

III. Project Objectives and Approach

The primary objective of this project is to encourage and assist State water pollution control agencies by providing the tools so that States can write appropriate water quality-based permits, where it is necessary to go beyond technology-based controls, in order to protect or restore the designated use; and to help them:

(1) correlate water pollution control requirements for all sources, both point and nonpoint, with actual attainment and restoration of beneficial uses; and

(2) assure that water pollution control benefits are reasonable compared to the costs and potential environmental tradeoffs of advanced treatment for point sources.

Related objectives of this project are to encourage and help the States to:

(1) assure that limited State and local resources are directed toward establishment of water quality based controls on a carefully planned, prioritized basis,

(2) assure adequate control of toxic pollutants,

(3) provide for adequate public input/discussion throughout the planning process, including designation of beneficial uses to be protected, selection of numeric criteria to protect the designated uses, and calculation of TMDLs/WLAs,

(4) assure availability of adequate site specific data for decision making on designated uses and narrative/numeric criteria, and

(5) provide a quantitative assessment of the relative contributions of point sources and nonpoint sources to impairment of water quality and beneficial uses.

Achievement of the first listed objective will be essential because State and local resources are simply unavailable for effective action on all WQL segments simultaneously. Therefore, it is recommended that, within each planning period, State and local agencies concentrate their efforts on the highest priority segments, and defer substantial action on lower priority segments. This will require close EPA, State, and local coordination. Success of the project will depend on whether EPA's policies and program/technical guidance effectively ensure positive responses to the following key questions for water quality limited (WQL) water bodies (segments):

20-955 O—84——5

(1) What is the use to be protected?

(2) To what extent does pollution contribute to the impairment of the use?

(3) What is the level of point source control necessary to restore or enhance the use?

(4) What is the level of nonpoint source control necessary to restore or enhance the use?

(5) Is there a reasonable relationship between the treatment costs and the benefits of attaining the designated use?

Water quality planning develops responses to the above questions and usually includes, as indicated above, a discussion of costs and benefits. Such planning is a focal point of the water quality-based standards-to-permits process and should be considered as a cost-effective and beneficial alternative to immediate implementation/enforcement of existing, often unrealistic water quality standards.

Given several objectives (listed above) of this project and the need for positive responses to the water quality planning questions, the recommended approach will encourage and help the States to respond cost-effectively to the several major elements of the water quality-based standards-to-permits process as shown on Figure 1. Procedurally, as shown in Figure 2, this approach would recommend that for priority waterbodies, States should make four decisions:

(1) For each priority waterbody, the State water pollution control agency should decide if there is a need for controls beyond levels mandated by the technology-based floor, e.g., secondary treatment and BAT. If not, technology-based controls should be implemented.

(2) If WQ-based controls are needed for a particular priority waterbody, then the State should decide if sufficient site-specific data are available to answer the five key questions listed above.

(3) If sufficient site-specific data are not available, the State should decide if it is able to provide more time for data collection and analysis. If so, data collection would proceed and the questions answered. Local cooperative monitoring programs should be used to collect the needed data, where feasible. If the State does not provide additional time for data collection, the State would proceed to implement WQ-based controls with a margin of safety sufficient to compensate for the lack of site-specific data.

Figure 2. Suggested Process for Establishing WQ-Based Control in Priority Waterbodies.

(4) If sufficient site-specific data are available, the State should decide if the existing WQ standards are appropriate. If not, then the State should consider revising the standards. Once standards are revised, the State would implement the site-specific WQ-based controls.

(5) Once the controls are in-place, follow-up monitoring should be done to ensure that the designated uses are attained. Local cooperative monitoring programs should be considered as a means of obtaining this data.

Once the State makes its decisions on a priority waterbody, the State would:

(1) submit the WQL segment identification and priorities, revised/reaffirmed standards, TMDLs, and WLAs to EPA for approval, and

(2) Incorporate the approved standards, TMDLs and WLAs into the States' WQM plans. (Note that section 303(d) requires EPA to designate WQL segments and establish TMDLs if the State submittal is disapproved.)

Following are several considerations significant to the implementation of this approach:

(1) Site-specific numeric criteria often can be established, using available technologies, for conventional and many toxic pollutants. Such site-specific criteria may be less restrictive than the section 304(a) national criteria.

(2) BAT guidelines will be published for all major industrial categories during FYs 1983 and 84. Under the Second Round Industrial Permitting Policy. permit issuance to affected industries should be focused on the highest priorities.

(3) In many cases, effluent limits, i.e., WLAs/TMDLs, can be established from pollutant-by-pollutant calculations or in the case of toxic pollutants may be calculable from biomonitoring (biological surveys and bioassays) involving whole effluents.

(4) Nonpoint pollutant sources contributing to use impairment, if any, should be determined as an essential element of the water quality analysis for all priority WQL segments.

(5) The State section 305(b) reports should serve as the primary vehicle for communicating:

- Identification of WQL segments and priorities
- TMDLs, WLAs, and priorities for implementation.

It is essential to understand that, for many WQL segments, the optional water quality planning analyses will be resource intensive. Site specific information is required for substantial responses to each of the five key questions. In addition to this "data burden", the States may feel burdened by the large number of policy and guidance documents generated by EPA Headquarters to "help" them implement the water quality-based standards-to-permits approach. Therefore, this approach includes a recommendation (included in Task 9) that local (municipal and industrial) resources be committed to development of the data base needed for local decision making. Participation by local dischargers in cooperative local monitoring programs will help to minimize the State resource burden, also, this will help ensure active local participation in discussions of beneficial uses, necessary levels of protection, costs and benefits of use attainment, etc.

EPA must stress that, while the Clean Water Act requires the WQ-based controls be established where necessary to meet water quality standards, the specific water quality-based standards-to-permits process here is generally a voluntary, optional approach but with substantial, potential benefits to State and local interests. Finally, we need to understand that implementation of this approach will take considerable time both because of State and local resource limitations and because of the complexity of the decision making process.

IV. Key Timing Requirements

The Clean Water Act and its associated regulatory structure establish the framework within which technology-based and water quality-based controls will be implemented. This workplan focuses on establishment and implementation of water quality-based controls. There are relatively few key timing requirements imposed on EPA, States, and the regulated community to implement the water quality-based standards-to-permits project. The key requirements we have identified are as follows:

Finite date imposed by statute or regulation

1. Review/revise water quality standards for construction grants

   - Section 24 Municipal Waste Treatment Construction Grants Amendments-December 29, 1984

2. Compliance

   - Section 21 Municipal Waste Treatment Construction Grants Amendments-July 1, 1988 (Only for POTWs with 301(I) waivers)

     Note: Most POTWs still have a 1977 compliance date.

Cyclic Demand Imposed by Statute

1. Certification of WQM plans-annual

   o Section 303 (e), Section 208(b)(3)

   2. Review/revise WQ standards-triennial

      a. Desginated uses

      b. Criteria (Statewide, site-specific)

         o Section 303(c)

         o Also has administrative date imposed-OWOGAS-1983 (priority waters)

3. Section 305(b) requirements - biennial

   a. State Section 305(b) reports

   b. National water quality report to Congress

      o Section 305(b)

4. Section 106 work plan - annual

      o Section 106

V. Important Questions to be Addressed

The purpose of this section is to focus attention on important questions related to the water quality-based standards-to-permits project where implementation problems can arise. Such questions should be addressed by EPA's policy and guidance documents. The questions listed below are based on the following:

- Discussion with Regions and States
- Higher management's concerns
- Congressional concerns (e.g., 1981 amendments, Congressional inquiries)
- Regulatory and administrative requirements
- Needs of various program areas (e.g., NPDES permits, construction grants)
- Experience from ongoing program products (e.g., AT project reviews, WQM Regional reviews, OWRS "white paper" on WLAs/TMDLs).

These questions were organized into three priority groups:

Group 1. (Highest Priority) Those for which policy/program guidance and technical guidance are needed in advance of the FY 84 Regional/State program planning cycle (February 1983).

Group 2. (Medium Priority) Those for which guidance is strongly needed (preferably in FY 83), but which are not needed prior to the FY 84 planning cycle or for which technical/scientific material will not be available in time to meet a February 1983 date.

Group 3. (Lower Priority) Those for which guidance is desirable, but is less urgent and can be issued in FY 84-FY 86.

The questions are shown on Table 1.

TABLE I
KEY QUESTIONS TO BE ADDRESSED

GROUP 1 (February 1983)

A. Priority Waterbodies

Procedural Questions:

- How should section 303(d) priority waterbody (segment) rankings be related to priority permit lists, priority construction grant project lists, priority pollutants (toxicants), etc. to form an over-all system?

Technical Questions:

- What techniques are available to help screen and rank priority waterbodies with conventional or toxic pollutant problems?

B. Revise/Modify Water Quality Standards

Procedural Questions:

- How should criteria for toxic and conventional pollutants be developed to be more readily adaptable to permitting and other implementation programs?

Technical Questions:

- What procedures and technologies are available and should be used for developing site-specific criteria and/or modifying Section 304(a) national criteria for toxic and conventional pollutants consistent with local conditions?

C. TMDLs/WLAs

Procedural Questions:

- What constitutes adequate and acceptable TMDLs/WLAs for toxic and conventional pollutants?
- What submissions to EPA are required?
- How should revisions to TMDLs/WLAs be submitted?
- What priorities should be followed in performing TMDLs/WLAs for toxic and conventional pollutants?
- How should TMDLs/WLAs be performed between States with common waters?

TABLE I, Cont'd.

Technical Questions:

- o What design conditions (flows, temp, pH) are acceptable?
  - Does the WLA consider the effect of changes in effluent quality on model parameters and assumptions?
  - What is the likelihood of the critical conditions (e.g., flow, temp, pH) occuring simultaneously?
- o What constitutes an acceptable WLA for BOD/DO/NH_3 in simple systems (i.e., simplified method) or complex systems in rivers and streams?
- o What constitutes an acceptable WLA for BOD/DO and for eutrophication in lakes and impoundments?
  - Have the water quality inputs of algae and rooted aquatics been adequately considered in the WLA?
- o What is the appropriate permit averaging period (i.e., 1-, 7-, 30-days)?
- o What guidance should we provide on modeling toxic pollutants and developing their WLAs?
- o What guidance should we provide on the bioassay/biosurvey approach to developing toxic WLAs?

D. Water Quality Based Permits and Construction Grant Decisions

Procedural Questions:

- o What is EPA's program policy and direction for issuance of the second round of NPDES permits?
- o What is EPA's general policy for the review of proposed POTW advanced treatment facilities?
- o What is EPA's funding policy for the construction of POTW chlorination facilities?
- o What procedures and criteria should be used for the review of grant applications for funding CSO facilities construction?

TABLE I, Cont'd

Technical Questions:

- o How do permit writers set limits for toxic substances, where:
  - no numerical water quality standards exist?
  - no TMDL/WLA is calculable?
  - the complexity of effluent(s) rules out using the chemical-by-chemical approach?
- o Can a permit writer use effluent toxicity data to derive permit limits? If so, how?

E. Monitoring Program Guidances

Procedural Questions:

- o What is EPA's monitoring strategy and what are the State, local and EPA roles?
- o How can local resources be used for ambient monitoring?

Technical Questions:

- o Does EPA have a data management system, with analytical capabilities to support water quality based decision making?

GROUP 2 (FY-1983)

A. Revise/Modify Water Quality Standards

Procedural Question:

- o What procedures should be used for establishing site-specific criteria or modifying section 305(a) national criteria for the control of toxic pollutants?

B. TMDLs/WLAs

Technical Questions:

- o What constitutes an acceptable WLA for nutrient and eutrophication impacts in rivers and streams?
- o What constitutes an acceptable WLA for toxic substances in rivers and streams?

- o What are the important factors (qualitative and quantitative) influencing the margin of safety associated with each step of the standards to permits process?

- o What guidance should be provided on developing innovative WLAs for permits.

GROUP 3 (FY74-75)

A. Over-all Standards to Permits Process:

Procedural Question:

- o What key pieces of guidance are necessary to implement a minimally acceptable standards to permits process?

B. TMDLs/WLAs:

Technical Questions:

- o What constitutes an acceptable WLA for BOD/DO and toxic priority pollutants in estuaries?

- o What constitutes an acceptable WLA for nutrient and eutrophication impacts in estuaries?

- o What design conditions are acceptable for effluent flow and rate constants?

C. Ambient Monitoring Strategy and Guidance

Technical Questions:

- o How should ambient monitoring programs be designed:

  - to document water quality improvements due to individual water pollution control actions?

  - to document water pollution control impacts on designated uses?

  - to document trends for entire water quality limited segments?

VI. Workplan Implementation

The proposed workplan is capable of meeting the requirements laid out in the preceding sections. This section discusses our approach toward managing the Water Quality-Based Standards-to-Permits Process, resources and priorities, and some implementation issues.

1. Project Management

To act as the focal point for overall coordination and implementation of this project plan, a Water Quality Division Directors Group has been formed. This group consists of a chairman (Fred Leutner) and the directors of seven participating divisions (Monitoring and Data Support Division, Criteria and Standards Division, Office of Analysis and Evaluation, Water Planning Division, Facilities Requirements Division, Permits Division and Enforcement Division). The functions of the group are to (a) assist the Office of Water Regulations and Standards in revising and implementing the project plan, (b) oversee and coordinate implementation of the plan, including tracking milestones and resource utilization, (c) identify implementation problems and recommended solutions to the Office Directors, (d) identify areas requiring policy or management decisions and ensure that they get raised to the appropriate level; and (e) coordinate related activities such as research requirements, budget development, operating guidance development, and Regional oversight.

Regions will receive a Key oversight role. This will be initiated during the project workplan development. The four lead Regional Divisions are as follows:

Region IV - Environmental Services Division,
Region V - Water Division,
Region VI - Water Division,
Region VIII - Environmental Services Division

They will review this priority project workplan, subsequent workplan revisions, and project outputs.

An accounting system for tracking milestones, progress, and accomplishments will be developed.

2. Resources and Priorities

A necessary and preliminary step to providing practicable guidance to the States on the standards-to-permits process is a description of the relative project priorities and an analysis of the resources available to meet these priorities. The attached workplan outlines tasks necessary to accomplish this. The objective is to provide options to the Office of Water for priority setting within the standards-to-permits process.

3. Implementation Issues

(a) Level of review

The attached workplan generally assumes that EPA guidance products prepared by OWRS will go through several steps of review:

a. Internal program office (OWRS) review
b. Review by other program offices within OW
c. Regional coordinators review
d. ASIWPCA review
e. Standing Work Group review
f. OW Policy Review Group (PRG)
g. Additional steps (e.g. Red Border) determined PRG
h. Issuance by OD(s) or AA

If all of these steps are followed (especially steps c, d, and e), we can build a certain amount of consensus behind the proposed approach and increase the likelihood of responsive implementation. We believe the additional review time incurred is worthwhile, and it can be limited by imposing appropriate deadlines for comments.

(b) lack of field testing

Some of the techniques upon which the standards to permits process is based have not been carefully verified by extensive field testing or case studies; therefore, we will need to expect some changes in the guidance as we gain more experience. Examples of such techniques include applying water quality models for toxic substances, and developing wasteload allocations by the general toxicity (bioassay/biosurvey) approach. During this implementation phase, in addition to adjusting the guidance a required by new data, we will also carry out, to the extent feasible, field testing and case studies.

VII. Task Assignments and Division of Responsibilities

State Responsibilities: The States are the primary implementors of the standards-to-permits process. Although the Clean Water Act requires EPA to provide general oversight and review of certain program actions, States are responsible for identifying priority waters, developing water quality standards and wasteload allocations/total maximum daily loads, and incorporating these water quality based limits into permits. Also, the States are responsible for developing construction grant priority systems and priority lists. The States are responsible for issuing NPDES permits and recommending grant approvals, when these programs have been delegated, and for compliance monitoring and appropriate enforcement actions.

Local Role: EPA encourages local participation in the standards-to-permits process. Involving the regulated community in the process will ensure that States have access to additional existing data. As described above, EPA should encourage cooperative data collection and analysis efforts, leading to development of a better data base and better decisions. An open process attracts relevant information and promotes review of the technical background and policy assumptions made. The State or areawide agency responsible for the planning may experience substantial cost savings since it is often in the interest of the regulated parties to provide relevant data. Also, many municipalities will have a vested interest in the process because they pay for 100% of POTW O&M costs and an increasing share of the construction capital costs. Finally, open public review of the process will lead to a wider appreciation of its validity.

Another advantage is that, by placing the water quality-based standards-to-permits decision making in the planning context, the assumptions on which water quality-based controls are developed can be examined more thoroughly; also, the public can examine the costs and other consequences of meeting water quality goals and objectives. EPA expects that developing water quality-based controls in the planning process will result in fewer legal challenges than if calculations are completed without extensive public debate.

EPA Role: Under the Clean Water Act, EPA is required to carry out a number of activities involved in preparing national assessments and in implementing water quality and technology based controls. As noted above, the EPA Regions are also required to overview State implementation of the Act. Headquarters responsibilities for carrying out the individual components of this priority plan are as follows:

- Monitoring and Data Support Division, OWRS: Over all coordination and lead on standards-to-permits process, identification of priority waterbodies, development of WQ-based controls using pollutant-bypollutant and bio-monitoring techniques (i.e., development of total maximum daily loads/wasteload allocations), and monitoring the effects of controls (before and after studies).

- Water Planning Division, OWPO: Development of Water Quality Management Regulations and Nonpoint Source Program.

- Office of Analysis and Evaluation, OWRS: Budget Office for OWRS, coordination of Regional OWOGAS reviews.

- Enforcement Division, OWEP: Coordination of compliance monitoring, with priority waters.

- Criteria and Standards Division, OWRS: Water quality criteria and standards.

- Permits Division, OWEP: Development of interim guidance on EPA Regional use of water quality permitting procedures for toxics (with MDSD), direct research and provide guidance on the application of biological screening procedures in permits, development of complex effluent toxicity data base, and guidance on issuance of NPDES permits.

- Facility Requirements Division, OWPO: Construction grants, including advanced treatment (AT) reviews (with OWRS), AT policy, AT review technical guidance, revised secondary treatment definition regulations, construction grant priority systems, river reach studies for grant priorities, and POTW construction before-and-after studies (shared lead with MDSD).

VIII. Products/Outputs

Each of the OW program offices has participated in the development of this workplan. The ORD has also participated and an analysis of ORD contributions has been prepared. Discussions among the several offices plus a careful analysis of FY 83 operating plans and FY 84 program plans have demonstrated the existence of planned outputs/products responsive to each of the overall project objectives. Therefore it will be necessary only to organize and manage completion of the planned activities so that the Regional Offices and State agencies have necessary guidance available for timely and effective project implementation. As part of the on-going project implementation, the completed and planned products will be carefully analyzed for consistency with project objectives, timeliness, costs and priorities to confirm that there are no major gaps in the needed guidance.

Table 2 lists workplan tasks consistent with the project flowchart elements of Figure 1. Each task is a key element in the implementation of the water quality-based standards-to-permits project. Each of the eleven tasks is detailed in Attachment A, which provides a description of the tasks: purpose, method, end products, subtasks, and responsible division(s). Each subtask is further described by subtask summary sheets, which give the following information:

- Task (number and name) of which the subtask is a part,
- Subtask (letter and name),
- Regulations supported by the subtask,
- Office, division, and individual responsible for the subtask,
- Purpose and description,
- Schedule,
- Intended audience and agency consultation,
- Resource needs,
- Contractor support,
- Nature of policy decisions needed by AA,
- ADP support requirements.

These subtask summaries are on file with the MDSD and the divisions responsible for doing the work. Attachment B is a sample subtask summary.

TABLE 2. MAJOR ELEMENTS OF THE WATER QUALITY-BASED STANDARDS-TO-PERMITS PROCESS

I. Identify WQ Limited Segments and Set Control Priorities;

Task #2*: Provide Guidance for Identifying and Prioritizing WQL Segments.

II. Review and Revise (or Reaffirm) Water Quality Standards

Task #3: Issue Revised Water Quality Standards Regulations and Supporting Guidance.

Task #4: Issue Water Quality Criteria Guidance and Interpretation Document

III. Develop WQ-Based Control Requirements

Task #5: Revise Regulation and Supporting Guidance for Wasteload Allocations/Total Maximum Daily Loads

IV. Incorporate Identified WQL Segments, Priorities, Revised/Reaffirmed Standards, TMDLs, and Effluent Limits into updated WQM Plans

Task #6: Provide Guidance for Updating CPPs and WQM Plans, and Priority Systems

V. Issue Water Quality-Based Permits and Make Water Quality-Based Construction Grant Decisions

Task #7**: Provide Guidance for Issuing Water Quality-Based Permits

Task #8: Issue Regulation and Supporting Guidance for Making Water Quality-Based Construction Grant Decisions

VI. Monitor Municipal and Industrial Sources for Compliance***; Perform Ambient Monitoring to Document Protection of Designated Uses

Task #9: Provide Guidance on Water Quality Monitoring and Local Cooperative Monitoring Programs

Task #10: Issue Revised Water Quality Management Regulation and Supportive Guidance on the Overall Margin of Safety

Task #11: Provide Data Management Support

*Task #1 is Project Implementation and Management
**Task #7 is not covered under the Office of Water Operating Guidance and Accounting System
***Separate Priority Project Workplan (OWEP)

IX. Resource Requirements

Tables 3 and 4 show estimated EPA Headquarters resource requirements to complete the necessary policy and guidance documents for Regional Office and State implementation of the water quality-based standards-to-permits project. As stated above, the several participating program offices already have completed or have planned products responsive to each of the project objectives. Consequently, most of the estimated resource requirements were obtained directly or by inference from the 1984 Office of Water Budget/Program Plans submitted to OPRM on July 7, 1982. ORD requirements are not included but will be added when they become available. ORD activities will be discussed in the report entitled "Office of Research and Development Support to the Office of Water for Water Quality Based Controls."

Table 3 shows estimated resource requirements for each project task. Requirements for FY 1983 are shown, as are projected requirements for FY 1984. Total project requirements, excluding ORD, are estimated at about 45 FTE plus 1 million for contract support. The largest requirements are related to regulations and guidance for water quality standards (Tasks 3 and 4) and TMDL/WLA guidance (Task 5). Again, it is important to understand that these are Headquarters Office of Water requirements only.

Table 4 shows the estimated resource requirements for each of the participating offices, excluding ORD. The largest requirements are for MDSD (11.43 FTE and 0.787 million) and CSD (27.44 FTE).

20-955 O—84——6

Table 3
Resource Requirements for the Water Quality
Based Standards-to-Permits Project

Task	Description	*EPA Headquarters Requirements (FTE/Contracts**) FY 83	FY 84
1	Project Implementation and Management	.82/15	.22/0
2	Provide Guidance for Identifying and Prioritizing WQL Segments.	.23/25	.02/5
3	Issue Revised WQS Regulations and Supporting Guidance	14.45/0	0/0
4	Issue Water Quality Criteria Guidance and Interpretation Document	8.78/0	4.21/0
5	Revise Regulation and Supporting Guidance for WLA/TMDL	3.40/265	.39/100
6	Provide Guidance for Updating CPPs, WQM Plans, and Priority Systems	.40/0	0/0
7	Provide Guidance for Issuing Water Quality-Based Permits	.52/115	.21/10
8	Issue Regulation and Supporting Guidance for Making Water Quality-Based Construction Grant Decisions	1.75/0	1.48/100
9	Provide Guidance on Water Quality Monitoring and Local Cooperative Monitoring Programs	1.60/120	.85/50
10	Issue Revised WQM Regulation and Supporting Guidance on the Overall Margin of Safety	.67/40	.03/20
11	Provide Data Management Support	2.85/97	1.67/125
	TOTALS	35.47/677	9.08/410

* Excludes ORD requirements (to be supplied)
** $1000's

Table 4
Resource Requirements for
Participating Offices*

Office/Division	Resource Requirements (FTE/Contract**) FY 83	FY 84
OWRS		
- MDSD	8.89/527	2.54/260
- CSD	23.23/0	4.21/0
OWPO		
- FRD	2.26/20	2.33/150
- WPD	.88/15	0/0
OWEP		
- PD	.21/115	0/0
TOTALS	35.47/677	9.08/410

* ORD requirements (to be supplied)
** $1000's

X. Schedule for Completion of Headquarters Policy and Guidance Documents

Table 5 shows actual or planned completion dates for policy and guidance documents for implementation of the standards-to-permits project. Completion dates for most individual products are not shown on Table 5 but can be found in Attachment A. For clarity, Table 5 shows only the completion dates for major regulatory changes, initial or primary policy and guidance documents, and specialized or supporting guidance documents.

It is evident from Table 5 that all of the regulatory, policy, and primary guidance documents will be completed by June, 1983. Table 5 also shows that all of the specialized and supporting guidance will be completed by December, 1985.

From this information it is clear that EPA can plan on at least partial implementation (i.e., implementation of key project elements based on initial EPA policy and guidance) of the standards-to-permits project during FY 1984 and full implementation during FY 1985. Two things are needed, however, for this to happen. First, some of the completion dates in Table 5 assume that key scientific/technical work now underway will allow completion of detailed procedural guidance on many of the more complex subject areas. Second, completion schedules for at least the major regulatory, policy, and guidance documents need to be monitored and managed carefully to avoid costly "slippage" and confusion in project implementation. This work is included under Task #1, Project Implementation and Management.

Finally, many of the guidance documents will experience an iterative process of improvement through issuance, implementation, and revision/reissuance based on the latest scientific/technical and source information plus implementation experience. Thus, it should be anticipated that the need for updated and revised program/technical guidance will continue for a number of years.

Table 5
Schedule for Completion of
Headquarters Policy & Guidance Documents

Task	Completion Date
1. Project Implementation and Management	
- Water Quality Standards Costing Project	3/83
- Priority and resoruce analysis for the standards-to-permits process	6/83
2. Provide Guidance for Identifying and Prioritizing WQL Segments	
- Guidance for problem area identification and priority setting	3/83
- Guidance (screening manual) for conventional and toxic organic pollutants	2/84
- Guidance (screening manual) for toxic metal pollutants	5/85
3. Issue Revised WQS Regulation and Supporting Guidance	
- Revised WQS regulation	5/83
- Guidance on use attainability analysis	5/83
- Guidance on benefit cost assessment	5/83
- Guidance on procedures for analyzing factors impacting use attainability	12/84
- Guidance on levels of protection	2/85
4. Issue Water Quality Criteria and Interpertation Document	
- Guidrnce on dissolved oxygen criteria	4/83
- Guidance on ammonia and chlorine criteria	7/83
- Guidance on sediment criteria	2/85
- Guidance on marine and estuarine criteria	1/85
- Guidance on site-specific criteria development	5/83

Table 5 Con't

Task	Completion Date
5. Revise Regulation and Supporting Guidance for WLAs/ TMDLS	
- WLA/TMDL portion of WQM regulation	2/83
- General guidance on standards-to-permits process	9/84
- WLAs for streams and rivers	
o BOD/DO, ammonia toxicity	1/84
o Nutrient/eutrophication	9/84
o Toxic pollutants	9/84
- WLAs for estuaries	
o BOD/DO, ammonia toxicity	9/85
o Nutrient/eutrophication	9/85
o Toxic pollutants	12/85
- WLAs for lakes and impoundments	
o BOD/DO, ammonia toxicity	9/85
o Nutrient/eutrophication	1/84
o Toxic pollutants	6/85
- Design conditions	9/85
- Innovative permits (time variable WLAs and permit(s)	9/85
- Guidance on general toxicity approach	12/83
6. Provide Guidance for Updating CPPs, WQM Plans, and Priority Systems	
- FY-83 Guidance on CPP and WQM plan updates	1/83
- Guidance on State priority systems for c.g.	12/82
- FY-84 Guidance on Section 205(j) grant eligibilities (FY-82 and 83 guidance is developed and available)	3/83

Table 5 Con't

Task	Completion Date
7. Provide Guidance for Issuing W.Q.-Based Permits	
- Interim guidance for use of biological testing procedures in NPDES permit issurance	7/83
- Guidance on selecting permit averaging periods	6/84
8. Issue Regulation and Supporting Guidance for Making Water Quality-Based Construction Grant Decisions	
- POTW advanced treatment funding policy	12/82
- POTW chlorination facility funding policy	6/83
- Advanced treatment review technical guidance	6/83
- CSO control handbook and strategy	3/83
9. Provide Guidance for Water Quality Monitoring and Local Cooperative Monitoring Programs	
- Program guidance on monitoring and WLAs	3/83
- Monitoring and WLA resource analysis	3/83
- Guidance for preparing 305(b) reports	12/82
- Guidance on Monitoring for water quality trends	9/83
- Guidance on staff quality assurance programs	12/83
- Guidance on documenting water quality improvements due to advanced treatment construction	6/83
10. Guidance on the Overall Standards-to-Permits Process: Issue Revised WQM Regulation and Supporting Guidance on the Overall Margin of Safety	
- Promulgate revised WQM regulation	2/83
- Guidance on overall margin of safety for standards-to-permits process	9/84
11. Provide Data Management Support for the Standards-to-Permits Project	
- Complex effluent toxicity information system	3/83
- Provide reach file water quality analytic capabilities	12/84
- Initiate BIOSTORET capabilities	12/84

Attachment A

TASK DESCRIPTION #1

Title: Project Implementation and Management.

Purpose: To coordinate the work being done on the project, track progress and accomplishments, and account for resource expenditures.

Method: Under the leadership of the Project Coordinator, a Water Quality Division Directors Group will act as the focal point for coordinating and implementing this project plan.. The functions of the group will be to: (a) assist in revising and updating the project plan, (b) oversee and coordinate implementation of the plan, including tracking milestones and resource utilization, (c) identify implementation problems and recommend solutions to the Office Directors, (d) identify areas requiring policy or management decisions and ensure that they are raised to the appropriate level, and (e) coordinate related activities such as research, budget development, operating guidance development, and Regional oversight.

End Product.: Project management and coordination, progress and milestone tracking, accounting of resource expenditures.

Subtasks:	Start	Finish
A. Develop, revise, and update the priority project plan (PPP); oversee and coordinate plan implementation.	7/82	Continuing
B. Prepare priority and resource analysis for standards to permits process.	10/82	10/83
C. Water Quality standards costing project	9/82	3/83
D. Develop and implement an accounting system for tracking milestones, progress and accomplishments, including Regional reporting of percentage number of segments meeting designated uses.	10/82	Continuing

Responsible Divisions: Water Quality Division Directors Group
Chairman - OWRS/MDSD
Members - OWRS/CSD, OAE
OWPO/FRD, WPD
OWEP/PD, ED

TASK DESCRIPTION #2

Title: Provide guidance for identifying and prioritizing WQL segments.

Purpose: To provide technical and policy guidance to EPA Regions and States on: how to identify waters where the established technology-based effluent limitations are not adequate to implement water quality standards, and how to develop control priorities for these waters.

Method: Water quality analysis and, in some cases, modeling are used to predict the level(s) of water quality that would be achieved by implementing technology-based effluent limitations. Control priorities are based on the severity of the problems and specific national priorities.

End Products: Program policy technical and program guidance documents.

Subtasks:	Start	1st Draft	Finish
A. Develop guidance for problem area identification and priority setting	6/82		3/83
B. Develop guidance (screening manual) for conventional and toxic organic pollutants	2/82	2/82	2/84
C. Develop guidance (screening manual) for toxic metal pollutants	2/83	8/83	5/85

Responsible Division: OWRS/MDSD

TASK DESCRIPTION #3

Title: Issue Revised Water Quality Standards Regulations and Supporting Guidance

Purpose: To issue a revised water quality standards regulation and supporting program guidance.

Method: In addition to following prescribed Agency procedures for regulation and guidance development, ASIWPCA, industrial and enviromental groups will be consulted in developing early drafts of the regulation and guidance prior to publication for formal public comment. In addition, the guidance will be field-tested and modified appropriately prior to publication. Public meetings on the Regulation will be held during the formal comment period.

End Products: Federal Regulation and supporting guidance.

Subtasks:	Start	Final
A. Issue revised water quality standards regulations	7/78	7/83
B. Develop guidance on water body survey and assessments/use attainability analysis	10/81	7/83
C. Develop guidance on benefit-cost assessment	5/82	7/83*
D. Develop guidance on procedures for analyzing physical, chemical, and biological impacting use attainability	7/82	9/84
E. Guidance on levels of protection	7/82	9/84

Responsible Divisions: Subtasks A-B OWRS/CSD
Subtasks C OWRS/OAE and CSD
Subtasks D-E OWRS/CSD

TASK DESCRIPTION #4

Title: Issue Water Quality Criteria and Interpretation Document

Purpose: To develop and issue more flexible criteria guidance whereby the user can make scientifically supportable judgments in attempting to solve specific water quality problems.

Method: To restructure the way water quality criteria guidance is developed under Section 304(a) of the Clean Water Act by providing greater emphasis on information affecting actual implementation as opposed to a narrow, limited, scientific decision. The first examples of the new criteria approaches will be in the development of criteria guidance for dissolved oxygen, ammonia and chlorine.

End Products: Revised water quality criteria.

Subtask:	Start	Finish
A. Interpretation and implementation guidance for dissolved oxygen criteria	7/80	1/83
B. Interpretation and implementation guidance for ammonia and chlorine criteria	1/81	6/83
C. Interpretation and implementation guidance on sediment criteria related to harmful pollutant concentrations		9/84
D. Guidance on marine and estuarine criteria development		9/84
E. Guidance for site-specific criteria development	1/82	5/83

Responsible Divisions: ORD and OWRS/CSD

TASK DESCRIPTION #5

Title: Revise Regulation and Supporting Guidance for Wasteload Allocations/Total Maximum Daily Loads.

Purpose: To revise the WQ Management Regulation placing greater emphasis on wasteload allocations/total maximum daily loads, and to provide technical guidance on WLA/TMDL techniques.

Method: Either pollutant-specific techniques or bioassay/biosurvey techniques can be used to establish what levels of pollution control are needed in order to meet the applicable water quality standards. These two wasteload allocation approaches are an important part of the standards to permits processes described in the revised WQ Management Regulation.

End Products: A revised WQ Management Regulation and supporting technical guidance on WLA techniques.

Subtasks:	Start	1st Draft	Fini
A. Revision of WLA/TMDL portion of WQM regulation	6/82		2/83
B. Develop WLA guidance on the pollutant-specific approach			
B1 Book I - General Guidance			
o Chapter I - Standards-to-Permits Process	12/82	4/83	9/84
o Chapter II - Program Guidance	7/82	8/82	6/83
B2 Book II - WLAs for Streams and Rivers			
o Chapter I - BOD/DO and Ammonia Toxicity Impacts	10/81	1/82	1/84
o Chapter II - Nutrient/Eutrophication Impacts	1/82	8/82	9/84
B3 Book III - WLAs for Estuaries			
o Chapter I - BOD/DO and Ammonia Toxicity Impacts	6/83	2/83	9/85
o Chapter II - Nutrient/Eutrophication Impacts	6/83	2/84	9/85
B4 Book IV - WLAs for Lakes and Impoundments			
o Chapter I - BOD/DO Impacts	6/83	2/84	9/85
o Chapter II - Nutrient/Eutrophication Impacts	10/81	1/82	1/84
B5 Book VI - Design Conditions			
o Chapter I - Stream Flow	3/82	8/82	6/84
o Chapter II - Temperature	6/82	11/82	9/84
o Chapter III - pH	9/82	12/82	12/84
o Chapter IV - Effluent Flow	6/83	12/83	9/85
o Chapter V - Rate Constants	6/83	12/83	9/85

TASK DESCRIPTION #5 (cont'd)

Subtasks:	Start	1st Draft	Finish
B6 Book IX - Innovative Permits			
o Chapter I - Time Variable WLAs and Permits	6/83	12/83	9/85
B7 Chapter III - Guidance for Modeling Toxic Pollutants in the WLA Process			
o Book II	6/82	3/83	9/84
o Book III	9/83	3/84	12/85
o Book IV	3/83	9/83	6/85
C. Develop WLA guidance on the general toxicity (bioassay/ biosurvey) approach	1/81		12/83

Responsible Divisions: Subtask A - OWPO/WPD,OWRS/MDSD
Subtask B - OWRS/MDSD
Subtask C - OWRS/MDSD, OWEP/PD

* update and revise by 12/84

TASK DESCRIPTION #6

Title: Provide Guidance for Updating CPPs, WQM Plans and Priority Systems

Purpose: To organize and present the several elements of water quality based decision making for WQL segments in a planning package with which the Clean Water Act requires NPDES and construction grants consistency. This will help ensure effective implementation of point source and nonpoint source pollution control requirements.

Method: Sections 106, 205 (g), 205(j), 208, 303, and 305 of the CWA set out the planning and management activities to be undertaken by States and local governments to establish their water quality goals and to develop programs which will meet those goals. Through its CPP, the State defines its overall planning process including the development of TMDL's, priority segments, and consistency of NPDES permits and construction grants with State WQM plans. Updated CPP's consistency between WQM plans and appropriate priority systems are important to achieve an effective water quality based approach.

Subtasks:	Start	Finish
A. Develop guidance on CPP and WQM plan updates...coordinate with revised WQM regulations to assure consistency		
A1 FY 83 guidance	10/82	1/83
A2 FY 84 guidance (updated)	6/83	9/83
B. Develop guidance on state priority systems for construction grants	5/82	12/82
C. Develop guidance on Section 205(j) grant eligibilities	9/82*	2/84**
C1 FY 82-FY 83 guidance	8/82	9/82
C2 FY 84 guidance (updated)	12/82	3/83

Responsible Divisions: Subtask A - OWPO/WPD
Subtask B - OWPO/FRD
Subtask C - OWPO/WPD

TASK DESCRIPTION #7

Title: Provide Guidance for Issuing Water Quality-Based Permits

Purpose: To issue and approve NPDES permites based on WLAs/TMDLs in water quality limited segments.

Method: Wasteload allocations are implemented by incorporating them, as enforceable conditions, into NPDES permits.

Subtasks:	Start	1st Draft	Finish
A. Develop interim guidance for use of biological testing procedures in NPDES permit issuance.	11/82	5/83	7/83
B. Develop guidance for selecting 1-, 7-, 30-day permit averaging periods.	3/82	8/82	6/84

Responsible Divisions: Subtask A - OWEP/PD, OWRS/MDSD
Subtask B - OWRS/MDSD

TASK DESCRIPTION #8

Title: Issue Regulation and Supportive Guidance for Making Water Quality-Based Construction Grant Decisions

Purpose: To make construction grant decisions (e.g., advanced POTW treatment facilities funding) consistent with revised/reaffirmed water quality standards and water quality-based ELs.

Method: EPA will publish guidance and review funding applications for advanced treatment facilities, chlorination facilities, and CSO controls based on TMDLs and ELs as presented in approved, updated WQM plans.

End Products: Policy and guidance on grant applications for POTW construction.

Subtasks:	Start	Finish
A. Develop a POTW advanced treatment funding policy	6/80	12/82
B. Develop a POTW chlorination facility funding policy (included in final C.G. regulation)	5/82	6/83
C. Develop an advanced treatment review technical guidance	6/82	6/83
D. Develop a CSO control handbook and strategy	8/80	3/83

Responsible Division: OWPO/FRD

TASK DESCRIPTION #9

Title: Provide Guidance for Water Quality Monitoring* and Local Cooperative Monitoring Programs

Purpose: To provide guidance on appropriate state, local, and EPA roles in ambient monitoring, program priorities, and to promote and facilitate development and implementation of cooperative State, and local monitoring programs.

Method: Work with Standing Work Group on Monitoring and Wasteload Allocations, consisting of representatives from States, industry and environmental groups, EPA Regions and other EPA offices to develop guidance.

End Products: Improved State, local and EPA understanding of their roles in water monitoring, also, improved coordination of EPA, State, and local monitoring resources. Development of a data base for preparing Section 305(b) reports, EPA reports to Congress, and local decision making.

Tasks:	Start	Finish
A. Develop program guidance on monitoring and WLAs	7/82	3/83
B. Prepare monitoring and WLA resource analysis	10/82	10/83
C. Develop guidance for preparing section 305(b) reports	8/82	3/83
D. Develop guidance on monitoring for water quality trends	10/82	9/83
E. Develop guidance on State quality assurance programs**	7/82	12/83
F. Develop guidance on documenting water quality improvements due to advanced treatment construction	10/82	6/83
G. Provide guidance on establishing local cooperative monitoring programs	12/82	6/83
H. Develop case studies of cooperative monitoring programs	11/82	3/83

Responsible Divisions: Subtasks A-D - OWRS/MDSD
Subtask E - OWRS/MDSD
Subtask F - OWPO/FRD, OWRS/MDSD
Subtasks G&H - OWRS/MDSD

* OWEP is developing separate priority project workplans for a compliance inspection strategy and an enforcement strategy.
** Tailors ORD quality assurance guidance to specific needs and concerns of State water quality managers.

20-955 O—84——7

TASK DESCRIPTION #10

Title: Guidance on the Overall Standards-to-Permits Process: Issue Revised WQM Regulations and Supporting Guidance on the Overall Margin of Safety.

Purpose: To simplify the WQM regulations in accordance with the Administrations policy on regulatory reform, and to provide guidance on the overall margin of safety for the water quality-based standards-to-permits process.

Method: Promulgate the revised WQM regulation and issue two margin of safety guidance documents: (a) a concept paper for State and local water quality managers and decision makers, and (b) a technical guidance manual on analyzing and quantifying the margin of safety associated with developing site-specific water quality-based controls in water quality limited segments.

Subtasks:

	Start	1st Draft	Fini
A. Promulgate the revised WQM regulation.	12/81		2/83
B. Develop guidance on the overall margin of safety for the water quality-based standards-to-permits process.			
- concept paper	10/82	12/82	8/83
- technical guidance	6/82	12/82	9/84

Responsible Divisions:

Subtask A - OWPO/WPD
Subtask B - OWRS/MDSD

TASK DESCRIPTION #11

Title: Provide Data Management Support for the Standards-to-Permits Project.

Purpose: To provide data and data management techniques which EPA and the States need to: set priorities, establish water quality-based efficient limitations, prepare State 305(b) reports, write the EPA reports to Congress, and otherwise carry out the tasks of the standards-to-permits project.

Method: Provide data management files with data management techniques and capabilities that can be used by the States and locals to link ambient and point source data to water quality-based standards-to-permits decision making. Also, provide a file for managing and analyzing effluent toxicity/bioassay data. Both files will interact with other files within STORET.

End Product: Improved data management support for local decision making and reporting.

Subtasks:	Start	Finish
A. Develop complex effluent toxicity information system (CETIS)	5/81	12/82
B. Provide reach file for water quality analytic capabilities for use by States and EPA Regions	6/80	12/84
C. Initiate BIOSTORET capabilities for States	6/80	12/84

Responsibile Divisions: Subtask A - OWEP/PD
Subtask B - OWRS/MDSD

• No. of copies: _____			
(g) Distribution $			
• Means: _____			

V. Contractor Support:

(a) Contract Planning ID No. _____

(b) Brief Work Description and Justification:

VI. Nature of policy decision(s) needed from AA, when decision(s) are needed, link to statutory/regulatory requirements:

VII. ADP Information Management (e.g., data systems support, if any required for subtask).

Date Prepared or Revised: _____

Appendix II

WATERS MEETING THE 1983 GOAL AS ESTIMATED IN

STATE SECTION 305(b) REPORTS

State	(A) Basis for Estimate	(B) Percent of (A) Currently Meeting Goal	(C) Percent of (A) Expected to Meet Goal	Primary Reason(s) for Nonattainment of Goal
Arkansas	6,239 major stream miles	Not reported	77%	Nonpoint sources
California*	27 major streams	85%	Not reported	Nonpoint sources, especially agricultural return flow
Connecticut	963 miles-major rivers	90% of total miles 70% of major rivers	Not reported	Combined sewer overflow; nonpoint pollution; industrial discharges
Georgia	20,000 total stream miles	95%	Not reported	Combined sewer overflows; urban and nonpoint runoff; WWTP discharges
Kansas	62 stream segments	97% fishable	100%	Rural runoff, natural conditions
Louisiana	113 segments	Not reported	85%	Pesticides, untreated wastes
Maine	8,600 miles	90%	Not reported	Combined sewer overflows and nonpoint pollution; also municipal discharges
Maryland	2,684 miles	90%	90%	Suspended solids, nutrients from urban runoff and agricultural runoff
Massachusetts*	1,715 assessed stream miles	45%	Nearly 60%	Nonpoint sources; industrial, municipal, combined sewer sources

Appendix II (Continued)

State	(A) Basis for Estimate	(B) Percent of (A) Currently Meeting Goal	(C) Percent of (A) Expected to Meet Goal	Primary Reason(s) for Nonattainment of Goal
New Hampshire	14,500 miles	96.5%	99%	Municipal and industrial waste, combined sewer overflows, untreated domestic discharges
New Mexico	3,500 miles	90%	95%	Point and nonpoint sources
North Dakota	47 segments	Not reported	100%	Natural conditions
Ohio	43,000 permanent stream miles in state; 3,758 miles evaluated	Over 3,048 miles are currently 1983 goals or will meet the goals by 1983. 70% of the principal streams will meet 1983 goals.		
Pennsylvania	12,962 miles	79%	82%	Abandoned mine discharge
Rhode Island	329 miles	66%	Not reported	Municipal and industrial sources, combined sewer overflows
South Carolina	88 segments	90%	Not reported	Not reported
Tennessee	13 basins	Not reported	46%	Point and nonpoint source pollution, surface mining
Texas	16,115 miles, classified	91%	97%	Sluggish flows; municipal, industrial waste
Vermont	1,126 miles assessed	84%	100% fishable 100% swimmable "where attainable"	Municipal discharges, combined sewer overflows, nonpoint sources
Virginia*	27,240 total stream miles	95%	Not reported	Kepone from industrial discharger; mine drainage; abandoned industrial plant; nonpoint sources, especially agricultural

*1980 estimates

Appendix III

USE ATTAINABILITY CASE STUDIES

COLORADO, SOUTH PLATTE RIVER

PROBLEM: Controversy as to whether current Class I warm water aquatic life use designation is reasonable or achievable

ISSUES CONSIDERED:
1. Un-ionized ammonia criteria
2. Physical obstructions and their effect on fish habitats
3. Diversions and dischargers
4. Existing and potential fish populations
5. Non-point sources

ANALYSES CONDUCTED:
1. Physical
   - flow and temperature duration analysis
   - review of factors affecting flow in the South Platte River
2. Chemical
   - review of data on un-ionized ammonia; heavy metals in water and sediment; non-point sources
3. Biological
   - review of factors affecting aquatic habitats in South Platte River
   - existing and potential fish populations
   - development of site-specific un-ionized ammonia criteria

DATA BASE: Segment 14 of the South Platte River has been under study for a number of years, and there was an extensive amount of information available. No additional field work was required.

FINDINGS:
1. A warm water fishery currently exists in Segment 14.
2. Turbidity and stream embeddedness could hinder fish spawning.
3. Insufficient data exist to establish the fact that the flow and habitat are not suitable to warrant the Class I warm water aquatic life use.

IOWA, SOUTH SKUNK RIVER

PROBLEM: River classified as "B" warmwater fishery but portion below Ames may only be marginally suitable for fish propagation.

ISSUES CONSIDERED

1. Impact of shifting sand substrate
2. Impact of agricultural runoff
3. Treatment plant effluent at Ames
4. Summer low flow

ANALYSES CONDUCTED:

1. Physical
   - -effects of temperature on system
   - -habitat suitability indices for three species
   - -low flow evaluation
2. Chemical
   - -ammonia loading into river
   - -consideration of phosphate, turbidity and COD
3. Biological
   - -survey of fish and distribution
   - -diversity indices

DATA BASE: Extensive information available on South Skunk River including fisheries data.

FINDINGS:

1. Actual uses of the River are substantially different above Ames than below, although the designated aquatic life uses are similar.
2. Physical flow and temperature limitations, especially below Ames, preclude the establishment of better natural fisheries than now exist.
3. If ammonia loading of the Ames discharge continues to increase, the passage of fish through the Skunk below Ames may be threatened.

MASSACHUSETTS, ASSABET RIVER

PROBLEM: River classified as warm water fishery, but dams and current water quality prohibit that use. An evaluation of the potential of a cold water fishery was made.

ISSUES CONSIDERED:

1. Impacts of permanent physical restrictions
2. Impacts of treated wastewater discharges
3. Natural water quality constraints

ANALYSES CONDUCTED:

1. Physical
   - -effects of dams on water quality potential of the River
   - -substrate impacts on habitats
2. Biological
   - -sampling of existing biota
   - -historical observation of biota
3. Chemical
   - -water quality restrictions to certain species
   - -potential ammonia toxicity problems

-temperature and DO evaluated to determine effects on fishery.

DATA BASE:
1. 1952 fisheries survey
2. 1969, 1974, and 1979 River quality sampling surveys, including some physical characteristics
3. 1981 Water Quality Management Plan
4. Massachusetts Division of Water Pollution Control water quality model
5. Biological observations throughout the River

FINDINGS:
1. Existing wastewater treatment plant discharges result in poor water quality throughout the River
2. Naturally high summer temperatures preclude a cold water fishery
3. Dams prevent free movement of fish in the River
4. The potential exists for a seasonal cold water fishery (through stocking)
5. The potential exists for a warm water fishery throughout the River, with limited impairment

MINNESOTA, SOUTH FORK CROW RIVER

PROBLEM: The State wanted to assess the present 2B use classification (warmwater fisheries) to determine if this use was attainable based on biological, chemical and physical characteristics of the water body.

ISSUES CONSIDERED:
1. Impacts of nonpoint source discharges
2. Impacts of point source discharges in the vicinity of Hutchinson POTW
3. Natural quality constraints

ANALYSES CONDUCTED:
1. Physical
   -effects of low flow conditions via Tennant concept
   -physical habitat assessment using Wisconsin procedures (12 physical factors used).
2. Chemical
   -evaluation of instream water quality violations
   -analysis of total inorganic nitrogen and total phosphorus
3. Biological
   -species diversity
   -distribution and composition of species
   -biological comparison to North Fork of Crow River

DATA BASE:
1. USGS flow records
2. Minnesota Pollution Control monitoring data base
3. Minnesota Department of Natural Resources (MDNR) River Survey 1978
4. MDNR River Survey 1979

5. MDNR Biological Survey, Crow River, 1974
6. MDNR Population Assessment, June 1978

FINDINGS:
1. The South Fork Crow River, like other warmwater streams in the State of Minnesota was dominated by a large rough fish population
2. Game fish and sport fish electroshocking catch percentages from the South Fork Crow River were short of the expected percentage values
3. Water level fluctuations and extended periods of low flow contributed to the impairment of the fishery potential
4. Nonpoint source runoff, and in certain areas stream bank erosion were contributing factors to normally turbid conditions
5. Point source discharges, notably below the city of Hutchinson, are resulting in instream water quality violations

NEBRASKA, SALT CREEK

PROBLEM: Classification of one of the channelized portion of Salt Creek as a limited rather than a full warm water fishery.

ISSUES CONSIDERED:
1. Fish distribution and relative abundance of fish
2. Background conditions
3. The suitability of the habitat of the limited warm water segment for a full warm water segment

ANALYSES CONDUCTED:
1. Physical habitat requirements of warm water fisheries as compared to the segments studied
2. Chemical comparisons of the limited warm water segment (channelized segment) made with the upper and lower full warm water segments
3. Biological data including fish and macroinvertebrate data were used to compare water quality, the suitability of the habitat and the integrity of the habitat and the integrity of the aquatic ecosystem in the three segments

DATA BASE:
1. Existing U.S. Geological Survey and Nebraska Department of Environmental Control monitoring data
2. Thesis from the University of Nebraska-Lincoln
3. Publications of Nebraska Game and Parks Commission

FINDINGS:
1. Water quality was degraded in the limited warm water fishery segment
2. Channelized portion of Salt Creek lacks the physical habitat conditions to attain a full warm water fishery

NORTH CAROLINA, DEEP CREEK

PROBLEM: Natural conditions and/or municipal treatment plant effluent may preclude attainment of current class C use designation.

ISSUES CONSIDERED:
1. Natural background conditions
2. Proposed level of upgrade for municipal treatment plant

ANALYSES CONDUCTED:
1. Physical
   -high summer water temperature and low flow
   -swampy area through which effluent passes before reaching River
2. Chemical
   -water chemistry analysis of receiving water at several stations
3. Biological
   -benthic macroinvertebrate surveys at several stations in receiving water

DATA BASE:
1. Self-monitoring reports of treatment plant effluent
2. Intensive 1979 water quality survey of Deep Creek
3. Intensive water quality survey of Deep Creek conducted in 1982 as part of this Assessment

FINDINGS:
1. Natural conditions preclude achievement of present water quality standard
2. Designation should be changed to swamp category which aligns aquatic use protection with a DO criteria that reflects natural conditions
3. The treatment plant effluent does not adversely effect Deep Creek.

OREGON, MALHEUR RIVER

PROBLEM: River designated as salmonid fishery but managed as a warm water fishery

ISSUES CONSIDERED:
1. Irrigation diversions
2. Quality of irrigation return flows

ANALYSES CONDUCTED:
1. Physical
   -effect of dams on water temperature and fish migration
   -sediment load and transport
2. Biological
   -resident species analysis

3. Chemical
   -suspended solids in irrigation return flow

DATA BASE:
1. Fisheries information
2. Two-year sampling program

FINDINGS:
1. High suspended solids in River and in irrigation return flow presents conditions unfavorable to salmonids
2. High water temperature, and effect of dams on River hydraulics preclude natural salmonid fishery

TEXAS, PECAN BAYOU

PROBLEM: Current use designation includes propagation of fish and wildlife, but this use is unattainable due to low DO during spawning season. Most of the flow in the river is municipal treatment plant effluent.

ISSUES CONSIDERED:
1. Water rights
2. DO, chloride, and toxic compounds

ANALYSES CONDUCTED:
1. Physical
   -flow frequency analysis
2. Chemical
   -review of data on DO, TDS, chloride and toxics
3. Biological
   -fish diversity index
   -resistance-to-change and recovery-from-stress indicators
   -DO during spawning season

DATA BASE: Extensive information was already available on Pecan Bayou; no additional field work was required.

FINDINGS: The designated use is impaired and is not being met.

VIRGINIA, BLACKWATER RIVER

PROBLEM: River designated as Class III fishery with dissolved oxygen criteria of 4 mg/l minimum. Natural background conditions may preclude use due to nature of swamp.

ISSUES CONSIDERED:
1. Nonpoint source runoff reduces dissolved oxygen levels.
2. Need for Franklin Sewage Treatment Plant (STP) to improve biochemical oxygen demand of its effluent.

ANALYSES CONDUCTED:

1. Physical
   - sediment samples for particle size analysis
2. Chemical
   - samples collected for analyses of pH, alkalinity, solids, hardness, nutrients, BOD_5, COD, phenols and heavy metals
3. Biological
   - periphyton sampling for chlorophyll a content, biomass and autotrophic index determination
   - quantitative survey of macroinvertebrates with qualitative evaluation of diversity based on knowledge of pollution tolerance for various genera.
   - species diversity index and Karr fish index.

DATA BASE:

Limited data was available for the Blackwater River thus additional field work was conducted.

FINDINGS:

The State has not reached conclusions at this point and will sample quarterly for one year. Preliminary findings are:

1. The aquatic communities are generally healthy with fair to good abundance and distribution
2. D.O. high during reproductive periods for many of the fish species found in the River
3. System is stressed by low D.O. from May through November

APPENDIX IV

SITE-SPECIFIC CRITERIA DEVELOPMENT CASE STUDIES

CALIFORNIA, NORTH COAST REGION

PROBLEM: The timber industry uses a newly manufactured form of a 2,4-D ester in aerial spraying. The State Water Resources Control Board did not have sufficient information to calculate new water quality limits for this ester. Using the site-specific protocol, the Water Resources Control Board developed site-specific water quality criteria for the 2,4-D ester to protect aquatic life in the North Coast Region.

ISSUES CONSIDERED:
1. Effect of the receiving water on the toxicity of 2,4-D ester.
2. Sensitivity of the local organisms to the 2,4-D ester.

ANALYSES CONDUCTED: The State of California, assisted by EPA, developed a site-specific testing protocol which determined the toxicity of the 2,4-D ester.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

CONNECTICUT, NORWALK RIVER

PROBLEM: A local metal finishing industry had its discharge permit up for renewal.

---Existing limits were based upon BPT for this industry .

---Both industry and State desired that the new permit reflect the limits for zinc and lead that were needed at site this for aquatic life protection.

ISSUES CONSIDERED:
1. Effect of receiving water on the toxicity of zinc and lead in the industrial discharge.
2. Sensitivity of local organisms to zinc and lead in the discharge.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: Through a cooperative effort, EPA and Connecticut developed a plan to determine site-specific water quality criteria for zinc and lead at this site.

---State utilized EPA's published ambient water quality criteria for zinc and lead as a starting point.

---Bioassays were conducted using the types of organisms found at this site with actual water from the Norwalk River to account for local environmental effects upon the toxicity of zinc and lead.

---Surveys were conducted to assess the health of the aquatic communities above, at, and below the discharge.

GEORGIA, SUWANEE CREEK

PROBLEM: A tannery was discharging ammonia and desired an ammonia limit in its permit which reflected site-specific biological and water quality conditions to protect aquatic life in Suwanee Creek.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of ammonia.
2. Sensitivity of the local organisms to ammonia.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Georgia developed a site-specific testing plan which determined the toxicity of un-ionized ammonia at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

IOWA, IOWA RIVER

PROBLEM: A POTW was discharging ammonia under differing environmental conditions and desired an ammonia limit in its permit which reflected site-specific biological and water quality conditions to protect aquatic life in the Iowa River during different seasons.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of ammonia.
2. Sensitivity of the local organisms to ammonia.
3. Seasonal variation in ammonia toxicity.
4. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Iowa developed a site-specific testing plan for the Marshalltown POTW which determined the toxicity of un-ionized ammonia under different seasonal conditions.

---Bioassays were conducted on-site utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

IOWA, MILL CREEK

PROBLEM: A metal plating plant was discharging cyanide and both the State and industry desired new limits in the permit which would reflect site-specific biological and water quality conditions to protect aquatic life in Mill Creek.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of cyanide.
2. Sensitivity of the local organisms to cyanide.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Iowa developed a site-specific testing plan which determined the toxicity of cyanide at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

LOUISIANA, SELZER CREEK

PROBLEM: A battery processing plant was discharging lead, cadmium and nickel and desired a lead, cadmium and nickel limit in its permit which reflected site-specific biological and water quality conditions to protect aquatic life in Selzer Creek.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of lead, cadmium and nickel.
2. Sensitivity of the local organisms to lead, cadmium and nickel.
3. Biological condition of the river above and below the discharge.

20-955 O—84——6

ANALYSES CONDUCTED: EPA and the State of Louisiana developed a site-specific testing plan which determined the toxicity of lead, cadmium and nickel at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

MARYLAND, PINEY RUN

PROBLEM: A POTW was discharging ammonia and chlorine and desired an ammonia and chlorine limits in its permit which reflected site-specific biological and water quality conditions to protect aquatic life in Piney Run, Maryland.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of ammonia and chlorine.
2. Sensitivity of the local organisms to ammonia and chlorine.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Maryland developed a site-specific testing plan which determined the toxicity of un-ionized ammonia and chlorine at this site.

... Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

... Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

MICHIGAN, FLINT RIVER

PROBLEM: POTW's were discharging copper and cadmium and limits were desired which would reflect site-specific biological and water quality conditions to protect aquatic life in the Flint River.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of copper and cadmium.
2. Sensitivity of the local organisms to copper and cadmium.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Michigan developed a site-specific testing protocol which determined the toxicity of copper and cadmium at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

MINNESOTA, CROW RIVER

PROBLEM: A POTW was discharging cyanide and copper and desired a cyanide and copper limit in its permit which reflected site-specific biological and water quality conditions to protect aquatic life in the Crow River.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of cyanide and copper.
2. Sensitivity of the local organisms to cyanide and copper.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Minnesota developed a site-specific testing protocol which determined the toxicity of cyanide and copper and this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

MONTANA, PRICKLEY PEAR CREEK

PROBLEM: Prickley Pear Creek was receiving metal-rich runoff from abandoned mines. The State desired to set appropriate limitations on copper and zinc to protect aquatic life in the stream.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of copper and zinc.
2. Sensitivity of the local organisms to copper and zinc.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA, assisted by the State of Montana developed a site-specific testing protocol which determined the toxicity of copper and zinc at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

NEBRASKA, SALT CREEK

PROBLEM: State desired to set appropriate limitation on lindane to protect aquatic life in the creek.
Existing national lindane criterion was not applicable to this creek because it was based on data for the brown trout. The brown trout is not indigenous to the area and it is not likely to be found in Salt Creek.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of lindane.
2. Sensitivity of the local organisms to lindane.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Nebraska developed a plan to determine site-specific water quality criteria for lindane.

---State utilized EPA's published ambient water quality criteria for lindane as a starting point.

---Bioassays were conducted using the types of organisms found at this site with actual water from Salt Creek to account for local environmental effects upon the toxicity of lindane.

---Surveys were conducted to assess the health of the aquatic communities above, at, and below several suspected dischargers.

NEW JERSEY, WALLKILL RIVER

PROBLEM: A metal plating plant was discharging nickel and chromium and desired nickel and chromium limits in its permit which would reflect site-specific biological and water quality conditions to protect aquatic life in the Wallkill River.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of nickel and chromium.
2. Sensitivity of the local organisms to nickel and chromium.

3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of New Jersey developed a site-specific testing plan which determined the toxicity of nickel and chromium at this site.
---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.
---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

NORTH CAROLINA, MULBERRY CREEK

PROBLEM: A mirror plating plant was discharging copper and desired a copper limit in its permit which reflected the appropriate amount to protect aquatic life in Mulberry Creek.

ISSUES CONSIDERED:
1. Effect of the receiving water on the toxicity of copper.
2. Sensitivity of the local organisms to copper.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of North Carolina developed a site-specific testing plan which determined the toxicity of copper at this site.
---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.
---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

OKLAHOMA, MINGO CREEK

PROBLEM: An airplane parts manufacturer was discharging chromium and zinc and desired a chromium and zinc limit in its permit which would reflect the appropriate amount to protect aquatic life in Mingo Creek.

ISSUES CONSIDERED:
1. Effect of the receiving water on the toxicity of chromium and zinc.
2. Sensitivity of the local organisms to chromium and zinc.

3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Oklahoma developed a site-specific testing protocol which determined the toxicity of chromium and zinc at this site.
---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.
---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

OKLAHOMA, SKELETON CREEK

PROBLEM: An oil refinery and POTW were discharging chromium and zinc and new limits were desired which would reflect site-specific biological and water quality conditions to protect aquatic life in Skeleton Creek.

ISSUES CONSIDERED:
1. Effect of the receiving water on the toxicity of chromium and zinc.
2. Sensitivity of the local organisms to chromium and zinc.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Oklahoma developed a site-specific testing protocol which determined the toxicity of chromium and zinc at this site.
---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.
---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

TEXAS, LEON RIVER

PROBLEM: An industrial treatment plant for Kelly Air Force Base was discharging cadmium and chromium and limits were desired which would reflect site-specific biological and water quality conditions to protect aquatic life in the Leon River.

ISSUES CONSIDERED:
1. Effect of the receiving water on the toxicity of cadmium and chromium.
2. Sensitivity of the local organisms to cadmium and chromium.

3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: EPA and the State of Texas developed a site-specific testing protocol which determined the toxicity of cadmium and chromium at this site.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

---Surveys were conducted to determine the health of the aquatic communities above, at, and below the discharge.

WASHINGTON, SPOKANE RIVER

PROBLEM: Due to smelter activities and mine drainage, zinc has been leaching into the Spokane River impacting the salmonid populations of the river. The State of Washington wanted to develop site-specific criteria for zinc for the protection of salmonids.

ISSUES CONSIDERED:

1. Effect of the receiving water on the toxicity of zinc.
2. Sensitivity of the local organisms to zinc.
3. Biological condition of the river above and below the discharge.

ANALYSES CONDUCTED: The State of Washington, assisted by EPA, developed a site-specific testing protocol which determined the toxicity of zinc.

---Bioassays were conducted utilizing the types of organisms found at the site and actual water from the site.

APPENDIX V

WATER QUALITY MANAGEMENT AND WATER QUALITY MONITORING IN THE LARIMER-WELD REGION OF COLORADO

OVERVIEW

In the Larimer-Weld region of northeastern Colorado, water quality monitoring programs supported by local government and industry provide the factual basis for cost-effective environmental protection of the region's water resources. The program includes physical, chemical, and biological monitoring with funding by municipalities and industries in the region. The program is coordinated at the regional level through the Larimer-Weld Regional Council of Governments 208 area wide water quality management program.

The 208 program has played a significant role in the development of the monitoring program. When development of the area wide plan began in 1976, deficiencies in water quality data on the complex streams of the region were recognized as a major impediment to making environmentally sound, cost-effective pollution control decisions in the region. As a result, an intensive short-term data collection program was included in plan development, with 150 locations being sampled within the region. In addition, chemical and biological data provided by Kodak/Colorado indicated the need for, and value of water quality data for decision making. Monitoring data was instrumental in developing a technically sound, cost-effective, publicly accepted water quality management approach for the region.

Development of an on-going water quality monitoring program was considered a high priority in the area wide plan. Following plan adoption at the local and state level and approval by EPA, the Larimer-Weld Regional Council of Governments sponsored development of an implementation plan for an on-going regional water quality monitoring program. Existing monitoring programs were reviewed, deficiencies identified, and recommendations were made for specific biological, chemical and flow monitoring activities. Practically all of the recommendations have been implemented with the financial support of local government and industry.

Water quality monitoring is considered a high priority by local government and industry, as indicated by the fact that the program has been expanded in recent years when other programs have experienced budgetary constraints. Water quality monitoring data has played a key role in decisions regarding proposed water quality standards for the region, and in defining the cost-effectiveness of various wastewater treatment alternatives. The water quality monitoring program will play an even more important role in the future as growth and development occur within the region, and additional pressures are placed on the quality and quantity of water resources.

2.

MONITORING AND THE REGIONAL 208 PLAN

Larimer-Weld region was designated for area wide planning by the Environmental Protection Agency in 1975. The 6600 square mile region was experiencing high growth rates in urban centers such as Fort Collins, Loveland, and Greeley. The 208 plan was to address future wastewater treatment needs, as well as impacts of non-point sources. The Larimer-Weld Regional Council of Governments (COG) was designated as the area wide planning agency. Early in the 208 planning program, lack of adequate water quality data to define point and non-point source impacts was identified as a major impediment to developing a realistic, cost-effective water quality management plan for the region. Available water quality data was considered inadequate for planning because:

1. A complex system of stream diversions and irrigation return flows resulted in regional streams being non-contiguous on a seasonal basis. Simple application of available water quality data failed to reflect this vital fact.

2. Stream flow data was infrequently collected with chemical data.

3. Pollutants of concern, such as ammonia, had not been monitored at key locations.

4. Point and non-point source impacts could not be identified or differentiated.

Recommendations by consultants (Toups, 1976) resulted in a short-term intensive monitoring program for the region. Approximately 150 locations in the region were sampled. Some locations were sampled only once, and some several times on a seasonal basis to define impacts.

Eastman Kodak-Colorado Division (Kodak/Colorado) provided information to the 208 planning program on water quality and biota of the Cache la Poudre River, one of the major streams in the region. Kodak/Colorado initiated a multi-media monitoring program in 1969, prior to constructing a major manufacturing facility at Windsor, Colorado, on the Cache la Poudre River, to monitor the impact of its facility on the environment of the region. This exemplary program proved to be invaluable in evaluating point and non-point source impacts on the chemistry and biota of complex streams in the region.

The site-specific data provided by Kodak/Colorado and the intensive short-term regional monitoring program supported several scientifically based conclusions incorporated into the Larimer-Weld 208 plan, including a finding that

> "A coordinated water quality, quantity, and biological monitoring program will be implemented to assure the necessary margin of safety (for) existing aquatic life and (to) obtain useful information to further plan water quality control measures." (LWRCOG; 1978)

3.

PLAN IMPLEMENTATION

The Larimer-Weld 208 Plan states:

> "A water quality monitoring program is a fundamental need to insure that future investments in water pollution control are made in a wise and efficient manner." (Pitts, 1978)

Because of the obvious value of in-stream water quality data, Larimer-Weld 208 Plan implementation placed a high priority on development of a long-term water quality monitoring program to support water quality decisions in the region. In 1979, the Larimer-Weld area wide planning agency (COG) established a regional water quality monitoring advisory committee which included representatives from local municipalities and industries, Colorado State University, Colorado Department of Health, Colorado Division of Wildlife, Environmental Protection Agency, U.S. Forest Service, and U.S. Geological Survey. (Trembly, 1979)

The committee, with staff and technical support, reviewed and evaluated existing programs, established regional monitoring goals, compared existing programs to those goals, developed detailed recommendations for a regional monitoring program, determined institutional responsibilities, and developed a financial plan which placed principal reliance on local government and industry for program support. (Pitts, 1980) The implementation plan included specific recommendations regarding:

1. The location of sampling stations.
2. Constituents to be analyzed at each station.
3. Frequency of sampling.
4. Modification of pre-existing Federal and State monitoring programs to comply with regional monitoring goals.
5. Expansion of biological monitoring programs.
6. Use of site-specific bioassays to determine appropriate numeric criteria for aquatic life.
7. Collection of flow data with all chemical samples.
8. Establishment of a statewide bioassay/biosurvey committee by the State of Colorado to recommend scientifically sound procedures for biological monitoring and bioassays.

In 1981, the region's monitoring program was significantly expanded to meet regional water quality monitoring goals (Pitts, 1981) at a time when other programs were budgetarily constrained (Pusey, 1982). Practically all of the recommendations included in the regional plan for water quality monitoring needing the support of local government and industry were implemented. The City of Loveland, Hewlett-Packard, City of Fort Collins,

and Kodak/Colorado agreed to provide funding and technical support for the program. The Larimer-Weld Regional Council of Governments 208 Planning Agency agreed to provide coordination. On the Cache la Poudre River, biological surveys were expanded in the vicinity of Fort Collins. The City of Fort Collins and Kodak/Colorado initiated a cost sharing agreement for biological surveys on the Cache la Poudre River. In addition, several new water quality stations were established, including some operated by the U.S. Geological Survey (U.S.G.S.). The City staff and staff of Kodak/Colorado agreed to implement weekly monitoring of several constituents of concern, including monitoring of flow in the river. The City of Loveland and Hewlett-Packard initiated weekly monitoring programs for selected constituents on the Big Thompson River. Several new water quality stations were established on the Big Thompson River through agreement with U.S.G.S., and biological surveys were initiated on a routine basis.

The City of Loveland, with partial funding from Hewlett-Packard, and the City of Fort Collins entered into inter-governmental agreements with Larimer-Weld Regional Council of Governments to provide funding for a coordinated U.S.G.S. sampling program in the region. The Council of Governments subsequently entered into an agreement with the U.S. Geological Survey for cooperative flow and water quality stations in the region. In addition to the long-term monitoring program, the City of Loveland and Hewlett-Packard sponsored bioassays to assist in establishing numeric criteria for silver and copper on the Big Thompson River.

WATER QUALITY STANDARDS

In July, 1980, the Colorado Water Quality Control Commission conducted hearings on water quality standards for the Larimer-Weld region with the objective of assigning specific designated use classifications and numeric criteria. Municipalities and industries in the region supported recommendations for use classifications recommended in the regional 208 plan. In addition, site specific bioassays were conducted to support recommendations for specific numeric criteria (Morrison, 1980). Bioassay results and physical, chemical, and biological data (Morrison, 1978, 1979) provided a conclusive set of evidence supporting appropriate designated uses and numeric criteria for key constituents. The development of the technical data supporting water quality standard recommendations was jointly sponsored by the cities of Fort Collins, Greeley and Loveland, Town of Windsor, Kodak/Colorado, and the Cache la Poudre Water Users Association (Pitts, 1980). Each entity also provided recommendations and supporting site-specific data to the Commission on specific concerns. (Houck, 1980; Reitz, 1980). In 1981, the Commission adopted water quality standards for the Larimer-Weld region which were substantially in agreement with the recommendations of the area wide planning agency and local government and industry. (Commission, 1981) These standards were approved by EPA in 1982. (Durham, 1982) Water quality monitoring data and additional site-specific data were decisive in developing recommended classifications and numeric criteria, and subsequent adoption and approval of appropriate water quality standards.

5.

MONITORING PROGRAM COSTS

The 1981 estimated cost to each participant, including U.S.G.S. cooperative support, is shown in Table 1. The Cache la Poudre River, approximately 48 miles of river are being monitored and on the Big Thompson River approximately 10 miles of river are included in the monitoring program. The data on both rivers is augmented by other U.S.G.S. stations sponsored by other co-operators. The costs include in-house costs for direct program support for water quality sampling and laboratory analyses. The distribution of costs for various program elements is provided in Table 2.

Table 1

Water Quality Monitoring Program Costs for 1981

Cache la Poudre River	
Municipal/Industrial	$145,300
U.S.G.S. (Poudre River Cooperative Program)	$ 22,000
Subtotal - Cache la Poudre River	$167,800
Big Thompson River	
Municipal/Industrial	$ 48,300
U.S.G.S. (Big Thompson Cooperative Program)	$ 10,700
Subtotal - Big Thompson River	$ 59,000
TOTAL	$226,800

Table 2

Cost Distribution for Monitoring Program Elements

Item	1981 Cost	% of Total
U.S.G.S. Cooperative Monitoring Program*	$ 65,400	29%
Biosurveys (Fish & Benthic)	$ 46,400	20%
Bioassays	$ 15,000	7%
Water Quality Sampling and Analysis	$100,000	44%
	$226,800	100%

* Includes 50% Municipal share

These costs may seem high for the number of river miles monitored, however, the hydrologic complexities of the Cache la Poudre River and Big Thompson River warrant more extensive monitoring than would be the case in most streams. Biological monitoring, a fairly significant cost item, is considered essential to the program. It provides the "margin of safety" specified in the 208 plan and the Federal Water Pollution Control Act. The biological monitoring program includes both fish and benthic surveys, conducted up to eight times per year at several locations on the Cache la Poudre River, and twice a year on the Big Thompson River.

The municipalities and industries expanded the program considerably in 1981 and this expanded program is being maintained by those municipalities and industries on the Cache la Poudre River.

FUTURE OF THE REGIONAL MONITORING PROGRAM

The commitment to water quality monitoring by local government and industry is significant and long-term. The site specific water quality data has proven its value in the planning and standards setting elements of the water quality management process; it is expected to be even more valuable as a tool for setting NPDES permit limits. Near term plans for the program include implementing an automated data processing system for more efficient storage, access, and analysis of water quality data, and continued annual program effectiveness reviews. Water quality standards reviews are anticipated in the mid-1980's, and the water quality data will play an increasingly important role in that process.

TESTIMONY OF FREDERIC A. EIDSNESS, JR., ASSISTANT ADMINISTRATOR FOR WATER, U.S. ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY STEVEN SCHATZOW, DIRECTOR, OFFICE OF WATER REGULATION AND STANDARDS; AL RUBIN, CHIEF, WATER QUALITY CRITERIA SECTION, CRITERIA BRANCH; DAVID SABOCK, CHIEF, CRITERIA BRANCH; OFFICE OF WATER REGULATIONS AND STANDARDS; EPHRAIM KING, ATTORNEY ADVISER, OFFICE OF LEGISLATION; AND TUDOR DAVIES, DIRECTOR OF POLICY, OFFICER OF WATER

Mr. EIDSNESS. Thank you and good morning, Mr. Chairman and members of the subcommittee. I would like to introduce members of my staff present today who may or may not assist me, depending upon the depth of your questions and the scope of your questions. To my right is Mr. Steven Schatzow. Mr. Schatzow is the Director of EPA's Office of Water Regulations and Standards.

Immediately to my right and behind me is Mr. David Sabock. He is the branch chief for water quality standards and was involved in all 11 public meetings we held around the country on this important subject.

To his right is Dr. Al Rubin, who is a scientist of some renown in our agency and who developed some of the specific criteria and protocols that we will discuss later in our testimony.

On my left I would like to introduce Dr. Tudor Davies. He has just joined my staff as the head of the water policy staff. He was formerly director of the Narragansett Laboratory, under the research and development program, where he has had extensive experience in marine pollution. Also, Tudor was the father of the Chesapeake Bay program, so to speak, within the Environmental Protection Agency, and I am glad to have Tudor on my staff. He is going to be a great asset to us.

I would also like to introduce Ephraim King from the Office of Legislation. He was very instrumental in developing the long version of the testimony that the members have this morning.

I do apologize for the lateness of the submittal of our testimony. It was largely because, on returning from London, where I was attending the London Dumping Convention. I got involved in rewriting the final draft which we are going to discuss this morning.

Mr. ROE. If the gentleman would yield for a moment, it is the intent of the committee and we consider this to be an extraordinarily important issue, as I am sure you are aware, and we are asking you for your initial overview today, and then we will be calling on general public witnesses and other organizations and we will no doubt be calling you back when we get to that point.

Mr. EIDSNESS. I look forward to that opportunity, Congressman. I am going to be reading this morning from a lighted version of my short testimony. I hope all of you have copies of it. Some of you, I understand, might like to track it, so if you read the highlighted version that is what I am going to read. I hope you will have time to study the remaining part, but I am abbreviating this so we can get to your questions and answers.

Mr. ROE. The gentleman's statement will appear in full in the record.

Mr. EIDSNESS. Thank you.

Also, I should ask that, as you know, Dr. Hernandez is ill today and I hope I can do as good a job as he would have done had he been here. I would like to introduce for the record a brief statement that he would have presented to you this morning had he been here.

Mr. ROE. No objection, it is so ordered.

[The prepared statement of Dr. Hernandez follows:]

PREPARED STATEMENT OF DR. JOHN HERNANDEZ, DEPUTY ADMINISTRATOR, U.S. ENVIRONMENTAL PROTECTION AGENCY

Good morning, Mr. Chairman and Members of the Subcommittee. I am John Hernandez, Deputy Administrator of the United States Environmental Protection Agency. With me today is Eric Eidsness, EPA's Assistant Administrator for Water. As always, I am glad to be here with you, particularly since the Subcommittee has played such a key role in formulating the basis of our national clean water policy and in working with various administrations toward mutually shared environmental goals.

To those of you with whom I have had the great privilege of working during the 97th Congress, I would like to say that I look forward to continuing our relationship and to providing any and all assistance in your review of the proposed modifications to regulations that guide States in establishing their water quality standards and in your review of the Clean Water Act. To those of you who are new on the Subcommittee, let me say that I welcome the opportunity to work with you, to understand and respond to your concerns, and to help in whatever way possible in explaining the Act and EPA's efforts to implement it.

Under your able leadership, Mr. Chairman, the reforms of the Construction Grants program were enacted into law on December 29, 1981. Through the past summer and fall, Congress has held detailed hearings on the Administration's recommendations for reauthorization of the remainder of the Clean Water Act.

This Committee is now considering those recommendations. During this same period, EPA published revised regulations implementing the Construction Grants Amendments of 1981 and the proposed revisions to the Water Quality Management regulations that will be discussed today. We have also made major strides in the issuance of technology-based guidelines in accordance with the schedule we provided this Committee last year. These are complex rules to ensure that all American industry will provide the best treatment for their waste water that is technologically available for the removal of toxic materials. With the development and issuance of these industry-by-industry technology-based guidelines well underway, we proposed in October 1982 a series of administrative and regulatory modifications to our water quality standards program.

Today we are here at your request to discuss EPA's proposals in the water quality area. Let me say at the outset that we believe that technology-based standards must form the foundation of an effective pollution control program. We see the essential role of the water quality standards approach as building on that foundation to bring us closer to the ultimate goals of the Clean Water Act. Let me further be clear, as I am sure Eric Eidsness will stress in his discussion, that our proposals are designed to strengthen the Act, not to undercut it. Water quality standards should be periodically reviewed and revised as our science and data base improve in order to give the States another tool in their efforts to improve their surface waters and to manage their water resources most effectively. The 1981 amendments to the Clean Water Act directs the States to go through such a review

20-955 O—84——9

process by January 1, 1985. EPA has proposed a revised guidance for this process.

In this regard, Mr. Chairman, we are aware of your concerns that our proposals may allow States too much leeway so that clear progress to the goals of fishable/swimmable waters may not be made and that the proposal may not follow the original intent of the 1972 Act. Mr. Chairman, that was neither the rationale nor, in my opinion, will it be the effect of our proposed changes.

I have gone on record, the Administrator has gone on record, and the Administration has gone on record as being committed to the Clean Water Act's fundamental objective of restoring and maintaining the chemical, physical, and biological integrity of the Nation's waters. We strongly believe that the Act's dual approach of first requiring that industry and municipals provide, as a minimum, technology-based treatment and second that site-specific water quality based standards are met in all of America's surface waters. This is a sound and effective strategy and is the basis of the Clean Water Act. It has resulted in substantial progress, and we are working to continue that progress.

Our purpose this morning is to explain to the Subcommittee the intent and objectives underlying our proposals. Eric Eidsness will do this in more detail. When we are finished I hope you will agree that our intent goes in the right direction. We believe that approach which we are trying to improve is the approach specifically laid out in the Clean Water Act. You should know that many State water pollution control agencies

have long sought changes in EPA's water quality regulations to allow for flexibility needed to address the very real and very different situations and water uses that are found in our 50 States and Puerto Rico - differences that range from clear perennial alpine streams to flood-fed intermittent flows over and across deserts.

What I am most concerned about, Mr. Chairman, is that we avoid misunderstanding as to what it is we are trying to accomplish. And what I most hope for, Mr. Chairman, is that we can achieve a dialogue, based on an understanding of commonly accepted goals, as to the most effective means of achieving those goals.

Let me be frank, it is entirely possible that we may not have been as clear as we should have been as to what we are trying to accomplish. If we haven't been clear, then there is no question that the burden is on us to work with you and all other interested parties in developing a mutually acceptable approach that we all can agree strengthens and improves the operation of this vital program.

With your permission Mr. Chairman, I would like to turn to Mr. Eidsness for a detailed explanation of our recent initiatives in this area. I know that Eric agrees with me as to the vital importance of the Clean Water Act's dual approach to water pollution control and the need to ensure that both parts of this strategy are operating as effectively as possible.

Again, I appreciate the opportunity to be here and to outline our position.

Mr. EIDSNESS. In response to your request, I will discuss this morning EPA's water quality management program and the regulatory and administrative modifications that we have proposed to improve it. With your permission also, Mr. Chairman, I would like to submit a longer statement for the record which will expand on my comments in more detail.

Mr. ROE. No objections, it is so ordered.

Mr. EIDSNESS. At the outset, let me emphasize that our proposals to improve the water quality standards program in no way affect our commitment to technology-based controls under the Clean Water Act. The strategy underlying the Clean Water Act includes the two approaches of both technology and water quality based controls as integral components of the same effort to reduce water pollution.

I believe that the combination of our water quality proposals, together with our substantial progress in issuing technology-based guidelines, clearly demonstrates the agency's continuing determination to implement this strategy.

I. BACKGROUND

The Federal Water Pollution Control Act Amendments of 1972 contemplated a strong Federal-State partnership in the renewed effort to control water pollution. EPA was given the initial job of establishing national technology-based effluent limitations and a national permit program by which they could be enforced.

At the same time, however, States were charged with the primary responsibility for preventing, reducing, and eliminating pollution through the development of water quality management programs including the establishment of water quality standards.

The act's technology-based limitations prescribed minimum standards of performance for municipal and industrial discharges without regard to the quality of receiving waters. By contrast, water quality standards identify intended uses of particular water bodies and, on the basis of national guidance developed by EPA, set forth the conditions that must exist in the receiving body of water to sustain those uses. These conditions are referred to as water quality criteria.

Designated uses, together with supporting criteria, constitute water quality standards. Generally, technology-based standards set minimum control requirements which all point source discharges are required to meet. Where those limitations are not adequate to achieve a particular State designated use, then State water quality standards come into play and mandate the additional controls necessary to meet the designated use.

Water quality standards serve three important functions under the Clean Water Act. First, they, in effect, establish a goal for a particular stream or water body by the assignment of a designated use and a level of desired water quality.

Second, water quality standards serve as a basis upon which States make management decisions to control nonpoint sources of pollution to the extent feasible. Finally, and most importantly, water quality standards serve as an enforceable tool to supplement

technology-based standards and further reduce pollutant loadings from point source discharges.

Following the adoption of standards the States embark upon a planning process involving the development of monitoring data, the allocation of wasteloads to point and nonpoint sources of pollution discharging into specified water bodies, plans for the prevention and control of such pollutants and, in the case of point source discharges, specific permit limitations based upon the calculation of such wasteloads.

There is a considerable amount of predictability and interpretation involved in relating a pollutant discharge into a particular water body to the protection of a designated beneficial use based upon adopted instream numeric criteria. Section 303(d)(1)(C) provides specific instructions on how a State is to take into account any lack of knowledge concerning the relationship between effluent limitations and water quality.

Specifically, section 303(d)(1)(C) states such (waste) load shall be established at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.

The margin of safety provision of the act has been incorporated into other aspects of the standards adoption process and the translation of standards into enforceable permit limitations. The concept of providing for an adequate margin of safety is sound and is one to which EPA subscribes.

Currently, all 57 States and jurisdictions have approved water quality standards. All States have developed plans, and are currently updating those plans, which prescribe point and nonpoint source control requirements that are needed to meet water quality standards. States and EPA have written NPDES permits on the basis of State water quality standards, as well as the applicable technology-based requirements.

Examples of the results of such permits are advanced treatment [AT] processes for municipalities. This is a subject that I will address later in my testimony.

The pollutants that have been most commonly regulated on the basis of water quality standards are biochemical oxygen demand [BOD], dissolved oxygen, fecal coliform, suspended solids and temperature. Toxic pollutants, such as heavy metals, have not traditionally been a focus for regulation under water quality standards.

While we have considerable experience in regulating the conventional pollutants, additional effort will be needed to develop and apply these techniques to toxic substances, where they are not otherwise regulated on the basis of technology standards.

As I mentioned earlier, States have the primary responsibility for developing these water quality standards. However, under the act, EPA has final review and approval authority over all States adopted standards.

II. PROBLEMS

The adoption and implementation of water quality standards under the 1972 act has not been without difficulty and controversy.

I would like to briefly describe some of the problems the regulated community, States, and EPA have encountered under water quality standards. Some of these difficulties were the result of EPA policies and/or attitudes toward States, and others were the results of inadequate analytical and technical procedures, criteria, and guidance.

A. SOME WATER BODIES MAY HAVE BEEN INAPPROPRIATELY CLASSIFIED

Immediately after the passage of the 1972 Clean Water Act amendments, most States adopted fishable and swimmable use classifications for their rivers, lakes, and streams. This was sometimes done without adequate analysis concerning what constituted a fishable use given the chemical, physical, and biological characteristics of a particular water body. Experience has shown that, in some cases, a particular use, such as a trout fishery, cannot be attained because of hydrologic conditions or physical modifications of the stream. In some instances the occurrence of pollution prevents the use from being attained.

B. EPA'S PRESUMPTIVE APPLICABILITY POLICY

Under section 304(a) of the Clean Water Act, the EPA is to recommend national water quality criteria for incorporation, as appropriate, into State water quality standards. In 1976 EPA published the so-called Red Book containing recommended water quality criteria for a large number of pollutant parameters including dissolved oxygen, heavy metals, organic pollutants, and others.

These criteria were considered recommended allowable concentrations in the ambient stream which were adequate to protect sensitive aquatic organisms as determined under laboratory conditions. Between 1978 and 1980 EPA implemented a policy of "presumptive applicability." This policy, in effect, required States to adopt EPA laboratory derived national criteria unless the State could adequately justify another number. However, EPA provided no guidance on what would constitute adequate justification.

This was a controversial policy. Some States and members of the regulated community viewed this policy as (1) a preemption of States' rights and responsibilities, under section 303 of the Clean Water Act, to establish water quality standards, and (2) arbitrary, as there was no authority for EPA to impose this requirement on States.

In practical terms this policy was contrary to good science. EPA's laboratory-derived national criteria did not account for local factors, such as variations in water chemistry, pH or biological communities. In many Western streams the section 304(a) criterion for copper is inappropriate because there is a high suspended particulate content in the stream which renders the copper biologically inactive.

The data base from which the national copper criterion was developed used water free from suspended solids. If the national criterion is used in the water quality standard for a stream with a high particulate content, the permit limitation for copper on that stream may be unnecessarily stringent.

Because of the controversy surrounding this issue, EPA published a Federal Register notice on November 28, 1980, rescinding its policy of presumptive applicability. However, some States had by that time already adopted a number of EPA's recommended criteria. The need remains to provide specific procedures for States to use that are scientifically valid, and that allow for site specific modifications.

C. LACK OF PRIORITY

EPA's past policies concerning water quality standards revisions and water quality management planning, under section 208 of the Clean Water Act, lacked focus and any sense of priority. For example, EPA's regulations and guidance concerning water quality management planning under section 208 placed an unreasonable burden on States and areawide planning agencies to develop plans to control point and nonpoint sources of pollution.

While a number of noteworthy achievements resulted from such planning efforts, areawide plans, in order to meet the national requirements, sometimes addressed issues which were really not significant or important with respect to local water quality.

D. MANDATED 3-YEAR REVIEW AND REVISION OF WATER QUALITY STANDARDS

EPA's existing water quality standards regulations have been interpreted to require that States review and revise, if appropriate, all water quality standards on a 3-year cycle. This is a totally unreasonable burden to impose upon States.

Most States would prefer to review water quality standards on only those streams where there is considerable public interest, insuring that such standards reflect the goals and policies of the respective States, or where major regulatory actions are being contemplated.

E. ADEQUACY OF DATA AND ASSUMPTIONS IN ADOPTING AND APPLYING STANDARDS

As stated previously, there is a considerable amount of predictability involved in developing and applying water quality standards as a regulatory tool. Acquisition of data is an evolutionary process. EPA's past policies concerning water quality standards and planning have focused on the development and use of chemical quality data.

Experience has shown that physical and biological information is also essential to properly characterize the use and control strategies which will attain or enhance the designated use. In recent years, States and EPA have been developing such data and are now beginning to incorporate it into the decision process.

F. ANALYTICAL PROCEDURES AND ASSUMPTIONS

The fiscal year 1979 Appropriations Committee report for the construction grants program, which is a program we fund, directed the Administrator to personally determine that treatment greater than secondary treatment—otherwise known as advanced treat-

ment—required by the State under approved water quality standards will definitely result in significant water quality and public health improvement.

Since 1979 the Administrator has reviewed 80 advanced treatment projects: Changes were made in 52 percent of the projects, amounting to a capital cost saving of about $0.8 billion. As a result of these reviews, and experience gained by States and the regulated community, EPA has identified a number of technical and analytical areas where guidance is needed. I will share briefly with you some of the problems we have encountered in conducting these reviews.

As mentioned earlier, some of the numeric criteria adopted in States' standards, upon which advanced treatment requirements were based, were inappropriate in terms of the chemical, physical, and biological characteristics of the stream. While in some cases there was concern about the appropriateness of the numeric criteria, in other cases the criteria were not properly applied.

A long-term chronic number may have been used with short-term low flows, when an acute value should have been used. Quite often, extremely conservative wasteload allocation models were used or the models were not properly verified and applied to the receiving waters.

The point of these examples is that many of the assumptions were made somewhat inconsistently and without benefit of peer review and policy determination by the appropriate State rulemaking body.

It is within a State's prerogative, subject to EPA approval, to make whatever policy decision it feels is appropriate in adopting and applying water quality standards as a regulatory and management tool. However, EPA's congressional mandate makes it incumbent upon the administrator to assure that there will be definite water quality and public health improvements resulting from the expenditure of public funds through the construction grants program.

Assuming that States and local governments are equally concerned with the benefits derived from such expenditures, additional analytical procedures and guidance are needed so that States can select, from among the technical options, those which meet their policy needs.

G. WIDESPREAD ECONOMIC IMPACT

Under EPA's current regulation, the States may establish less restrictive uses than those contained in existing water quality standards, only where States can demonstrate, among other things, the following:

Mr. ROE. Will the gentleman hold for a moment?

Mr. EIDSNESS. Of course.

Mr. ROE. On page 8, as we were tracking you along to the top of page 9, just for clarification, I am going back now to the bottom of page 8. "The fiscal year 1979 Appropriations Committee report for the construction grants program directed the administrator to personally determine that treatment greater than secondary treatment—otherwise known as advanced treatment"—the third step is

what I am talking to—"required the State under approved water quality standards will definitely result in significant water quality and public health improvement."

You brought in some figures. What were those figures you brought in?

Mr. EIDSNESS. These figures are in the long version of the testimony, Mr. Chairman. The total capital cost of these 80 projects for advanced treatment itself was approximately $1.67 billion.

Mr. ROE. Right.

Mr. EIDSNESS. The result of these reviews conducted by EPA, under the Appropriations Committee language, was a cost savings of approximately half of that $1.67 billion, or roughly $0.82 billion. Because those dollars are not showing any significant water quality——

Mr. ROE. We will discuss that later. The figures are $0.82 billion?

Mr. EIDSNESS. Yes, sir. Those figures are discussed in detail in my long testimony.

Mr. ROE. The gentleman will proceed.

Mr. EIDSNESS. Thank you.

Under EPA's current regulation, the States may establish less restrictive uses than those contained in existing water quality standards, only where States can demonstrate, among other things, the following:

The adverse economic and social impacts resulting specifically from imposition of controls and reflected in primary and secondary unemployment impacts, plant closures, changes in Government fiscal base and other area economic indicators are substantial and widespread in comparison to other economic factors affecting the area's economy, to national economic conditions and fluctuations, and can be expected to persist for periods longer than provided for by adjustment payments such as unemployment compensation; and they are detectable in an area appropriate for measurement at least as large as a county or SMSA and, if appropriate, any larger economic area such as defined by the Bureau of Economic Analysis, U.S. Department of Commerce. In making a determination of substantial impact the positive economic and social impact of enhanced water quality must be evaluated.

Two problems resulted from this particular policy. First, at the time States adopted their standards, information on the cost of pollution control resulting from standards was not available. Such information, as I have explained earlier in my testimony, is developed in the context of water quality management planning under sections 303 and 208 of the Clean Water Act.

Second, the test appeared to be difficult, if not impossible, to meet and in practice become an insurmountable one. Our experience in conducting advanced treatment reviews, as you just mentioned, coupled with an affordability analysis EPA and grantees conduct as part of the construction grant program, suggest that this test is unreasonable and unworkable. We are looking for an alternative, preferably one that is used elsewhere in the act.

III. APPROACH

The technical issues I have been discussing reflect a broader problem that must be recognized in reviewing the water quality standards program. The fact is that with the high priority and urgency attached to the development of technology-based standards, there has been less emphasis at the Federal level on the water quality approach. This has resulted in both inadequate and often inflexible direction from Washington and also uncertainty among States as to their specific responsibilities and prerogatives.

In the past, policies, regulations, guidance, and testing were developed by agency offices independent of one another. To deal with this we have had to integrate our expertise and resources into a systematic drive to develop solutions to both the technical and more general problems that I have discussed.

At my direction, a combination of policy initiatives, regulatory reforms, and guidance materials have been identified and a schedule for their development laid out. We are well on our way to completing that schedule. For your reference and information, a copy of the schedule is attached to my longer statement for the record.

On October 29, 1982, EPA proposed revisions to the water quality standards regulations. We also have proposed reforms to the water quality management regulations which describe the procedures and requirements that States and areawide planning agencies must meet to implement standards under sections 303 (d) and (e), and 205(j) of the Clean Water Act. Draft guidance describing technical approaches that States might follow in adopting and implementing water quality standards has also been made available to the public.

I would like to emphasize, Mr. Chairman, that the purpose of the proposed changes to the water quality standards and water quality management regulations, and draft technical guidance, was not to unilaterally declare water quality policy by fiat. It was to inform all interested parties as to the issues that are confronting us and to request the reviews and experiences of others in assisting us in perfecting the design of a water quality standards-based approach.

These proposals were developed in concert with the States. The States played an active role from the beginning in revising the regulation on water quality standards. Starting in October 1980, a subcommittee of the Association of State and Interstate Water Pollution Control Administrators [ASIWPCA] revised five drafts of the regulation and met with EPA on numerous occasions.

In addition to the 10 States and interstate agencies serving on the subcommittee, all States received at least two drafts of the proposed revisions before they were published. Eighteen States assisted in the development and testing of the guidance supporting the regulation. Environmental, business and industry groups were also consulted and received drafts of the proposals.

Following the proposed rulemaking, we held 11 public meetings nationwide specifically to solicit reactions and comments. Nine hundred and twenty people attended those meetings. We have received 1,400 letters on the proposal, and we are carefully evaluating all recommendations. We have succeeded in stimulating the debate and interest that we wanted.

Questions have been raised on the feasibility of the water quality-based approach in general and specifically on the approaches outlined in the proposed revisions to the water quality standards regulation. I wish to address these questions directly as a means of clarifying our initiatives for this subcommittee.

In summary, the questions are:

(1) Will there be widespread revisions to State water quality standards under EPA's proposed program?

(2) Given the apparent technical complexity of the water quality standards-based controls, how are the water quality standards review requirements of the 1981 Clean Water Act Amendments and section 303(c) of the acting going to be met?

(3) Will the technical tools and guidance themselves be available in a timely manner to accomplish the standards revision task?

(4) What are the implications of a focus on protection of uses particularly in relationship to high-quality waters?

(5) What is the EPA trying to achieve in incorporating a cost-benefit consideration in the adoption of standards?

One, will there be widespread revisions to State water quality standards under EPA's proposed program?

We do not believe that there will be widespread revisions to State water quality standards, principally for three reasons. As indicated by State submissions for the 1982 national water quality inventory report to Congress—see appendix I—technology-based controls have improved the quality of many of the Nation's rivers and streams.

Overall trends toward continuing improvement in water quality are cited by 21 of the 33 States submitting trend information in their 1982 water quality reports. Twenty States also provided estimates of their progress toward the Clean Water Act's 1983 goal of fishable/swimmable water quality.

These 1982 estimates of waters currently meeting the fishable/swimmable goal range from a low of 66 percent of Rhode Island's 329 miles of streams to a high of 97 percent of New Hampshire's 14,500 stream-miles. While it should be noted that no precise national conclusions about the percent of waters meeting the goal can be drawn because of varying methods of assessing goal attainment, these estimates do indicate that a majority of the Nation's waters now meet the 1983 goal, and hence that a relatively small proportion will require consideration for additional water quality-based controls.

As discussed earlier, technical problems encountered in translating a State's water quality standards into an enforceable permit limitation has resulted in expensive, and sometimes controversial, water pollution control requirements on municipalities for which there were no direct or discernable public health or water quality improvements.

These are conclusions we reached as a result of reviewing these 80 advance treatment projects and other information. As stated earlier, these problems were identified during the course of EPA's review of the 80 advanced treatment projects. While developing the agency's use attainability technical approach, we have conducted a number of case studies across the country. These studies have further confirmed that many of the problems associated with water

quality standards are not so much in their adoption but in their implementation.

Acting under the fiscal year 1983 Operating Guidance for the Office of Water, States are actively updating their continuing planning process [CPP] documents, under section 303(e) of the Clean Water Act, to incorporate technical procedures and policies dealing with the translation of water quality standards to enforceable permits. Adoption of such policies and technical criteria will, we believe in many instances, obviate the need to modify the water quality standards themselves.

For these reasons, it is my view that States will probably not be making major changes in uses. In fact, ASWIPCA has gone on record stating that they do not believe there will be major changes in the uses unless it can be demonstrated that the standards were inappropriate. Governor Matheson of Utah, chairman of the National Governor's Association, wrote:

> There have been charges that these proposed modifications will result in "pollution shopping" by industry. I believe that the integrity, sophistication and expertise demonstrated by State water quality programs renders these charges meaningless, and I repeat my assurances that there is no intention to relax the standards in Utah.

I wish also to emphasize the legal obligation EPA has to assure that State water quality standards meet the requirements of EPA's regulations and otherwise serve the purposes of the act. With much clearer technical guidance on an acceptable procedure for modifying water quality criteria, and an emphasis on the consideration of biological and physical data, as well as the traditional chemical analysis, any standards revisions which would have the effect of lessening water quality will meet a very difficult scientific test.

Additionally, EPA will focus its reviews of States standards revisions on the impact of such revisions on the ability of downstream States to meet their water quality standards.

Two, given the apparent technical complexity of the water quality-based controls, how are the water quality standards review requirements of the 1981 Clean Water Act amendments and section 303(c) of the act going to be met?

As you know, the 1981 amendments to the Clean Water Act preclude the award of Federal grants for the construction of publicly owned treatment works after December 1984, unless the water quality standard for the receiving water has been reviewed and, where necessary, revised.

To insure the most effective management of this review, the proposed approach encourages States to prioritize their efforts and focus first on those waters where technology-based controls have proved inadequate to achieve designated uses.

Our proposal provides that, where the State determines that technology-based controls are sufficient to meet the applicable designated uses, no further review will be necessary. States will thus be able to concentrate their efforts on addressing priority stream segments where water quality standards are needed and have a direct and immediate impact.

To assist in the review of high-priority waters, we have recommended that the State water quality agencies work with other State, Federal, areawide, and local planning agencies, as well as

the regulated community, in assembling the necessary data and in performing the analyses. Presently, although water quality data is being collected, it is collected by different groups—EPA, Geological Survey, State agencies, municipalities, local and areawide planning agencies, universities and the regulated community—for different reasons.

To assist States in establishing a coordinated monitoring program to develop data for this effort, we are preparing guidance on the institutional and technical factors to be considered in establishing such a program. From my own personal experience in Colorado, I have found that municipalities and industries are willing to assist States in gathering data for intensive water quality standards reviews.

From discussions with industrial representatives and statements made at the water quality standards public meetings, I believe that industry will assist States and that States will accept this assistance. States will, of course, need to outline explicit quality assurance and quality control procedures to be followed to insure good quality data.

In the final analysis, those who bear the cost of implementing control requirements under State water quality standards have the greatest stake in the water quality data that is considered in the decisionmaking process. Therefore, I am confident that, if a State so chooses, many of the data collection costs of revising standards can be passed on to the regulated community.

I might add in some cases I know of examples where that is occurring today.

Three. Will the technical tools and guidance themselves be available in a timely manner to accomplish the standards revision task?

For the past 2 years EPA has been developing technical guidance in support of States' water quality standards revisions. As mentioned earlier, EPA published, in October 1982, a Water Quality Standards Handbook designed specifically to clarify technical methodologies in carrying out water quality standards reviews.

In addition, the Agency has developed scientifically valid protocols for modifying recommended national water quality criteria on a site specific basis. Much of this work, in addition to other technical guidance currently under development, is described in a priority project plan "Standards to Permits" which we have appended to this testimony.

Four. What are the implications of a focus on protection of uses particularly in relationship to high-quality waters?

The proposed regulation on water quality standards focuses on uses to be made of the water. It is evident from research and experience gained over the years in implementing water quality standards that physical and biological, as well as chemical, data are appropriate in the determination of an appropriate water quality standard. For this reason we propose a new conceptual approach which focuses on uses themselves rather than on purely water chemistry.

In this regard we received substantial comment on the fact that the proposed rule no longer provides special protection for high-quality waters. High-quality waters are those waters where water quality is better than that needed to protect a fish, wildlife, or rec-

reation use. The current requirement specifies that a public hearing must be held before a State allows for water to degrade to the point of impairing the use. This is an issue of great concern to the public that will be addressed as we revise the regulation. I would appreciate the views of this subcommittee.

For the record, some explanation of EPA's reasoning for modifying this particular requirement is in order. Practically speaking, there are only two circumstances where the current regulation would affect high-quality waters and public hearings.

First is the introduction of a new source discharge into a particular stream reach where there is high water quality. Second is the renewal of a permit for an existing source where consideration is being given to increased wasteloading due to growth or economic development. There are at least two other existing public hearing requirements associated with such decisions.

First, States have adopted in their continuing planning process documents, in accordance with EPA's existing water quality management regulations, public participation provisions in the adoption of total maximum daily loads and incorporations of such wasteloads into State and areawide water quality management plans.

Second, when the permitting authority issues a new permit, or modifies an existing permit, public participation is afforded at the draft permit issuance stage. Clearly, then, our proposed modification of the existing requirement concerning, high-quality waters was not intended to eliminate public participation.

Five. What is the EPA trying to achieve in incorporating a benefit cost consideration in the adoption of standards?

Another provision of our proposed regulation that received substantial public comment was the cost-benefit assessment. As mentioned earlier in my testimony, we believe that the current economic test is unworkable and perhaps unrealistic. We are looking for an alternative, preferably one that was used elsewhere in the act. Although used in a different context, section 302 of the act does require balancing of economic and social costs and economic and social benefits to determine whether there is a reasonable relationship between the two in establishing more stringent limitations based on water quality considerations.

The rule, as proposed, allows, but does not require, States to conduct a cost-benefit assessment in determining whether there is, or is not, a reasonable relationship in requiring more stringent controls, after meeting the technology-based requirements, to achieve water quality standards.

This led people to believe that a cost-benefit ratio would be the basis of a water quality standards decision. This is not what we have in mind. Rather, we wanted a process that provides State decisionmakers and the public with information on impacts—the environmental and economic gains and the costs of the standards decision.

We did not conceive of a benefit-cost assessment as an academic exercise to quantify and assign a monetary value to all benefits. What we had in mind was a commonsense approach for determining what is economically obtainable in a specific location. This is

similar to what at least 15 States use as part of their water quality standards-setting process.

It is important to recall that States' standards are adopted by independent rulemaking bodies appointed by the Governors. These rulemaking bodies represent a broad cross section of interests within the State. Just as Congress makes tradeoffs, so do these relemaking bodies.

As we consider the cost savings that have resulted from our advanced treatment reviews—$.82 billion of projected capital cost deferred on 80 projects and an annual operation and maintenance savings of over $220 million—coupled with the potential backlog of $3.77 billion (as indicated in EPA's 1982 needs survey), we are simply looking for a more workable approach for considering economic impacts and costs in the State standards-setting process.

IV. CONCLUSION

Congress designated a partnership between EPA and the States in carrying out the Clean Water Act. This administration is trying hard to make that partnership a reality. EPA is responsible for the technology-based approach. EPA develops uniform technology-based effluent guidelines to ensure a minimum level of treatment nationwide. States have primary responsible for water-quality standards and the water quality-based approach. It is within this framework that EPA revised the water quality standards regulations.

States set their own water quality standards by deciding the uses to be made of the waters and by setting criteria to protect those uses. EPA's responsibility is to ensure that States' standards "protect public health or welfare, enhance the quality of water and serve the purposes of the act."

We believe this to mean that in reviewing States' standards, EPA must carefully review any changes that might in any way adversely impact public health or welfare, the quality of water or the goals of the act. States will have to demonstrate that any lowering of their water quality standards is appropriate and scientifically valid.

EPA will critically evaluate the analyses States submit as justification of one, changes in criteria which might adversely affect designated uses, or public health or welfare; two, uses which appear inconsistent with section 303(c) of the act; or three, uses which might preclude attainment of the goals of the act where these uses are attainable.

In carrying out these responsibilities, EPA will work closely with States in supplying them with the latest information on criteria and methods to evaluate the attainability of uses.

In this way we believe that we will be assisting States to set appropriate water quality standards, rather than setting State water quality standards for them.

Mr. Chairman, this concludes my statement. I would be happy to answer any questions that either you or members of the subcommittee may have.

Mr. ROE. We want to thank you for your presentation, and we are also pleased to note, members of the committee, that you have

gone into the issue in depth, and let me offer a compliment to you, representing EPA, at the opening of these hearings, which is a little hard to come by today——

Mr. EIDSNESS. Thank you, sir.

Mr. ROE. I think you have been somewhat evenhanded. Although I don't agree with your conclusions in toto, you have been evenhanded in recognizing that all of the decisions made over the years by EPA may have not been sacrosanct unto themselves in the area of technology that we are dealing in.

So I think you have tried to present some kind of a reasonable balance here as to why you are making certain recommendations for changes in those rules and regulations.

Having said that, I would defer to the distinguished gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Eidsness, again I want to compliment you on an excellent presentation. I am anxious to get into it in more depth in the future hearings, which the chairman has said we will have.

Mr. Chairman, the thought occurs to me, that, for many of us who are fairly new in this area on the committee, at some point in time it might be helpful to us to be walked through the system step-by-step. It might be good to take a specific body of water, such as a specific lake, river or stream in some State, and just have us see how the whole program is designed and functions to protect the quality of the water. We need to fully understand how the quality standards are set, when they started, and where we need to go with them.

I just suggest this for your consideration. I think it would be helpful to me to better understand some of the things we are talking about, and I think it would be helpful to many of the new members who aren't as conversant and familiar with this subject as you, the chairman, and some of the more senior members might be.

Mr. ROE. Very good.

Mr. STANGELAND. Mr. Eidsness, when did the Agency begin the regulatory review activities that culminated with publication on October 29, 1982, of the proposed regulations?

Mr. EIDSNESS. My understanding, sir, was that the origin of this was a notice in the Federal Register calling for public comment on July 10, 1978. I came on board approximately a year ago, and that is when I became involved in this particular issue.

Mr. STANGELAND. What prompted the Agency to initiate the process? Did the EPA receive any formal requests for proposed rulemaking concerning the regulations, and if so, by whom?

Mr. EIDSNESS. I will have to ask Mr. Schatzow to answer the second part of that question, since I wasn't here back in 1978 when that notice was sent out.

Steve, do you recall any specific request for changes?

Mr. SCHATZOW. I don't recall any specific formal request at that time. There were a variety of concerns both internally within the Agency as well as outside the agency with the water quality standards program, in terms of its coverage, of numerical criteria, in terms of use, in terms of the downgrading provisions. That sparked our interest at that time.

Mr. EIDSNESS. If I could elaborate, sir, from my perspective, there are really at least two major reasons why we are moving forward. One is that EPA does see, hopefully, the light at the end of the tunnel with respect to meeting its commitments to establish national technology-based standards, particularly with respect to best available technology for the control of toxic substance discharge from industry.

We have a good track record in the last year of getting 29 draft and final EPA guidelines for the major industries out, and we are in fact writing guidelines for the basis of those requirements. It is clear to me, as a professional area for this in the last 15 years, that we are going to have to rely more on water quality standards as designed in the act to make further control decisions, and we want to be sure that States have adequate guidance and technology assistance to do that.

Second, in 1981 the Congress and the President signed an Act amending the construction grant program which I made reference to earlier in my comments this morning that basically says that, after December of 1984, no construction grants will be awarded within a State to those particular facilities that are discharging into a receiving stream, unless the water quality standards for that particular stream have undergone a review and revision, if necessary.

The impetus behind that, in my view, was at least in part the concern expressed, from the Appropriations Committee charge to us that the Congress is worried about the effectiveness of spending Federal taxpayers' dollars in the construction grant program. We fund 70 percent of the sewage treatment plants. If the States address those kinds of problems initially, their water quality standards would be better off overall.

With that short time, for those States to do those reviews—we are talking about a year and a half—clearly a lot of this technical guidance is needed now.

Mr. ROE. Will the gentleman yield?

Mr. STANGELAND. I will be happy to yield.

Mr. ROE. One of the issues facing the committee is based upon whether or not the committee should extend the BAT situation, or best available technology, or any one of those standards, simply because the agency has not completed its technological analysis. I think it was 34 different groups you were to work on.

You say you have 29 going now and there was some controversy before you came here over the last 10 years that it took too long to get that done.

Now, if we are at 29 and we are getting to that point, what is the push and shove? Why wouldn't you wait until you finished the BAT situation, the best available technology analysis of the 34 elements?

How can you expect the States to make a judgment? I am asking this as a question. How can you expect the States to make a judgment if you don't have the technical data before them? That is one of the reasons why industry is importuning this committee and the Senate to extend this whole program by 3 years or 48 months, whichever the case may be. I am sure you are aware of that.

Mr. EIDSNESS. Yes.

20-955 O—84——10

Mr. ROE. In other words, what is the rush to judgment here? What is the immediate need to change the regulations, because fundamentally—and I didn't want to ask these questions initially; maybe I should have—fundamentally you are changing the exact direction in which the Congress meant this bill to go in the first place. That is my opinion.

Mr. EIDSNESS. Well, sir, that is certainly not the intent.

Mr. ROE. Having helped to write the law in 1979.

Mr. EIDSNESS. That is certaintly not my intent. The water quality standards regulations in no way affects our obligations under the Clean Water Act to set technology-based standards; for example, BAT guidelines.

Mr. ROE. If the gentleman would yield, that is not really quite accurate, is it, because we are coming back and saying that there are two things that people have to accomplish. They have to accomplish the best available technology. That is what we said they had to do, and then we had other particular elements of the bill which had to do with pretreatment on different types of chemicals, heavy metals and things of that nature, many of which regulations have not been written on as yet.

The fact of the matter is industry has been held up all over the country as to what they should or should not be doing, waiting for some kind of a definitive direction to go.

Now we are coming back and saying that we are going to reverse the emphasis, we are no longer coming back and saying that we are dealing in fishable, swimmable waters, regardless of what the States did or did not adopt. We are coming back and saying that we are going to be dealing in the assimilated load that the receiving waters may be able to sustain.

Basically, that is what you are saying in this, and then you are coming back and saying: Well, OK, maybe we don't have to look too far at those that are not really problems now. We will only look for those that are in trouble now, and so forth and so on. That is what I am hearing from your testimony.

Mr. EIDSNESS. Congressman, I appreciate your concern. I think I understand the question more clearly now. I think I can clear this issue up. When EPA establishes a national technology-based control, such as an effluent guideline, the statutory test that we must meet is consideration of available or demonstrated technology and costs.

Mr. ROE. Right.

Mr. EIDSNESS. EPA does not look and does not know whether the resulting regulations are adequate to protect water quality under State water quality standards, because we don't look.

Mr. ROE. I am thoroughly aware of that.

Mr. EIDSNESS. OK, the second point is that once——

Mr. ROE. How do you judge what the best BAT is going to be if you don't look?

Mr. EIDSNESS. That is because of the way the law is written. Very simply, the only thing we look at——

Mr. ROE. You are supposed to write the criteria.

Mr. EIDSNESS. Well, that is part of the confusion, unfortunately. The statutory tests for a technology standard are the cost and tech-

nology. We do not look at environmental benefits as a statutory basis for that decision.

Mr. ROE. Do you think the law ought to be changed on that if we are not looking to the environment: What is the whole purpose of the bill, sir? The purpose of the bill is to protect the health and the quality of the water supply for the people.

Mr. EIDSNESS. Yes, sir.

Mr. ROE. It is the environment that creates that issue?

Mr. EIDSNESS. Yes, sir, I think the answer to that question has to come in somewhat of a historical context. Prior to 1972, as you know, there was no effective enforcement program under the Clean Water Act, Public Law 660, for example. There was no technology-based requirement, there was no enforceable permit requirement.

Mr. ROE. We are aware of that.

Mr. EIDSNESS. In 1972 Congress said we are going to have technology-based controls, and EPA is going to set them uniformly and nationwide by classes of industry and municipalities. We have done that and we are doing that now for the last classes of industry.

In the process of doing that, looking at the technology and cost, we come up with limitations which are put in permits, but whether or not in these particular limitations there is any real relationship to what is needed to protect a stream is not part of our statutory mandate. That is where water quality standards come into play.

Mr. ROE. If the gentleman would yield.

Would you think, then, that you would have the right to rewrite the regulations without getting statutory authority, or are you interpreting what you believe your statutory authority to be? It is a legitimate question.

You talked about the light at the end of a tunnel, that we are making progress, and that is why I asked you specifically about the $1.67 billion versus the $0.82 billion saving, because you looked at the cost, is what you said, in improving that situation, on the 80 cases that you reviewed. Isn't that a correct interpretation of what you said?

Mr. EIDSNESS. We looked at the cost and the water quality.

Mr. ROE. Therefore, you make some judgmental values as to whether or not it was achieving the goals intended with the investment that was involved, and we could save taxpayers' money, is that what you said?

Mr. EIDSNESS. That is in effect what the Appropriations Committee required.

Mr. ROE. Where does the agency believe it has the authority? If you say it is not statutory in nature, which is what I understood you to say, where do you believe you have the authority to change the law by issuing new regulations?

Mr. EIDSNESS. Well, Congressman, we are really not changing the law.

Mr. ROE. We happen to think you—but go ahead. There is a lot of disagreement.

Mr. EIDSNESS. What we probably need is a good lawyer here. I am not a lawyer. Perhaps you are. My understanding is that there is no statutory link between section 303 of the Clean Water Act, which is the water quality standards provision, and those other provisions of the act where EPA sets national technology-based

standards. In other words, anything we do with the water quality standards regulation in no way modifies, or alters what we are required to do, and are in fact doing.

Mr. ROE. Then, why are you making the regulations in the first place?

Mr. EIDSNESS. The reason is, Congressman, that we have, through 10 years of experience in this program, learned about a number of problems that have arisen, and I tried to cover them in my testimony. In addition, we have a new law, 1981 amendments to the——

Mr. ROE. I helped write that law. I know what was in the law, and that law has been partially thwarted by EPA.

Mr. EIDSNESS. We felt it made sense to go forward to try to circumscribe an approach to regulating under water quality standards which reflected the experience States, EPA and others have accumulated over the last 10 years.

Mr. ROE. Didn't the gentleman say that in the present methodology under the law, that there wasn't as much emphasis placed on the cost of making, of constructing or building plants, advanced technology, and so forth, and now we are coming back and saying that we have to look at that more assiduously? Isn't that what you were saying in part?

Mr. EIDSNESS. Well, that is in effect what the Appropriations Committee report said in so many words, and we have been following that mandate since 1979.

Mr. ROE. Yes; but they are not the authorizing committee. But go ahead.

Mr. EIDSNESS. We view it as a legal obligation.

Mr. ROE. You have a requirement that you do that, that is right.

Mr. EIDSNESS. It does create somewhat of a dilemma, Congressman, because those advance treatment projects were determined on the basis of State-adopted and EPA—approved water quality standards, and clearly in my mind the Appropriations Committee was saying: Let's be sure that notwithstanding how those standards were written or interpreted, that when the rubber meets the road and we have a public financial decision on the line, are there going to be any environmental results, water quality improvements that bear a reasonable relationship to the cost.

EPA has proceeded to review 80 projects, as I mentioned, and we have learned that there are some technical problems and some past policy problems associated with the way in which standards were adopted and implemented. Many of these problems are problems that States are fully aware of and are correcting today.

Our proposed regulations and the technical guidance are designed to try to remedy some of these problems so that, hopefully, one day EPA will not have to conduct such advance treatment reviews because State standards are in fact a very good regulatory tool which do take into consideration cost.

Mr. ROE. Do you observe your proposed change in the regulations only to relate to advanced treatment?

Mr. EIDSNESS. Yes; because by definition——

Mr. ROE. You are not speaking about secondary treatment or primary-secondary treatment?

Mr. EIDSNESS. No, sir, secondary treatment is the analogy to BAT or BCT or BPT. It is a technology-based standard for municipalities, so what our regulations do has no effect on the secondary treatment definition or how it is to be applied.

Mr. ROE. You are not talking about changing anything in the secondary treatment aspects?

Mr. EIDSNESS. Not now, sir. As you are well aware, however, because of the 1981 bill, we are directed by Congress to revise the definition of secondary treatment, which is a technology-based standard, and we are in the process of doing that and hope to publish a proposed rulemaking in the next couple of months in that area.

But in terms of the water quality standards regulation, the advanced treatment processes that we are talking about here are requirements that result from water quality standards adopted by States.

The secondary treatment requirement is an EPA national uniform technology-based standard. Nothing in the water quality standards regulations impinges, alters or modifies the requirement to meet secondary treatment under law and EPA regulation.

Mr. ROE. The gentleman from Minnesota.

Mr. STANGELAND. Thank you.

Mr. Eidsness, under the new regulations is there anything that a State or anyone else will be able to do that can't currently be done under existing regulations? If so, could you explain?

Mr. EIDSNESS. I would like to provide, for the record, a specific written response to that, but I will give you a couple of examples. Generally the answer is there is very little real substantive change concerning the existing regulation and the future regulation.

Probably the most significant of all changes that we are bringing about is to adopt a downgrading policy in our new water quality standards regulation. The issue of downgrading has been a very controversial one, and I have learned that EPA does not now have, under its current water quality standards regulations, a legal downgrading policy. The one that EPA has is invalid. It is invalid because in 1975, when EPA proposed the initial water quality standards regulations, it reserved the discussion of downgrading.

But when it promulgated a final rule, it included a downgrading policy, and in the context of a lawsuit or a court action that we got involved with in the State of Ohio in the last couple of years, EPA learned that we had not acted legally. Therefore, the policy that EPA has been operating under in terms of downgrading is invalid. So one of the significant things we are doing is trying to have in our regulation a downgrading policy which we do not now have.

[The question posed and the response received from Mr. Eidsness follow:]

Question. What activities are allowed the state under the proposed regulation that are not allowed under the current regulation?

Answer. The current regulation could be interpreted under sections 35.1550 (a)(3) and (c)(1) as allowing the development of site-specific water quality criteria and the analysis of attainability of uses, perhaps including a benefit-cost assessment. Unquestionably, EPA's interpretation and application of its regulation, and the lack of definitive guidance offered to the States precluded the States from executing those policies.

In order for EPA to issue and implement the major policy changes described in its proposed regulation, the Agency would have had to follow virtually the same procedures as are necessary for developing a regulation (i.e. Agency review, OMB clearance, public notice and comment). This is due to two factors: (1) current Administration procedures, and (2) previous court decisions have not looked with favor upon Agency actions based on policy guidance which was not clearly supported by a regulatory provision or was not subject to public notice and review.

Overall the proposed regulation is more descriptive and definitive in what is required and expected in the standards program. Under the current Regulation supporting guidance on 10 specific subjects is needed to describe Agency policy and requirements on a variety of issues. This operating guidance did not receive the same level of distribution, review and comment as the Regulation. The support guidance on the proposed regulation, although extensive, covers only 3 subjects, so there is a reduction in the use of guidance as de facto regulation. It also received considerable public review.

The proposal more adequately spells out the appropriate State and Federal roles and explicitly extends Federal review and authority over all general policies applicable to State standards which may affect their application and implementation. In addition, the proposal also provides for the consideration of seasonal uses and the adoption of subcategories of the aquatic protection use.

The proposed regulation provides three additional factors which may allow a stream use to be modified. NOTE: Section 35.1550(c)(3) of the current regulation specifying factors to be considered in justifying stream downgradings was not subjected to public comment when promulgated and is thus invalid.

Mr. STANGELAND. This is, I guess, one of the concerns that some States have. Some—the State of New York, for instance—have expressed concern that the proposed regulations may be interpreted by States as an opportunity to allow for the downgrading of water use based on a liberal reading of the new regulations. How does the agency intend to prevent this from happening? In what kind of specific instances would you want to be downgrading?

Mr. EIDSNESS. Well, I think there are two issues to answer that question, sir. One that I have personally noted with great interest, having attended two of these hearings myself, and that has generated a great deal of concern about modification of the policy on high-quality waters, dates to public hearings. There seems to be widespread support for retention of a policy that would require a specific public hearing be held before a State would allow high-quality waters to be degraded even though it would not impair the use itself. I am impressed by the depth of that controversy and the wide scope of it, and I am very persuaded by that personally.

The other issue with respect to downgrading, is that some States, when they initially adopted their standards in 1972, did so without benefit of any real analysis of what the streams could support in the way of uses.

For example, a State might have adopted a standard for a cold-water trout fishery on a particular stream, and found as a result of subsequent field monitoring data that because of temperature, or because of other physical conditions, there was no way in which you could in fact have a cold-water trout fishery. So our policy would allow them to correct that. But I don't view that as a downgrading. It is more of a correction——

Mr. ROE. Come on, come on, there are people here that are technically trained. Cut that out. That is only an analysis that you are making if somebody wants to put in a trout fishery, and that can also—if the gentleman would yield—mean there would be 20 other things that people want to do in that stream. Now, don't kid us on

that. That is not fair play and that is not intelligent coming from you.

Hear me out. The gentleman is simply asking you, why does EPA want to participate in any downgrading? That gets to the nub of what the change in this policy is truly about. What this policy is you are trying, you, generically speaking, your agency is attempting to set a new set of standards that will achieve the following. It will come back and say that we will no longer look to BAT and technological solutions to the situation.

What we are going to be looking to—you keep shaking your head, sir. If you want to come up here and testify, then I would like you to do it. What I am trying to get at, what are the assimilation capabilities of those waters for more pollution that is involved? To what level do we want to do that economically?

That is, basically, what this issue is about. What the committee is coming back and saying is that we have gotten this far and there is a light at the end of the tunnel, and so forth. Why do we want to denigrate or why do we want to reduce the quality of the waters in the country? That is the question that the gentleman is specifically asking you.

To what benefit does the country derive by doing that, and doesn't that change the ultimate policy that we had involved in the 1972 law?

Mr. STANGELAND. Mr. Chairman, if I can reclaim my time and phrase the question in another way?

Mr. ROE. Go ahead.

Mr. STANGELAND. Has there been indication under the present regulations that States have set water quality standards on a stream, river, or lake, that were far too high, and unattainable, and perhaps unnecessary? We have heard testimony time and again from various individuals who describe a system wherein the water coming from their system is far cleaner than the water receiving the discharge.

Have you found instances where you just can't attain the water quality levels established by the State, requiring a more realistic level of water quality standard for that body of water? Is that the purpose of this? Forget the trout stream. I think that is an extreme example. Is that the purpose?

Mr. EIDSNESS. If I understood the question correctly, sir, yes. There would be instances where a State would be able to modify its standards so that it would take care of the concern that you mentioned.

However, I must also say that the policy, as we proposed it, says that whatever the use and the quality of water necessary to protect that use that is either in effect today or as it relates to November 28, 1975, which is the date of the last regulation, or would be attained as a result of the imposition of national technology-based standards; in other words, secondary treatment gets on-line or BAT get on line for a particular industry in that stream, then that use and that quality must be maintained.

By the way, if you will permit me, that extreme example I gave you gentlemen really wasn't that extreme. It was my own personal experience in Colorado. I spend 5 years studying that very issue

and it was a real life example that had very major environmental and public finance implications.

Mr. ROE. The gentleman from New Jersey doesn't mean to be facetious either, but by the same token are we just going to take one particular example for any particular river—and there's 1 million things to discuss here yet today and in the next ensuing days—and if it doesn't meet that then we will degrade the river.

Mr. EIDSNESS. Yes, sir; in the appendix to the long testimony we have examples that will clarify the question you asked, sir, on this issue of making modifications.

Mr. STANGELAND. I have just one more question, Mr. Chairman, and then I will yield to some of the other members. Isn't it true that nothing in these regulations changes the technology-based requirements of the Clean Water Act?

Mr. EIDSNESS. Yes.

Mr. STANGELAND. Thank you.

Mr. ROE. The gentleman from Michigan.

Mr. ALBOSTA. Thank you, Mr. Chairman.

I would like to remind our witnesses here this morning that last December the Subcommittee on Investigations Oversight had hearings in Texas pertaining to the Clean Water Act and the continuation of it, and the problems that might be encountered there in that State, with reducing the amount of funding, pulling the grant money on the Federal level from States to complete their particular systems, and that we found from the testimony of the mayors there that it would not be feasible to try to meet the clean water standards set under the act in a full funding way.

Furthermore, that there was a lot of pressure put on, I believe, States or the departments of natural resources, whoever is implementing the act in those States, from industries that are located in those States. I noticed in your statement you have a quote from Governor Matheson, I believe, from Utah.

Mr. EIDSNESS. Yes, sir.

Mr. ALBOSTA. It may very well be that the Governor would not intend to relax his regulations to accommodate industry in that particular area, but it could be that other States would find that they may have such high rates of unemployment and so forth that they would have to relax their particular positions in order to accommodate that industry, so that it would not threaten to move or actually move out of that State and go somewhere else.

I would like you to comment in your own personal opinion as to whether or not you think the States can pick up the costs of implementing the Clean Water Act, continue to improve and build the structures necessary to meet the standards or the quality of water under the act, and whether or not you think there is any particular problem with States relaxing their positions pertaining to pressure that might be put on them by some industry.

Mr. EIDSNESS. I would be very happy to, Congressman. With respect to the question of "industry shopping," that is the term that you typically read about in the paper, would industry look for a State that had weaker standards or, alternatively, would a State lessen its standards somehow and by doing so attract an industry so it could help an unemployment problem that they were facing in that particular State.

I personally believe, having been in this field for 10 years now, more than that, actually 15, that industry shopping under the Clean Water Act of 1972 is an academic issue. It is not a real live issue, and let me tell you why.

Industries must meet the national technology-based standards, wherever they go. It doesn't matter where they locate. They must comply with EPA's regulations or its limitations imposed on their facilities.

Second, industry shopping implies a new source, a new industry. Usually, under the Clean Water Act, new source standards are more stringent than existing source standards. In fact, under a number of the effluent guidelines that EPA has proposed or finalized in the past year for toxic control, there are a number of subcategories where the new source standard is zero discharge. So you can't get any more stringent than that, no matter how hard you try.

A third reason is that industries—and this comes from my own background and experience as a consultant in this field as well as comments made at public meetings by industry representatives—industry considers a wide range of things before they make a decision to locate a new facility. Among them are, obviously transportation availability, communications, a cheap labor force, social local amenities in terms of housing and infrastructure to support their own employees and pollution control, of course.

So I think that the effect that the cost of pollution control has on their decisions, based on their own words, are very minimal. I don't see this as a real, practical issue at all, because really, we are talking about a case where industries are regulated very strongly by the Federal Government no matter where they locate. If they go any further than what the Federal requirements are, it will be based on State water quality standards, and I think that is the area of concern that you are really expressing.

Now with respect to the costs, and will States be able to carry out the standards approach. I can only say that they have been very successful for the past 10 years, not without some problems and not without some controversy.

But they have been doing so. States have developed a great deal of expertise, although I know they don't have all that they would like to have, and I certainly hope you will ask State representatives at your hearings next week, or whenever you hold them, as to what their views are on this.

Mr. EDGAR. Would the gentlemen yield?

Mr. ALBOSTA. Yes; I would yield.

Mr. EDGAR. To the question of cost, which I think is an important one that the gentleman is raising, on page 28 of your detailed statement, you indicate that 10 to 14 percent of the States water quality budget would be required for most States to carry out the review you would require of their water quality standards.

Which budgets are you talking about, the current budget or one that is left after EPA cuts back its State grants by 56 percent, as proposed by the 1984 budget? How can States do what we are asking them to do, if we cut back their funding at the same time we are asking them to use more of their budget?

Mr. EIDSNESS. The 1981 Clean Water Act established a new funding provision, section 205J which is specifically earmarked for just this sort of thing. It provides up to one percent of the State allocation of construction grant funds. In 1983 we had $2.4 billion nationwide, for construction grants so we have $24 million to allocate to this sort of activity.

Mr. EDGAR. You said $24 million. For 1984, haven't you dropped from $54 million to $24 million, and in Section 106 grants?

Mr. EIDSNESS. I am not sure those are the correct figures. It sounds about right, but there are three funding sources under the Clean Water Act that can be applied to this sort of thing, and that is the problem in the confusion on the budget. One of them is section 106. The other is section 205G, which supports the construction grant administration.

Mr. EDGAR. That has been cut.

Mr. EIDSNESS. The other one is 205J. No, the 205 G and J are tied to the construction grants authorization, which has not been reduced. We are proposing reductions in the 106 funds, but I might add that overall, at least last year, the States had available for funding activities collectively under 205J and 106, $98 million, which was about $50 million more than they had the previous year. I am not so certain I see a hardship in terms of the dollars that I am responsible for allocating.

Mr. EDGAR. I was just going to ask one followup question as to whether or not the States in their reaction to your proposed rulemaking indicated any distress about the cost.

Mr. EIDSNESS. Yes, sir, and we will provide that for the record.

[The following was received for the record:]

Mr. EIDSNESS. Of the 47 States and territories commenting on the proposed Regulation, 22 mentioned the availability of both State/Federal resources as a potential problem. These 22 were about evenly divided between States tending to favor the proposal and those who don't.

Mr. EIDSNESS. There certainly is some concern about the cost of implementing our approach, but let me also make one note of clarification. States are under an obligation to review their water quality standards. They revise them as appropriate. As appropriate is their determination. Fundamentally, unless we see that they have a standard which does not meet the purposes of the act. Then we have an overriding authority to do something. So I think as the States establish a priority for which streams they are going to look at first, second, and third, and follow that priority carefully, then they will be able to over time conduct the kinds of reviews that they need to.

It may be just a question of timing more than it is resources, in my mind.

Mr. ALBOSTA. What pollutants do you consider now, or toxins do you consider now that are detrimental to the water quality? Which ones have you identified?

Mr. EIDSNESS. Well, just about any pollutant in a sufficiently high enough——

Mr. ALBOSTA. Pollution could be organic pollutants. I am talking about toxins.

Mr. EIDSNESS. Yes, sir, EPA has in the Federal Clean Water Act what we call priority pollutants. It includes heavy metals, organic

chemicals, inorganics, a lot of things that you read off of periodic tables if you ever had a chemistry class in school. That is what we are regulating under the National Technology Standard, but I might also add that States and EPA currently are requiring industry discharges in some regions of the country to monitor their effluent, to find out what toxic substances are there that the EPA regulations are not adequate to control, and therefore, would need further regulatory controls under State water quality standards.

Mr. ALBOSTA. Then you are saying there are toxins there that the EPA does not control, such as dioxins?

Mr. EIDSNESS. Well, EPA does regulate the priority pollutants, the toxic pollutants under the National Technology Standards, but once again when we do that, we only look at the cost and technology. We do not know whether the degree of reduction of pollutants resulting from that technology is adequate to protect the stream on a site-specific basis, because we are not authorized to make that determination.

Mr. ALBOSTA. Do you know of any way that any of our advanced technologies can separate from water quality dioxins that are in there in parts per billion?

Mr. EIDSNESS. I don't know personally, sir, but I will get a response for the record on that one. I don't believe I have one that you want to hear in answer to that question.

[The following was received for the record:]

Dioxins are highly insoluble, highly adsorptive organic chemicals which by virtue of their chemical structure are difficult to destruct. The most prevalent dioxin (TCDD derived from 2,4,5-T) enters the environment by adsorption on particulate matter.

Dioxin enters the waterways through point and non-point sources adsorbed on solid particles. If it is formed in the water from other chemicals as a result of unusual existing conditions, it will be removed most likely almost immediately by adsorption on suspended matter due to the very low solubility. Therefore, the most expedient and effective way to remove dioxin from water is by removal of suspended matter. If there are insufficient adsorption sites available, then flocculant materials such as ferrous salts or clays, followed by settling and/or filtration could be used.

In view of its chemical nature, and insolubility, dioxin is not destroyed by aerobic bacteria, but by analogy to PCB's, it has the potential of being destroyed by anerobic bacteria and also, under chemical or electrochemical reducing conditions and high temperature incineration or pyrolysis. Ultraviolet radiation can readily destroy dioxin after it has been extracted from water by organic solvent. Once again, its high water insolubility enhances its removal by solvent extraction, as well.

Mr. ALBOSTA. I want to elaborate just a little bit further on the problem that I see with implementing the law itself. The mayors of cities like Austin, Tex.; like San Antonio; like Houston; like Port Arthur, Tex.; all testified that there was no way if we cut off federal funding that they would be able to build and bond themselves and increase the cost for the sewer service itself to be able to provide those sections of their city, which are the lower income parts of their city, with sewer service.

It would not work. They would have to go up seven or eight times, maybe even further that that in the cost of that service, so it seems to me like there is a necessity for us to continue the percentage of funding by the Federal Government to accomplish our goals under the Clean Water Act.

I think that there has been recommendations by the Environmental Protection Agency to cut back on the funding for the grants program, and that it will not be accomplished it that happens.

Mr. EIDSNESS. Congressman, the President has requested for fiscal year 1984, $2.4 billion for financial aid to municipalities for the construction of sewage treatment works.

Mr. ALBOSTA. I am not sure that I know the exact figure, but do you know what it was three years ago?

Mr. EIDSNESS. It was the same.

Mr. ALBOSTA. Do you think just the same amount today will build the same structure it would have been built two years ago?

Mr. EIDSNESS. Well, with the rather dramatic lowering of inflation it is going to cost a little bit more, but I think that obviously the cost of sewage treatment control is a concern in municipalities. I have professional experience in public finance, working for municipalities doing facility planning and public financial, and I know from personal experience that good sound public financed policies can indeed pass on some of these costs to new growth and new residences at a reasonable price, and not penalize existing customers in such a way that local governments bear a greater burden.

Mr. ALBOSTA. Are you saying that all of the mayors who testified in Texas during that hearing, which is part of our record, testified falsely that they really could pick up that cost, and they won't have to raise their rates as much as seven times or more.

Mr. EIDSNESS. I have no personal knowledge of what they said. I just state from my own experience that there is a great deal of creativeness that is yet to be tapped in local government to find ways of financing their infrastructures including sewage treatment facilities. EPA, as you probably well know, in the past has financed reasonable sewage treatment facilities for substantial new growth. What that means is the Federal Government has subsidized new growth, and the Congress in 1981 amended the act.

It basically said that after 1984 the Federal Government would not be subsidizing new growth.

Mr. ALBOSTA. Let me interrupt you, if I can.

Mr. EIDSNESS. Yes, sir.

Mr. ALBOSTA. What happened prior to the Clean Water Act? What happened prior to the clear water grant program? What did we do 15 or 20 years ago?

Mr. EIDSNESS. Fifteen to 20 years ago, I think there was a grant program that was at a lower percentage rate, at 33 percent, as I recall. There was a Federal grant program.

Mr. ALBOSTA. What happened to our water quality during that period of time?

Mr. EIDSNESS. I don't know, sir.

Mr. ALBOSTA. You don't?

Mr. EIDSNESS. I wasn't here in the job 25 years ago.

Mr. ALBOSTA. I know, but you must know that our water quality dropped drastically in the last 20 years.

Mr. EIDSNESS. Well no, sir, I don't believe that our information shows that overall, but what I would like to do is provide a written response to that question. We have substantial information, I don't know how far back it goes, that shows what the improvements in water quality are.

As a matter of fact, States under section 305B of the Clean Water Act are required every 2 years to submit a report to EPA which we then compile and submit to the Congress. I would be very happy to provide a summary of that information for the record. I think it is a better picture than perhaps you might think.

In fact, as I mentioned in my written testimony and my oral statement this morning, based on the recent information we received from the States under section 305B concerning the status of water quality, it appears that the great majority of streams do in fact meet what we call the fishable, swimmable goals of the Clean Water Act.

[The following was received for the record from Mr. Eidsness:]

Our limited water quality trend information going back to 1963 shows that we have been successful in cleaning up gross, overt pollution in many of the Nation's waters over the past 20 years. A study of water quality trends between 1963 and 1972 for 22 of the Nation's major waterways indicated that levels of 20 of the 28 water parameters analyzed—primarily conventional pollutants such as suspended solids, turbidity, and ammonia—had improved over that time period. This study showed that, while more rivers were moderately polluted in 1972 than in 1963, fewer rivers were highly polluted.

The 1982 State reports submitted pursuant to Section 305(b) of the Act show that water quality is improving in many of the Nation's rivers and streams. Thirty-three (33) States reported water quality trend information; of these, 21 cite generally improving trends, and 12 report generally stable trends. Twenty-three (23) States report some localized examples of degradation, but none cite Statewide degrading trends.

Estimates of progress toward the Act's "fishable and swimmable" goal were provided by 20 States. These 1982 estimates range from a low of 66 percent of Rhode Island's 329 assessed stream miles to a high 97 percent of New Hampshire's 14,500 stream miles. Goal attainment was assessed differently by different States, and therefore no precise national conclusions about percent of waters meeting the goal can be drawn. However, these estimates do indicate that a majority of the Nation's waters already meet the 1983 goal.

In addition, 35 States cite improvements in their waters as a direct result of the construction of wastewater treatment facilities, and 18 States report improved water quality due at least in part to pollution controls implemented by industry.

Thus, while there continue to be some persistent water quality problems such as toxic substances, the 1982 reports indicate that progress in cleaning up our Nation's waters has been made, and is continuing.

Mr. EIDSNESS. That says in my mind that we have very high quality water. Clearly, there are a lot of areas where we do not, and you would expect to find those areas below a municipality or below an industry.

Mr. ALBOSTA. If that is the case, and it is so easy to do, why are you proposing that we relax the regulation?

Mr. EIDSNESS. We are not proposing that, sir. We are trying to strengthen the effectiveness of water quality standards to regulate pollutants where technology based standards are inadequate to do so.

Mr. ALBOSTA. Not in the secondary treatment?

Mr. EIDSNESS. That is right. What we are doing here has no relationship to the secondary treatment definition, sir.

Mr. ALBOSTA. I have no further questions.

Mr. ROE. The gentleman from New York.

Mr. MOLINARI. Thank you, Mr. Chairman.

I am sorry I missed the earlier part of your statement and some of the questions. I hope I am not repetitive. I am a little confused. I didn't study chemistry back in my academic days, so you will have

to bear with me, but a brief perusal of the proposed modifications leaves me with the impression that indeed the net effect would be a lessening of water quality in certain bodies of water in this country.

Am I correct in that assumption?

Mr. EIDSNESS. I certainly hope not. My own personal view, and I believe it is one shared by the administrator, is that we ought to be getting the highest water quality we can possibly achieve in this land. What we are trying to do is focus the regulations in such a manner that States can on a priority basis clean up streams that are of great importance to them and get the job done and move on to the next stream. It is not to relax water quality.

Mr. MOLINARI. Did I understand you to say that you believe that the States have shown and demonstrated the capability of doing so and the willingness to do so?

Mr. EIDSNESS. Oh, absolutely. I think that States have been very vigorous in regulating pollutants under the Clean Water Act under their water quality standards, and enforcing such requirements, yes, sir. I am very pleased. That is a commentary on the effectiveness of the Clean Water Act and the wisdom of Congress when it passed it in 1972.

Mr. MOLINARI. And as a consequence, you believe in turning more of the decisionmaking process over to the States?

Mr. EIDSNESS. I don't think we are talking about turning over more decisionmaking, sir. I think we are trying to follow what the law says as we understand it, which is to say there is a partnership between EPA and States.

Mr. MOLINARI. How does New York State fit into your classification of the States that have performed well?

Mr. EIDSNESS. I don't have any specific examples to give you of where they have performed well, but I have no reason to believe that the State of New York is not an effective regulatory agency, under the Clean Water Act. They, in fact, issue permits, enforce those permits, and so far as I know they are doing a good job, sir.

Mr. MOLINARI. I guess sometimes we can only relate to those problems that we have within our own district, and certainly my experience is somewhat different than what you are saying in your testimony here today. I have a memorandum from CRS, which is dated March 4, 1981, almost 2 years ago, which was in response to my concerns that the water quality standards of New York State were not being met, and the State of New York was not doing what it was supposed to do to comply with the Clean Water Act. In the response that I received from CRS, I found that water quality standards were adopted in New York State in 1974, and as late as early this year they had yet to update those standards, even though the Clean Water Act called for revision every 3 years.

We are talking about 9 years, so I am at a loss to understand how at this point we are going to say to the States we are going to give you a greater role in the decisionmaking processes.

Mr. EIDSNESS. Sir, the intent is not to give them a greater role but to more carefully circumscribe what that role is so they understand what their responsibilities are. To answer in a historic context when the 1972 act was passed, EPA's attention was focused primarily on the new technology performance.

Mr. MOLINARI. May I interrupt?

Mr. EIDSNESS. Yes, sir.

Mr. MOLINARI. How about the funding? Is there any concern that you have that they would have the necessary funding to perform the job?

Mr. EIDSNESS. Yes, I course, I am concerned, but I am a manager, and any manager will tell you that funding problems, resource problems, can be resolved if you set clear priorities and you follow those priorities. I believe that States have the ability to do that.

Mr. ROE. If the gentleman would yield.

Mr. MOLINARI. I will be glad to yield, Mr. Chairman.

Mr. ROE. I let you go quite far afield and maybe it is because of the questions but if we are going to get into that, there is a great difference of opinion in this committee and the administration on that issue.

I mean I can't let some things go in the record unchallenged. Before we even got into the 1981 change of law, we were allocating, I believe, the figure was $3.6 billion a year that sticks in my mind or thereabouts for the grant-in-aid program.

Am I right on that figure? Wasn't it around that figure?

Mr. OBERSTAR. $6 billion.

Mr. ROE. So that what this administration has already done is to cutback at least $1 billion in eligible funding for the municipalities to carry out, their communities and regions to carry out their work. That is No. 1.

If the gentleman would yield further, that this definitely is a direct relationship from the quantitative dollars that are made available under the grants program as to what we are doing in this particular change of direction here.

How long have you been here; a year did I hear you say?

Mr. EIDSNESS. Approximately a year, sir.

Mr. ROE. The battle that was fought last time, and I didn't want to take the time this morning, but we have to do it to get the record straight, the battle that was fought the last time was based fundamentally upon the point of view of whether or not the Federal Government was going to provide what level of grants to the States to achieve the goals that were established by EPA, and by the law.

EPA was the one who approved the drawings, the plans, and the specifications in every single project throughout the country. That was their responsibility, and the funding that was made available was at least $3.4 billion or higher than that.

This administration came and cut those funds back to $2.4 billion. In the meantime what they had done, so you know the next time you testify; they, the administration and EPA had approved segmented contracts and partial contracts. They come to a project that could be $400 or $500 million. They come back and say, "We will approve the interceptors this year. I am not faulting this. We will approve the digesters next year. We can't give you all the money in one year and you, city or municipality, go ahead and build these plants or facilities."

That is what has happened to 10,000 projects, throughout this Nation, many of them left undone. The fact that the EPA has come back and the administration has cut those costs has seriously de-

layed the completion of regional sewage systems throughout this entire Nation. That, sir, is a matter of fact and on record 50 times both here and in the Senate.

Now when you are coming back and you are saying here what you are going to—why do we want to downgrade receiving waters? That is the question the gentleman has asked. That is what has been asked all morning. What is the point of it? If we are to improve the water supply and the water quality for this country, why is the EPA moving to provide a mechanism to downgrade the quality of those streams that are not yet polluted? Is that a fair question? Is that what the gentleman is trying to get at in part?

Mr. MOLINARI. I think that will lead me into the area of question that I have started out on, Mr. Chairman.

Mr. ROE. Can you answer that? Why should we create a mechanism to downgrade?

Mr. EIDSNESS. Sir, the EPA is not advocating or promoting downgrading of waters, but we clearly——

Mr. ROE. But that is what you just got done saying, sir. Either that or I am not hearing you.

Mr. EIDSNESS. No, sir. There has historically been a perception and a reality that there was a policy in EPA regulations to allow on a case-by-case basis, subject to EPA's review and approval, a State to downgrade a particular stream segment in terms of their standards and it was fairly carefully circumscribed.

The point I was making was that we have since found that that policy was not legal, and we are trying to introduce a policy that is legal, because there is a need and there is a statutory basis for such a policy under the Clean Water Act.

We are looking for suggestions. We have had 11 public meetings. We have 1,400 comments. I asked this committee what it thinks is an appropriate approach. If you want to argue the merits of whether or not we need a downgrading policy, I think that would probably be a good discussion as well.

Mr. ROE. That is precisely the point that this gentleman is trying to argue. I don't want to take the time.

Gentleman from New York.

Mr. MOLINARI. I guess I am more confused than I was before, Mr. Eidsness. Let me try to ask you a theoretical question. Assume that we have a reach of water which has been designated for industrial use. An industrial discharger is located on that body of water. The Clean Water Act water quality standards for that body of water are not being met. Under your proposed regulations, therefore, is it true that a cost-benefit analysis would be performed, and if it concluded that the cost of this industry complying could not result in attaining the standards that had been in place, then industry in that particular case would not be forced to spend the amounts of money that they were being required to under the Clean Water Act. Is that correct on my part?

Mr. SCHATZOW. I think if I can try, Congressman Molinari, to distinguish between what the existing use of the water is and the designated use in the State standard. Under the EPA proposals, all existing use of the water must be maintained. If a water now supports a warm water fishery——

Mr. MOLINARI. Does that in any way permit industry to increase the amount of pollutants as long as the standards are still being met?

Mr. SCHATZOW. The industry must meet all the technology-based requirements such as BCT and BAT. If the water quality in a particular stream were better than the minimum necessary to protect the use under this proposal, it would allow a State to increase the amount of pollution on that particular water body.

Mr. MOLINARI. That was my reading of it.

Mr. SCHATZOW. However, let me just try to make this clear. That can also be done under the existing regulations.

Mr. MOLINARI. Maybe there is a fault in the existing regulations, but that doesn't mean to me that we should perpetuate it in revised regulations. Should we not consider plugging the hole in existing regulations, if that is going to help to clean up the quality of our waters?

Mr. SCHATZOW. I think the problem that we were trying to deal with, in these proposed regulations, was in those areas where the States designated a water body for a particular use back in 1972, a use that is not now being attained and has not been attained in that particular water body.

In those situations where we are meeting the national technology standards, both for municipalities and for industry, but would not attain that use, nor is it being attained now, under what circumstances, and with what guidance could the States consider or reconsider the appropriate designation of that water body.

Now under the existing regulation, they are allowed to reconsider it, and under these regulations they would also be allowed to reconsider it. The question is, I think what caveats and what guidance would the EPA give to the States in making that consideration?

Mr. MOLINARI. I guess I know——

Mr. ROE. If the gentleman will yield, if you are saying that it is applicable and I think it is a germane point, in either one of the regulations, why are we changing the regulations?

Mr. SCHATZOW. There are a few specifics that I think Eric has mentioned in his testimony. One specific was in terms of the economic test. Under the existing regulations, were we to lower the designated use, the State would have to substantiate the fact that meeting that use would result in widespread social and economic harm. That test, many people including the States, believe to be a much too rigorous test.

Mr. ROE. Can the gentleman yield on that specific point, and this may help us clarify something. Just a few months ago we had hearings on the 301H section, on the waiver section of the discharge to ocean and tidal waters. Do you recall that issue? This was maybe three or four months ago.

Mr. EIDSNESS. I was here.

Mr. ROE. Then you understand what I am talking about. I recall that as we were debating that particular issue, tremendous concern arose. What methodology would EPA follow vis-a-vis the point of waivers. Do you recall that issue?

Mr. EIDSNESS. Yes, sir.

20-955 O—84——11

Mr. ROE. Immediately after that hearing, or just before it because of actions that had been taken, and I mean this with the greatest of respect, in the northern regional district of EPA there was a whole plethora of communities from Hudson County, and I speak now authoritatively, because it is my State, that felt they negated their regional system.

They virtually negated it. They had their bonding set. They had $140 million, they had floated the bonds on the whole, but they negated the entire thing and communities all along that river now are putting in for waivers. I do compliment EPA because I know you have been very strict and haven't granted those waivers as yet, but by the same token they said why should we be on the economic test, if we are going to be putting higher quality water into the Hudson River, vis-a-vis the tidal flow and the pollutants coming from New Jersey and New York, which was precisely the issue. Why should we spend the money to clean up the effluent that we are going to be putting into the Hudson River. That was specifically the issue.

Now we are coming back and saying here, as the gentleman, Mr. Schatzow, was saying, "Yes, if we change these regulations, and bear me out if I am right or wrong, that we would be able to, the streams where they were changed would be able to assimilate a higher level of bio-oxygen demand." Isn't that correct?

In other words, they would be able to accept more pollutants. Now the question that is before us is, do we want to go on that same course, when we are mightly concerned about the 301H section which has yet to be dealt with by this committee in depth when we get into that hearing. Or do we want to set another thing going where we are coming back and saying it is the economic test involved. I know in my own State, and I know in New York, New York City rebuffing when they should have to put in that other major plant that they were working on and going into secondary treatment.

Why should they do that now? They are saying we don't have enough money available to be able to do that secondary treatment. Now we can't sell the committee that if we start going down these relaxation routes that apparently this speaks to. We are not going to be helping to denigrate that system, and we are coming back and no longer saying it is fishable and swimmable waters we are looking for.

We are coming back and saying, "Well, we are only going to be able to do that which we can do with the amount of economic funds that are available." Is that a fair analysis to make?

Mr. EIDSNESS. I would like to respond to that, and I think I can clear up some of your concerns. I hope so, and I will try very hard.

One is that on the 301H waiver process, economics and cost are not considerations that EPA takes into account. We do not for statutory reasons, consider costs. The test that has to be met on a 301H waiver is that whatever level of treatment that EPA ultimately would agree to, must be sufficient to assure protection of balanced population of fish, shellfish, and wildlife in that receiving stream, and also meet water quality standards, if there is a State-adopted water quality standard.

Now as I understand it, from a legal interpretation point of view, if you meet the balance test of fish and wildlife in the 301H waiver, you have met the use under a State standard. However, State standard, under section 510 of the Clean Water Act, can also be even more stringent. I do not view that there is any relationship between 301H in terms of any opportunity for relaxation——

Mr. ROE. Nor did the gentleman from New Jersey say there was, but I know darn well what happened when EPA started in that direction. I don't know what your intent was, but I can tell you flat out that Hudson County canceled its entire regional bond issue, and 18 of those communities came in for a waiver under the system, and the whole program is now delayed again another 3 or 4 years. Now they are going to go into court and the whole bit.

The point I am trying to get at is if you go in that direction here, and you are making the economic test, you have a partial economic test in there now and they are coming back and saying it is going to cost an extra $400 million to do that job. Therefore we don't want to do this; that is what is concerning this committee because that is not want you meant to do.

That is precisely what has happened in New Jersey, so something has got to be wrong in between on part of that.

The gentleman from New York.

Mr. MOLINARI. I would like to pick up where you left off, Mr. Chairman. I happen to know that there are 31 applications for waivers in region 2, and those have been filed primarily by the States of New York and New Jersey, and by municipalities located in both of those States. Nobody, including EPA can tell us what the impact would be if all those waivers were granted.

As a matter of fact, they can't tell us what the impact will be if six were granted. My understanding is it is going to take at least 18 months before region 2 will be able to make a decision. In the meantime, what Mr. Roe is describing is what is happening—the municipalities that have filed their applications for waivers are sitting back and not spending any more dollars in proceeding to secondary treatment because they figure maybe the waivers are going to be granted. If this is true, in effect New York is hurting the environment and we are retarding the point at which at least some of them will be required to move forward and spend some more money and that has me deeply concerned.

I would like to pick up where I was before and ask: with the cutback in funding, how do we expect the cost-benefit analyses to be done? Who is going to finance it?

Mr. EIDSNESS. Congressman, the cost-benefit analysis, as I mentioned in my statement, is an optional consideration. Let me explain the origin of this. Most State standards are adopted by a body appointed by a Governor or legislature of lay people. They are part-time, nonprofessionals in the field, representing a cross-section of that particular community.

In other words, it is in effect a legislative body perhaps such as the Congress here in Washington. When anybody at this level—I hope you will agree—makes decisions. They are made in the context of what is it going to cost? and what are we going to get for that.

What we are simply suggesting is that rather than have that sort of faint thought process going on inside people's heads, that the State agency could, if they chose, develop more information on a structured basis and present that to the responsible decisionmaker or board appointed by the Governor or legislature.

There are a few States that don't have commissions or boards. New Jersey does not have one. I assume, all their regulatory policies are made by paid civil servants as opposed to appointed bodies. What we were trying to get at is to provide better structure and better information for that lay body to set State policies in water quality standards.

Mr. MOLINARI. Are you aware, Mr. Eidsness, about the monitoring of water quality in the New York-New Jersey region?

Mr. EIDSNESS. Not in any great detail, no, sir.

Mr. MOLINARI. Do you know who monitors it?

Mr. EIDSNESS. Well, I assume that the State pollution control agencies do. We fund them to do some of that, so if they are not we have a problem. Also, the discharges as a condition of their permit conditions have to monitor their effluents so we know whether or not they are meeting their requirements.

Mr. MOLINARI. What about the role of the Interstate Sanitation Commission?

Mr. EIDSNESS. I am not familiar with that group, sir, but I hope that they are doing some, because that is where we need to spend some of our effort, getting some of this data together.

Mr. MOLINARI. I have and I would like to introduce into the record, Mr. Chairman, four yearly statements and they are entitled, "Percent of Time Interstate Sanitation Commission Dissolved Oxygen Requirements Were Met at ISC Remote Automatic Water Quality Monitoring Stations." The earliest covers the period of October 1, 1977, through September 30 of 1978. The others cover the three years following that.

[The material referred to follows:]

Cong. Millinni. Info.

PERCENT OF TIME INTERSTATE SANITATION COMMISSION DISSOLVED OXYGEN REQUIREMENTS WERE MET AT I.S.C. REMOTE AUTOMATIC WATER QUALITY MONITORING STATIONS FOR THE PERIOD OF OCTOBER 1, 1980 THROUGH SEPTEMBER 30, 1981

MONTH	STATION 1 AK/CE	STATION 2 ER/CE	STATION 3 ER/TN	STATION 7 KVK/USG
October 1980	79.6	100.0	100.0	100.0

September 1978	24.2	59.9	72.1	-	-	86.2

Mr. MOLINARI. If you take a look at the figures, I believe that you will find shocking the percent of time that indeed the standards were met.

For instance, we see that during the summer months when there is a particular problem, the percentages drop sharply. And now I have learned that the Interstate Sanitation Commission, due to a cutback in funding, is going to cut their monitoring in half, and I say to myself good God, who in the world is going to really look at the water quality? We have a hepatitis outbreak in this area. It is unexplained. Nobody has been able to say what is accountable for that outbreak of hepatitis.

However, we do know that we have had serious problems with contamination of clams, and of course the suspicion is that it is caused by the pollution of the water. With the raw sewage that we have abounding in the waters surrounding New York, I would guess that it is no great wonder why this occurs. Nevertheless, here is a body that we look to, and it has a good reputation; ISC. It is a tristate commission; and yet they are telling us that with the cutback in funding, only half of the monitoring that they did before is going to be accomplished today. So when we take all these things into consideration, what Mr. Roe said about your waivers and what-not, I wonder in what direction we are heading.

I am very much concerned. If I read these correctly, and I apologize because I didn't have enough opportunity to study them, but from a quick perusal, I am somewhat convinced that we are heading in a direction opposite to the one in which we should be going. I hope to God when I finish making my study that I am wrong in that assessment, because EPA has come under a lot of fire in the last month or so, and I don't think we need to continue that course here. I certainly don't want to suggest that that is a conclusion on my part, but it is certainly a concern on my part.

We have a serious problem in our area. I am sure it is not unique to our area, and I would like, Mr. Chairman, to get an idea as to when there is going to be a second part to this hearing. I am wondering if you can give this gentleman an idea as to when it is so I can be better prepared the next time around.

Mr. ROE. We are obviously not going to be able to conclude your part of the hearing today because a host of members have other questions and there are two or three hearings going on at the same time which is not your fault, so I would think what we will do is hear from a couple more of our members and then recess this session, and then we will call Mr. Eidsness and Mr. Schatzow back again after we have had a chance to do so.

Mr. MOLINARI. Under those circumstances, I will cease my questions.

Mr. ROE. Mr. Weber.

Mr. WEBER. As a new member I am looking to an educational process so I won't take a whole lot of time, but I am interested in one aspect of the regulations and maybe it was discussed before I was here. As I understand it, the reason for the minimal standards, or one of the reasons in all of our laws, is to try to prevent the kind of competition among the States that might lead the pollution becoming an economic development tool, if you will. For example,

we see States, particularly in the Northeast and Midwest, in very dire financial straits, including my State of Minnesota.

I am not familiar with your proposals to the extent that some of the other members of the committee are, but I just wonder if you can try and explain to me how the proposed changes in regulations might affect the ability of States to use water quality standards as a tool to compete for industry. The source of my concern relates to the fact that some States are increasingly unable—at least in the short term—to compete economically through changes in the tax law, because they have incredible revenue needs. I know in such cases they are looking for every other opportunity they can find to compete and that competition is becoming very fierce.

Will your changes in regulations affect that? Will they result in the creation of "pollution havens"?

Mr. EIDSNESS. That is an excellent question, sir. I will try to make my answer as brief as possible on this.

I think that the opportunity for States changing standards which would have the effect of attracting industry are almost nil. For one reason, I don't believe States are going to modify their standards, downgrade them as people say they will under our proposals. I think they will continue to have good strong effective standards as a regulatory tool. Regardless of what a State might do with its standards, an industry must meet the national technology requirements. Under these technology based requirements, the percent removal of pollutants may be somewhere from 73 to 90 percent.

If it is a new source, a new discharge, the requirements are more stringent than those of existing sources. In some cases, our regulations for national technology standards for industry require zero discharge. You can't get more stringent that that, so I really don't believe that there is going to be a problem.

Also industry representatives have stated that, the cost of pollution control is not a significant issue as compared to all of the other issues that they take into account in deciding where to locate. Transportation centers, job market availability, local infrastructure; whether they have a nice environment for their own employees, communications, transportation are as important, I really believe it is more of an academic issue.

Mr. MOLINARI. Would the gentleman yield?

Mr. WEBER. I will be glad to yield to my colleague.

Mr. MOLINARI. That question was asked before and I understand your answer.

Mr. EIDSNESS. Yes, sir.

Mr. MOLINARI. The question comes to my mind, what would prevent a corporation that wants to take advantage of an advantageous economic situation, from buying the stock of a corporation, which owns an existing source? You are talking about new sources, and I understand that, but how about going in and buying an older building someplace, where it would not be a new source. Simply buying a stock in the corporation, it is going to be called the same name and there is no patent change as far as the public is concerned.

Mr. EIDSNESS. Yes, sir, they are still regulated by the HPDES discharge permit system, and that permit would require that they meet national technology-based standards. If they wanted to in-

crease their flow and buy an old factory, that industry would have to get a Federal permit or a State permit as the case may be. The permit would be based on the national uniform technology-based requirements.

Mr. MOLINARI. Would the technology be different?

Mr. EIDSNESS. No; it would be the same for that industry category. It if was iron and steel it would be the same. If it was textiles, it would be the same.

Mr. MOLINARI. Excuse me, but wouldn't one be a new source and have stricter requirements than the existing source?

Mr. EIDSNESS. I am sorry, sir. What was the question?

Mr. MOLINARI. The new source; building from the beginning, a new source; am I not right in assuming that the standards would be stricter than somebody who would be buying an existing structure somewhere?

Mr. EIDSNESS. Not in all cases, but generally.

Steve, do you want to respond to that? He set the effluent guidlines here.

Mr. MOLINARI. My counsel back here keeps saying yes, yes to the answer, and I have a lot of confidence in him.

Mr. SCHATZOW. Any source would have to meet best available technology requirements. A new source would have to meet new source performance standards, or an existing source that substantially modified and expanded its production.

Mr. MOLINARI. Stricter than existing, that is the point I am getting at.

Mr. EIDSNESS. They are in some cases stricter. In some cases they are not. It depends. The statutory tests are somewhat different for existing sources than new sources. In some areas, in some industrial processes, where for instance the cost of retrofit might be prohibitive for an existing source the standards for new sources are more stringent, but I think one of the things I was saying to keep in mind, when we are talking about toxic removal, through BAT processes, we are talking in a range of over 90 percent removal. What we are talking about is that shading on the last 10 percent in terms of where a new source standard may actually be more stringent than an existing source standard. We are talking about that range.

The most significant costs are the costs that all facilities have to bear, and then there are some smaller incremental costs that might apply to new facilities.

Mr. EDGAR. Thank you. I have no more questions.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

As I have reviewed the proposed regulations, I personally applaud the effort to move more and more of the responsibility to the States, and I think most of the States, certainly my State, is taking a greater and greater responsibility in controlling the water quality.

I personally feel that the quality of the water is the primary issue, and as long as we set standards for it and the States are meeting those standards, how and who does it is not as important.

One of the concerns I have relates to the fact that I represent an area that is near the border of Mexico, an area where there are

rivers and the ocean. How do you address the situation in which there are no standards or weaker standards across the border with respect to rivers or ocean waters that effect U.S. waters?

Do your regulations take into account in any way the situation involving a border city that cannot meet the standards, simply because it doesn't have full control of the effluent that goes into the waters that affect them?

Mr. EIDSNESS. Congressman Packard, that is an excellent question. I have to say that is the first time I ever heard that question. It is a very interesting one you pose.

Mr. PACKARD. The Tijuana River is a case in point.

Mr. EIDSNESS. I agree.

Mr. PACKARD. Tijuana dumps into the Tijuana River but so do some of the border cities that are in and around my district. If you run your tests on that water, there is no way those border cities in the United States could meet the qualifications.

Mr. EIDSNESS. There are two issues that are presented. One is, does the EPA water quality standards regulations and whatever the States subsequently adopt as their own regulations under our guidance allow your community on the U.S. side to somehow take into account that no matter how much they clean up they are not going to be able to do very much because of pollution from across the borders.

I think the answer to that is basically no, because once again national technology standards have to be met. Your municipalities would still have to meet secondary treatment no matter what our regulation does here; but probably more important, this is a critical international issue.

In the case of Canadians, for example, we have an agreement with them, an International Joint Commission, to jointly coordinate and regulate pollutants going into the Great Lakes. We also have an agreement with the Government of Mexico on salinity as you are probably well aware, but I don't know that we have any agreement specifically dealing with the issue you mentioned, but I would be very happy to look into this.

Mr. WEBER. Would the gentleman yield? Isn't this the same issue that we have with the Canadians on air quality, which is not resolved? I don't expect that that is necessarily your area, but isn't that a controversy that we have with the Canadians over how we regulate emissions from smokestack industry?

Mr. EIDSNESS. Yes; there is a controversy. I wish the Canadians were doing as good as we were, although they accuse us, I think unjustly, of not doing our job over here on this side of the line. We do have water agreements which are very effective with the Canadians. I might add that the whole basis for the agreement on the Great Lakes, is water quality based, just as we are talking about here. It has been very, very effective; and the accomplishments achieved in the last 10 years in cleaning up phosphorus-lead products has just been phenomenal.

Mr. WEBER. I thank the gentleman for yielding.

Mr. PACKARD. I think further research ought to involve the outflow going into the oceans because, obviously, the currents will affect the effluent. There should be testing of the water all up and down the southern California beach, to just right at the border.

One other question. As you turn more and more responsibility of water quality over to the States through revising your regulations, if a specific State does not meet those qualifications, what kind of sanctions or requirements are built into your approach?

Mr. EIDSNESS. Under the act if the State has adopted a standard, under their own rulemaking procedures that does not meet the requirements of the act, EPA has an overriding authority and must theoretically within 90 days promulgate its own standard. EPA has exercised this authority in the past and I would expect we would do so in the future in the case of a State that modifies a standard that we cannot accept as meeting the intent of the law.

Mr. PACKARD. Thank you. I have no further questions.

Mr. ROE. Thank you.

What we are going to do, because we have another hearing coming up this afternoon, is recess this hearing at the call of the Chair, and then coordinate with you so you can return, because there are a number of other members who have dual hearings and they couldn't be here and they wanted to ask additional questions.

I want to thank you very much for being with us this morning. As you can see, there is a great, considerable interest and a lot of learning perhaps both ways to go, so we do appreciate your patience and your indulgence and we look forward to seeing you back at our next hearing.

The gentleman from Minnesota.

Mr. STANGELAND. I would just ask unanimous consent that I might be allowed to submit a series of written questions to Mr. Eidsness for the record. I would also request that all committee members be allowed that privilege.

Mr. ROE. There is no objection. It is so ordered.

[The questions posed and the responses received from Mr. Eidsness follow:]

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

OFFICE OF
THE ADMINISTRATOR

Honorable Arlan Stangeland
U.S. House of Representatives
Washington, D.C. 20515

Dear Mr. Stangeland:

Enclosed are the Agency's responses to thirteen questions you submitted following the Water Resources Subcommittee's Water Quality Standards hearing on February 23, 1983.

Thank you for the opportunity to respond to these questions. If we can provide any additional information or respond to further questions, please do not hesitate to contact me.

Sincerely yours,

Leland E. Modesitt, Jr.
Director
Office of Legislation

Enclosure

cc: Mr. Joseph A. Italiano

1. I BELIEVE THAT MOST STATES WOULD AGREE THAT EXISTING DATA ARE OFTEN -- AND MANY WOULD SAY USUALLY -- INADEQUATE TO MAKE VALID USE ATTAINABILITY DETERMINATIONS. GIVEN THE FACT THAT NECESSARY STUDIES ARE QUITE EXPENSIVE, HOW CAN ANYONE BE SURE THAT THERE WILL BE ADEQUATE FUNDING TO PERFORM THIS WORK, ESPECALLY IN LIGHT OF THE MAJOR BUDGET CUTS THAT HAVE BEEN PROPOSED IN FY 84 FOR BOTH STATE GRANT ASSISTANCE AND EPA'S WATER QUALITY PROGRAM? WHO WILL DO THESE STUDIES AND ANALYSES AND WITH WHAT FUNDING?

A. According to the most recent information submitted by States under section 305(b) of the Clean Water Act, the vast majority of our nation's streams meet the fishable, swimmable goals. A relatively few streams are water quality limited and therefore possible candidates for review as to the appropriateness of water quality standards.

EPA in its FY 1983 and 84 Operating Guidance requested States to establish priority water bodies as a basis for ranking which streams will receive attention with respect to use attainability analysis and water quality standards reviews. Setting priorities is a basic management tool and a necessary step for States to make the best of limited resources in managing for environmental results. We encourage States to identify priority water bodies--that is, water bodies for which pollution abatement and control decisions are most needed to prevent or reverse the impairment of a designated use--and to organize State efforts to focus on these waterbodies. Grants under section 205(j) of the Clean Water Act are negotiated on the basis of these priority water bodies to assure that adequate funds are dedicated to conducting analysis related to water quality standards revisions.

Resides applying priorities, EPA is also strongly encouraging States to develop local cooperative monitoring programs as another way to obtain maximum benefit from limited resources. We encourage States to involve local groups, dischargers, and other federal agencies in cooperative monitoring programs to implement the water quality based approach. Of course, we and the States will insist on adequate quality control procedures, and States will have the responsibility to interpret the data.

Additional resources for water quality program related work were also made available through Section 205 (j) of the 1981 Construction Grants Amendments. This section set aside one percent (1%) of a State's construction grant allotment for a variety of water quality planning purposes. Although our data are still preliminary, States indicate that they plan to use this money for detailed reviews of their water quality standards, and to conduct the type of scientific and technical analyses we recommend.

Based on the work plans EPA has received from 15 States for use of the Section 205(j) grant funds authorized in FY 1982 and 1983, the majority of the $45 million to be obligated this year will be related to site specific analyses associated with treatment reviews and water quality standards reviews. This $45 million, along with the $24 million available for Section 205(j) in FY 1984, will provide States with substantially greater resources for water quality standards and related monitoring work than in 1982, when about $6 million of Section 106 grants were used for these purposes.

Overall State grant obligations[1]/ for activites traditionally funded by Section 106 grants will increase from a $50-53 million level in FY 1980-1982 to $107 million level in FY 1983 and decrease to $56 million in FY 1984. Because FY 1983 Section 205(j) grants have not yet been awarded, actual expenditures against those grants will occur in FY 1983, 1984 and possibly 1985. This will result in a leveling out of expenditures by States for traditional Section 106 activities in FY 1983 and 1984 to a level of between $73 and 78 million.

In addition, States will have in FY 1984 approximately $207 million in Section 205(g) funds. Since States have been encouraged to reserve up to three years 205(g) funds to complete the the construction grants program, a maximum of $25 million of this reserve (in eleven States with more than three years reserve) could be used in FY 1984 for 106 activities.

In order to evaluate the procedures for conducting use attainability analyses and deriving site specific criteria, EPA conducted nineteen site specific criteria case studies (see Figure 1) and nine use attainability studies (see Figure 2). These case studies were jointly developed between EPA and the State water quality agencies. Based on their experience with the EPA procedures for deriving site specific criteria, the WQS Subcommittee of Iowa's Department of Environmental Quality proposed that criteria modification should be adopted as a normal part of the States water quality standards review and revision process.

An important feature of EPA's use attainability and criteria modification procedures is the transferability of data and information. Once a State has conducted such analyses on their priority streams, the resulting information can be applied to other streams with similar physical and chemical characteristics. EPA's guidance proposes that States "group" water bodies with similar characteristics to facilitate more cost effective use of data. As States gain experience in generating data and in transferring data to other water bodies, the cost of doing the analyses will be reduced dramatically.

1/These include all section 106 and 205(j) obligations as well as expected section 205(g) obligations except those for construction grant management activities.

Finally, the use and application of the use attainability and criteria modification procedures are at the discretion of the States. In accordance with the 1981 amendments to the Title II Construction Grant Program, States must identify and review their standards for stream segments that may require treatment greater than secondary treatment. For such standards reviews, States may use the criteria modification and use attainability analyses. Whenever appropriate, EPA will provide technical assistance and support for such analyses.

A costing study has been conducted by EPA with three States to determine the resource needs of initiatives dealing with conducting use attainability studies and developing site-specific criteria. For use attainability studies on simple segments the average range of costs is $4,200-$7,400 depending on the amount of available scientific data base. For use attainability studies on complex segments the range of costs is $5,760-$9,800 depending on the adequacy of the scientific data base. The resource implication of site-specific criteria modification is dependent on the number of water quality parameters evaluated. For a one chemical constituent, the criteria modification average cost is $18,275 which includes conducting acute bioassays. For two constituents the average cost would be $37,100.

20-955 O—84——12

Figure 1: Site-Specific Criteria Development
(Field Testing)

Region	State	Site	Source	Pollutants	Acute Toxicity Water Effect Ratio
I	Connecticut	Norwalk River	wire manufacturer	Pb,Zn	Zinc=1.8 Lead=4.1

Figure 2: WATER BODY SURVEYS AND ASSESSMENTS GUIDANCE CASE STUDIES

REGION	SITE	PURPOSE OF STUDY	INITIAL SITE VISIT	WORKPLAN COMPLETE	FIELD WORK	STATE ASSESSMENT AND REPORT	FINAL REPORT TO EPA	COMMENTS
Region I	Assabet River, Massachusetts	Site calls for full fishery with a D.O. of 5; however, a lower level of aquatic protection seems more appropriate.	5/12-13	5/20	No field work	9/15	10/4	Completed.
Region II	Cuckels Brook, New Jersey	Effects of 1 municipal discharger and 1 industry on aquatic protection use	5/6-7	not applicable	Field work end of August	12/15	2/15	Completed.
Region III	Blackwater River, Franklin, VA	Comparison of least disturbed control to sites with one secondary treatment plant and one paper-pulp industry to evaluate potential aquatic use	4/20	4/26/82	early June and mid-Aug.	10/14	10/30	Completed.
Region IV	Deep Creek, North Carolina	Appropriateness of D.O. limits and AWT for Scotland Neck Plant	6/1-2	6/11	Completed by 7/15	8/16	10/15	Completed.
Region V	South Fork of Crow River, Minn.	Classified as warm water fishery; suspected limited warm water fishery	6/14-15	6/19	no field work	9/30	10/15	Completed.
Region VI	Pecan Bayou, Brownwood, Texas	Water body misclassified due to hydrological/low flow problem due to inadequate dam release	5/6-7	5/14	no field work	7/15	10/15	Completed.
Region VII	Salt Creek, Lincoln, Nebraska	Classified limited warmwater fishery; suspected full warmwater	5/3-6	5/12	no field work	6/31 to Regional Office	7/5	Completed.
Region VIII	South Platte River Colorado	Applicability of guidance document	5/4-5	5/14	no field work	July	10/14	Completed.
Region IX	---	----------	---	---	-----	---	---	Region [illegible] not recommend any sit[illegible] or this project
Region X	Malheur River Oregon	Stream classified as salmonid and non salmonid; State feels that it can only be a warm water fishery	4/26-29	not applicable	no field work necessary	8/15	early October	Completed.

2. THERE HAS BEEN CONCERN THAT INDUSTRIES MAY "SHOP" FOR POLLUTION HAVENS IF WATER QUALITY STANDARDS ARE PERMITTED TO VARY TOO MUCH. WOULD YOU DISCUSS HOW NEW SOURCE PERFORMANCE STANDARDS FIT IN AND IF THEY MAY PRECLUDE THIS? ALSO, WOULD YOU PROVIDE FOR THE RECORD HOW NEW SOURCE PERFORMANCE STANDARDS COMPARE SPECIFICALLY WITH BPT, BCT, AND BAT REQUIREMENTS?

A. There are two degrees of regulatory requirements included in the Clean Water Act (CWA). Congress designed a partnership between EPA and the states in carrying out the requirements within the CWA by having EPA develop a ' ensure a minimum level of treatment nationwide, and having the states responsible for establishing water quality standards and implementing the water quality based approach. The mechanism provided to enforce all pollution control standards is to require dischargers to obtain a permit.

The technology based standards set uniform national requirements by specific industrial categories based upon explicit considerations of cost and available or demonstrated technology. These standards may vary from industry to industry and between municipal systems; however, they result in mass or concentration base limitations which in gross terms control, on a technology basis, greater than ninety percent of the pollutants. These technical requirements are embodied in federal regulations and further, they are incorporated into permits controlling the discharges from all direct dischargers. Where these technology based controls are inadequate to meet water quality standards, additional treatment of the pollutants, based upon explicit consideration of water quality, can be applied. Under the CWA (Section 303), states adopt water quality standards to define the uses to be made of water and the criteria to protect the uses. These standards are also intended to reflect specific local conditions and priorities such as site-specific physical, chemical, and biological characteristics of the receiving stream and to assure that the "use" is attained. The water quality based approach applies to the relatively few segments that will not meet water quality standards after installation of the technology based controls.

For most of the industries, existing dischargers must meet technology based control requirements for greater than ninety percent of their pollutant discharges regardless of location, while others must meet more stringent water quality limiting requirements. Many of the issued standards require existing dischargers to reduce the quantity of discharge (flow), thus significantly reducing the mass of pollutants when meeting the best available control technology (BAT) requirements. The New Source Performance Standards (NSPS) represent the best demonstrated control technologies for each of the industries. In many cases the higher removals of pollutants in NSPS over BAT result from the ability of new plants to effect greater efficiencies in water use, in addition to using more efficient process and pollution control equipment without retrofit problems.

Six of the eleven industrial categories for which NSPS standards were recently promulgated require more stringent controls than the discharge standards that have been established for existing plants, including, in some cases, zero discharge to surface waters. The remaining 5 categories have promulgated NSPS equal to BAT discharge standards where existing plant technologies have already been found to achieve the higher levels of pollution control that are normally associated with NSPS standards.

NSPS is applicable to any new source constructed after publication of the proposed standards. A new source is defined as a new plant construction (a greenfield plant) or major changes in processes, pollutants, or volumes of waste flow at an existing facility using certain criteria to determine if the modification constitutes enough of a difference to be considered a new source.

With respect to concerns that industries may tend to "shop" for pollution havens where water quality standards vary, we believe that it will be unlikely for the following reasons:

° all new plants and most major modifications at existing facilities would have to comply with national NSPS standards -- these NSPS discharge standards may be as stringent or more stringent than what water quality standards would require;

° the decision to relocate may be more costly in meeting NSPS discharge standards (i.e., due to labor costs, taxes, transportation costs, occupational skills training, etc.) compared to the cost required for upgrading the equipment at an existing plant in order to meet the water quality standards;

° all existing plants must be achieving BAT/BCT discharge standards by 1984/85 no matter where the plant is located or exists; if water quality standards require stricter control, and the industry wants to move, it must compare the cost of meeting national NSPS standards with either the BAT/BCT and/or the water quality standards; and

° for cases where BAT or BCT = NSPS, the industry would have to consider the balance of the incremental cost of installing new equipment to meet stricter water quality standards over the total impact and cost of moving.

3. HOW AND WHY DID EPA COME UP WITH THE "PRESUMPTIVE APPLICABILITY" TEST AT THE TIME IT WAS DEVELOPED? WHAT MAKES IT LESS APPROPRIATE TODAY?

A. On January 16, 1978, the Director of the Criteria and Standards Division announced the presumptive applicability policy in a memo to all regional offices. On July 10, 1978, in the Advance Notice on Proposed Rulemaking on water quality standards, EPA included a description of the policy of presumptive applicability and the supporting rationale. No public comment nor State input was sought. The policy was simply initiated by the Agency. On November 28, 1980 (45 FR 79318), EPA rescinded that policy "... because it has proven to be too inflexible in actual practice."

EPA developed the policy to provide guidance on two issues: (1) the use of the Agency's Quality Criteria for Water (Red Book) in water quality standards and (2) the nature of the criteria to be promulgated when a State water quality standard is disapproved. However, EPA never provided the necessary supporting guidance to the States and the Agency rarely acceded to a State's request to develop a criterion different from the Agency's recommendation.

The proposed policy of site-specific criteria development provides both policy and technical guidance to the States as well as providing the States a clear option to either use EPA's national recommendations or develop alternative criteria.

EPA develops national criteria recommendations as guidance to the States under Section 304(a)(1) of the Clean Water Act. Under Section 304(a)(1), these water quality criteria are based solely on data and scientific judgements on the relationship between pollutant concentrations and environmental and human health effects. Criteria values do not reflect considerations of economic or technological feasibility.

The Section 304(a) laboratory-derived criteria may not accurately reflect the toxicity of a pollutant because of the effect of local water quality characteristics or varying sensitivities of local aquatic communities. In other cases, adaptive processes may enable a viable, balanced aquatic community to exist in water with high natural background levels of certain pollutants. Similarly, certain compounds may be more or less toxic in some waters because of differences in temperature, hardness, and other parameters. Developing site-specific criteria is a method of taking local conditions into account. This determination ensures that criteria will be adequate to protect the designated use and that they will not be more stringent than needed.

There are water bodies that support the designated uses even though the Section 304(a) numerical criteria included in the State's standard are exceeded. EPA believes that if, after surveying the water body, States determine that the water conditions are acceptable for the use even though the criteria exceeded, States should be able to modify the criteria.

We are able today to provide States with scientific procedures to develop site-specific criteria - this knowledge simply was not available when the presumptive applicability policy was announced.

4. REGARDING "PRESUMPTIVE APPLICABILITY", I AM AWARE THAT NEW JERSEY IS IN FAVOR OF RETAINING IT. WHAT IS THE POSITION OF OTHER STATES AND THE ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS REGARDING PRESUMPTIVE APPLICABILITY? HOW MANY BELIEVE IT HAS OUTLIVED ITS USEFULNESS?

A. New Jersey and Maine are the only two States who support retaining the presumptive applicability policy, however, both States also support the concept of site-specific criteria development.

Other States expressed a number of concerns with the policy proposal allowing the development of site-specific criteria, but even though offering criticisms, concerns, and technical comments on the concept, they stopped short of advocating a return to the presumptive applicability policy.

5. ON PAGE 10 OF YOUR STATEMENT, YOU MENTION THAT ALL 57 STATES AND THE JURISDICTIONS HAVE APPROVED WATER QUALITY STANDARDS, FOR THE RECORD, WOULD YOU PLEASE PROVIDE THE COMMITTEE WITH A COMPLETE STATE-BY-STATE BREAKDOWN OF THOSE WATER QUALITY STANDARDS THAT ARE CURRENTLY IN EFFECT?

A. Each of the 57 jurisdictions included in the national water quality standards program adopts standards by following their own administrative and legal procedures. Therefore, all States present their standards in different formats. We have available for public review in our offices all approved State water quality standards. The committee or committee staff is welcome to review those documents. My staff will assist in any way possible.

In 1980 we compiled a series of reports on the various standards adopted by the States. [redacted]. Of course, there have been various types of revisions to State standards since that time. For example, New Mexico made several changes in the use classifications assigned to the Rio San Jose, New Jersey amended its antidegradation policy and Indiana revised several water quality criteria affecting the Grand Calumet.

6. ON PAGE 7 OF YOUR STATEMENT, THE FOLLOWING CLAIM IS MADE:

"THE WATER QUALITY BASED APPROACH APPLIES TO THE RELATIVELY FEW SEGMENTS THAT WILL NOT MEET WATER QUALITY STANDARDS AFTER INSTALLATION OF THE TECHNOLOGY BASED CONTROLS"

WOULD YOU INDICATE TO THE SUBCOMMITTEE HOW MANY OF THESE SEGMENTS WE MAY BE TALKING ABOUT? WHAT PERCENTAGE OF THE TOTAL IS THIS? WHERE ARE THESE WATER QUALITY LIMITED SEGMENTS, BY STATE AND LOCATION WITHIN EACH STATE?

A. Preliminary EPA staff estimates indicate that 10 percent or less of the waters in the U.S. fall into this category; however, it is difficult to give an exact estimate of the number of water quality limited segments. Part of the reason for this difficulty is that, although States generally completed lists of such waters in their earlier water quality management plans, they were done at a time when much less was known about toxic pollutants. Furthermore, the definitions of some technology-based controls such as BAT are just now becoming available and the lists are generally undergoing continual revision.

In addition to our preliminary estimates, 20 States, in their 1982 305(b) reports, provided estimates of the waters presently meeting the fishable, swimmable goal of the Clean Water Act. These estimates from the States range from a low of 66 percent of Rhode Island's 329 assessed stream miles to a high of 97 percent of New Hampshire's 14,500 stream miles. While it should be noted that no precise national conclusions about the percent of waters meeting the 1983 goal can be drawn because of varying methods of assessing goal attainment, these estimates do indicate that a majority of the Nation's waters already meet the 1983 goal. Hence, a relatively small proportion will require additional water quality-based controls after technology controls are in place.

7. HOW DO BEST MANAGEMENT PRACTICES TO CONTROL NONPOINT SOURCES OF POLLUTION RELATE TO THE WATER QUALITY STANDARDS SETTING PROCESS?

A. The Nationwide Urban Runoff Program (NURP) is in the process of writing its final report. Our general conclusion that is emerging is that impacts, or actual impairment to use, is a function of duration and frequency of the pollution event. The duration of the runoff, or pollution event, is critical. Less than 90 percent of events in this country last less than 16 hours. Half of all events last less than 6 hours. Study results indicate that fish can tolerate higher concentrations of pollutants for short periods of time. Not only are the durations short, but occur frequently. On an annual basis it rains less than 8 percent of the time.

One of the products of the NURP program is a screening methodology which uses those 2 factors, duration and frequency, to predict effects on use and the result of the use of controls. States will be able to use this screening methodology to make initial determinations as to whether or not nonpoint sources, hydrologically related pollution events, are significant factors with respect to attaining standards and if so, necessitate further site-specific studies to determine the extent of degradation and appropriate control.

One of the basic provisions of our proposal is that States may not modify or reclassify a designated use if the "use will be attained by implementing cost-effective and reasonable best management practices for nonpoint source controls."

Information generated by a State relating to the impact of BMP's in meeting water quality standards may be used in a number of different ways. The data may be used to demonstrate that the adopted standards are appropriate as are the prescribed BMP's. The data may also show that either the standards are unattainable for the water body or the BMP's are not appropriate, in which case, either may be changed. Our proposal, however, does not force States to adopt mandatory nonpoint source controls in place of voluntary arrangements.

8. DO YOU HAVE ANY INFORMATION ON THE NUMBER OF STATES THAT WERE FORCED TO DEVELOP STANDARDS WITH INSUFFICIENT DATA AND ANALYSIS?

A. In 1972, the law expanded the coverage of water quality standards to include intrastate as well as interstate waters. The States had only 180 days to adopt intrastate standards and submit them to EPA for review and approval. Given the short time frame involved, and the limited availability of water quality data existing at that time, States generally adopted "fishable/swimmable" standards with little or no consideration of the feasibility of a water body to support such standards. Since that time, States have been reviewing their standards and making revisions including changes in both criteria and use designations.

9. EVEN THOUGH EPA FORMALLY RESCINDED THE POLICY OF PRESUMPTIVE APPLICABILITY IN NOVEMBER, 1980, ASIWPCA HAS STATED THAT THE POLICY HAS BECOME INSTITUTIONALIZED IN THE EPA REGIONS, IS STILL APPLIED, AND SHOULD BE CLARIFIED AS IN EPA'S PROPOSED REGULATIONS. WOULD YOU AGREE WITH THIS ASSESSMENT?

A. The presumptive applicability policy was rescinded in November 1980. However, the requirement still exists for States to adopt criteria appropriate to protect designated uses. Such criteria must be based on sound scientific analysis, and are subject to EPA review and approval after formal adoption by the State. The problem lies in EPA providing adequate scientific and technical guidance to a State that establishes acceptable means for a State to develop criteria on a site-specific basis without precluding the use of existing or innovative State techniques which may be equally as scientifically and technically acceptable as EPA's guidance. The guidance and regulation also must recognize that a State may choose to adopt EPA's national recommendations or to develop and adopt alternative criteria. We believe our proposed guidance and regulation do recognize these issues and is sufficiently detailed yet flexible enough for the State's use. One element of presumptive applicability will always survive - any criteria designed to protect a specifc use must be developed on a sound scientific basis.

10. DO YOU HAVE ANY INFORMATION ON THE NUMBER OF STATES THAT HAVE DIFFICULTY WITH REVIEWING ALL THEIR STANDARDS ON A THREE YEAR CYCLE? HOW DETAILED ARE THESE THREE YEAR REVIEWS?

A. If the question means an in-depth analyses of all their standards, virtually no State has claimed they can do that within 3 years. There is no single answer to how detailed current 3-year reviews are. The level of detail varies greatly given the number of States, the difference in administration of the program, and the priority assigned in a State. The concept of reviewing the standards in detail on priority water bodies is supported widely by the States. Periodically, a State will undertake a major revamping of their standards, a process which took Colorado eight years to complete.

11. YOU NOTED THE INVOLVEMENT OF ASIWPCA IN THE PROPOSED REGULATIONS STARTING ON OCTOBER 1980. DIDN'T THE WORK ON THIS RULEMAKING ACTUALLY BEGIN IN JULY, 1978? COULD YOU BRIEFLY OUTLINE THE MAJOR STEPS IN THE PROCESS OF ISSUING PROPOSED REGULATIONS?

A. On July 10, 1978, the Agency published an Advance Notice of Proposed Rulemaking for public comment. The Agency then analyzed the public comments and in 1979 and 1980 began developing a series of issue/option papers on major policy initiatives and a draft strategy for the future course of the water quality standards program. The availability of this material was announced to the public in the Federal Register (45 F.R. 77780, November 24, 1980).

Starting in October 1980 we worked closely with the ASIWPCA Subcommittee on Water Quality Standards in developing several drafts of the proposal which was eventually published in October 1982. These various drafts were also widely distributed to the States and others. In that two year period, we actively sought opportunities to discuss our ideas with environmental, business, and industry groups.

After publication, of course, we had 11 public meetings with over 900 attendees and have received over 1,400 written comments.

12. YOU NOTE THAT THE IMPLEMENTATION OF TECHNOLOGY BASED CONTROLS HAS, "IMPROVED THE QUALITY OF MANY OF THE NATION"S RIVERS AND STREAMS." ARE THESE IMPROVEMENTS REFLECTED IN CURRENTLY DESIGNATED USES OR PRESENT WATER QUALITY STANDARDS? IF NOT, DO YOUR PROPOSED REGULATIONS PROVIDE GUIDANCE TO THE STATES FOR ADDING USES OR UPGRADING WATER QUALITY STANDARDS?

A. In many cases technology-based controls has resulted in meeting established water quality standards, thus no State action relative to their standards is needed. States are continually reviewing and revising their water quality standards to reflect both the latest scientific knowledge available as to the effects of various pollutants and to reflect water quality improvements. We believe our proposed regulation and the accompanying supporting guidance does provide sufficient guidance and direction to the States to add or upgrade water quality standards. The policies with respect to use attainability analysis, site-specific criteria development, and benefit-cost assessments, provide adequate information to support either an upgrading or downgrading decision. As the State of California noted in their official comments, they support the concept of a uniform test for making standards more or less stringent.

13. DOESN'T YOUR "BENEFIT-COST ASSESSMENT" REALLY AMOUNT TO AN ECONOMIC REASONABLENESS STANDARD SIMILAR TO, BUT MORE FLEXIBLE THAN, THAT EMBODIED IN THE CURRENT REGULATIONS AND DESCRIBED IN SECTION 302(B) OF THE ACT?

A. Yes. We believe that the current economic test is unworkable and perhaps unrealistic. We are looking for an alternative, preferably one that was used elsewhere in the Act. Although used in a different context, Section 302 does require balancing of economic and social costs and economic and social benefits.

The controversy over the inclusion of a benefit-cost assessment in our proposed regulation centered primarily on three issues, namely: (1) that a cost-benefit ratio would be the basis of a standards decision, (2) that a benefit-cost assessment is a requirement in adopting a revising standards, and (3) that we were proposing a typical water resource project classical type analyses. None of these are what we had in mind.

We envision a structured though common sense type process that provides State decision makers and the public with information on impacts - the environmental and economic gains and the costs of the standards decision. We see this analyses as an option available to the States and flexible enough to cover a variety of situations.

There are alternative ways of describing these economic impacts. Perhaps a test of economic reasonableness, as is currently in use in some States, may be more appropriate. Another possibility is an economic impact anaysis.

Mr. ROE. The committee will stand recessed to the call of the Chair. We will meet again this afternoon in joint committee at 2 o'clock.

[Whereupon, at 12:05 p.m., the subcommittee adjourned subject to the call of the Chair.]

ADDITION TO THE RECORD

Statement of
The Minnesota Pollution Control Agency
1935 West County Road B-2
Roseville, Minnesota 55113

Before the
Subcommittee On Water Resources
Committee On Public Works and Transportation
U. S. House Of Representatives

April 6, 1983

Mr. Chairman and members of the Subcommittee, I am Sandra Gardebring, Director for the Minnesota Pollution Control Agency. It is a pleasure to be here today. I appreciate the opportunity to relay to you Minnesota's position with regard to the U. S. Environmental Protection Agency's (EPA) proposed Water Quality Standards Regulation.

The Minnesota Pollution Control Agency (MPCA) was created in 1967 by the State Legislature. It consists of a nine-member citizen Board, whose members are appointed by the Governor, and an Executive Director, also appointed by the Governor, plus a staff of 325 people. The Agency Board is the decision-making body. The MPCA has been given broad authority by the Minnesota Legislature to control pollution and establish standards relative to water, air and solid and hazardous wastes. The MPCA administers the programs mandated by federal pollution laws such as the National Pollutant Discharge Elimination System (NPDES) permit program of the Clean Water Act.

It is no secret that Minnesota is blessed with abundant water resources of high quality. Our car license plates have for years proclaimed Minnesota to be the land of 10,000 lakes. In fact we have over 12,000 lakes 10 acres or larger. Minnesota is

also in the enviable position of being "upstream" of most of our neighboring states and provinces. Three major watersheds have their headwaters within our borders - the Mississippi, the St. Lawrence, and the Red-Rainy which drains to Hudson Bay. We have an obligation to our neighbors to protect the quality of the water leaving our state. In addition, we are the stewards for waters of national importance, such as the many lakes and rivers in the Boundary Waters Canoe Area and Voyageurs National Park, Lake Superior and the cascading rivers along its north shore, and the St. Croix River, a national scenic and recreational river.

Minnesota has a very high stake in its water resources and literally cannot afford to allow its waters to become polluted. Tourism, much of it water oriented, is a two billion dollar plus industry in Minnesota. Tourism is our third largest employer and it generates over 150 million dollars in revenue for the state each year. Thus, the MPCA has taken an active interest in EPA's proposed Water Quality Standards Regulation. The MPCA has submitted written comments to EPA Office of Water Regulations and Standards in the form of three letters which are attached to this statement.

I would like to start by stating our general reaction to the proposed Regulation and follow that with some specific comments and examples of how we anticipate the Regulation will impact our water quality programs.

In the final analysis the MPCA opposes the proposed Regulation because it will not improve our ability to conduct our

water quality programs and, to the contrary, it could be a hindrance.

1. It could place impossible burdens on the human and monetary resources of the MPCA.

2. It appears to offer states greater flexibility but, in reality, it may be more restrictive than the current Regulation.

3. It has the potential to promote water quality standards "shopping" by industries looking for the best deal in the current atmosphere of intense competition between states for jobs and business.

4. It relys heavily on benefit-cost analyses, an area that should be left entirely to the discretion of the states; and,

5. Most importantly, it is a Regulation that appears to reflect a philosophy of opposition to real environmental protection.

I will now expand on some of these points.

First of all, the issue of increased demands on state resources.

The use attainability surveys, criteria modification bioassays, and benefit-cost analyses suggested by the proposed Regulation are typically very labor intensive and costly activities. If such surveys and studies are going to be useful, they will have to be of sufficient detail and duration to add new

information to what is intuitively known, or what can be surmised from regional data. Cursory studies are not likely to help decision makers and may be misleading.

While the site specific studies themselves can add a substantial burden to state resources, it is the site by site rule making process EPA suggests should follow these studies that is of much greater concern to the MPCA. In Minnesota the administrative rule making process requires at least a year to develop new water quality standards. If site specific standards had to be promulgated for even a few of the communities in the construction grants program, long delays would be encountered in moving communities through the program. The possibility of losing grant funds becomes very real.

The EPA response to the resource issue is to have states concentrate their efforts on only their priority waters. Minnesota, out of necessity, has always concentrated its resources on priority waters. I doubt that Minnesota is unique among the states in this regard. For EPA to suggest to us now that we can absorb the additional burden of extra site specific studies <u>and</u> site specific rule making by prioritizing our waters is naive at best.

It is the position of the MPCA that site specific modifications, when warranted, can be accomplished through the NPDES permit process within the framework of state-wide water quality standards without the need for site specific rule making. In fact, we have used this process successfully in Minnesota. In several situations involving water quality limited discharges

(i.e., where effluent limitations are controlled by downstream water quality standards as opposed to an effluent limited discharge where minimum technology such as secondary treatment defines the limitations), site specific criteria have been developed for the receiving waters under the authority of our current state-wide water quality rules. The modified criteria then became the basis for the limitations incorporated into the NPDES permit. The required 30-day public notice period for permits provides an opportunity for public input into the process. Thus, the MPCA feels that the permit process is the most cost effective and expeditious way to accommodate legitimate site specific concerns and factors which can alter local water quality criteria and, subsequently, the effluent limitations.

In a practical sense, some aspects of the proposed Regulation are already required of states as part of the justification of advanced waste treatment (AT) projects. Site specific surveys are needed to justify the funding of advanced treatment facilities. When AT studies are done, the same studies also should meet the requirements of the Water Quality Standards Regulation. States cannot afford to conduct duplicate studies to satisfy slightly differing requirements of these two complementary programs. The MPCA would like to see better coordination and cooperation between the AT review and Criteria and Standards staffs at EPA.

20-955 O—84——13

To summarize MPCA's position with regard to the potential for extra burdens on state resources, we feel that this would be greatly reduced if:

1. The site specific modifications are accomplished through the NPDES permit process and not through site specific rulemaking, and
2. One set of site specific studies satisfies both the AT and Water Quality Standards Regulation requirements.

The second issue is the claim of greater flexibility.

The proposed Regulation purports to offer states greater flexibility in the management of their water quality programs. At the same time EPA retains the authority to approve or disapprove AT projects and water quality standards revisions. Presumably much of the flexibility will be exercised when states decide where site specific studies are needed and how detailed they should be. The proposed Regulation allows substantial latitude in the scope and type of study. It is left up to the states to anticipate the appropriate level of detail that will satisfy the EPA review process. The MPCA is concerned that real flexibility will be stifled because states will feel obligated to do studies where they are not needed, or do studies in greater detail than necessary to be sure they satisfy the undefined EPA requirements. There may be substantial pressure on states to over do or "pad" the studies in order to gain approval for their AT projects and standards revisions.

Real or not, a potential byproduct of the touted flexibility may be the use of water quality standards as bargaining chips by states in the intense competetion for jobs and businesses. This is most likely to occur in situations where effluents are limited by downstream water quality standards. A state could relax local water quality standards under the guise of site specific studies to the point where beneficial uses are no longer protected but where they would be attractive to a courted industry. We hope that this scenario does not come true, but the proposed Regulation appears to make it more likely.

Thirdly, I want to make a few comments on the major provisions in the proposed Regulation.

A. Use Attainability Surveys

The proposed Regulation implies that states can benefit from doing use attainability studies on all waters. The uses of many of Minnesota's waters are not in question - fishing and recreational uses are being achieved. No use attainability survey is needed on these waters. The question that should be emphasized is to what degree is the point source discharger limiting downstream uses.

A demonstration use attainability survey, done by the MPCA at EPA's invitation, illustrates these points. The survey was on the South Fork of the Crow River, a stream in south-central Minnesota draining an agricultural watershed. This river is presently classified for use as a warmwater fishery. The purpose of the study was to determine if this was the appropriate use classification for the river. Only

available fisheries, water quality, and physical data were used in the assessment. No additional data were collected. After reviewing these data and writing the report, a process that took about four man-months, it was concluded that the warmwater fisheries classification was indeed correct. The important point here is that this was known before the study began. The basic conclusions of the study, that the present classification was correct and that the water quality was impaired below the discharger, was known to the MPCA staff before the study started. While the report contains various fisheries and water quality indicies and comparisons of the South Fork to the North Fork of the Crow River, all of which are on interest, the study added essentially nothing beyond what was already known concerning the use classification and the need to upgrade the point source discharger. The MCPA feels that such studies are justified only where beneficial uses are truely in doubt or where there is a need to carefully document the impact of a discharger on downstream uses.

B. Site Specific Criteria Modification

The MPCA recognizes that a water quality criterion or standard valid for one set of conditions may not be valid for another. As previously stated, the MPCA has used criteria modification techniques to develop effluent limitations in several water quality limited situations. But this was accomplished through the NPDES permit process and did not require site specific rulemaking.

C. Benefit-Cost Analyses

The MPCA feels that the need for economic analyses should be left to the discretion of the states. The proposed Regulation is very vague about what projects will require a benefit-cost analysis. In the absence of such guidance, states are very likely to feel obligated to do some sort of benefit-cost study on all projects or face the loss of federal grant funds for their projects. In an apparent effort to soften the impact on state resources, the EPA guidance suggests that the smaller projects may need only a simplified descriptive study. However, the MPCA feels that the EPA is misguided in believing such studies will contribute valuable information to those who must decide the fate of AT projects. The tools are available to do meaningful economic studies but the required data are seldom available. The acquisition of such data is expensive and its interpretation requires staff trained in applied economics. Thus, economic studies that will add information of real value are only feasible for the largest and most expensive projects.

We have been told by David Sabock of EPA's Criteria Branch, Office of Water Regulations and Standards, that this part of the proposed Regulation and guidance document will undergo extensive revision. Therefore, I will not comment further on the original version here.

For the record, our full comments are contained in the letter dated January 17, 1983 attached to this statement.

D. Antidegradation

The MPCA completely rejects the proposed antidegradation policy. The suggested approach provides no more protection to outstanding waters than is provided by the enforcement of water quality standards, and it is, therefore, superfluous. An antidegradation policy should provide extra protection to waters recognized for their very special or unique qualities. To allow the degradation of high quality waters down to the level of water quality standards, as the proposed policy would do, is likely to destroy the very character that makes these waters unique. We have been informed that the comments received by EPA on the antidegradation proposal were overwhelmingly negative, and that EPA will replace it with a much stronger version - one similar to the antidegradation statement in the current Regulation. The MPCA welcomes this change.

In conclusion, it is the position of the Minnesota Pollution Control Agency that:

1. A new Regulation is not necessary to accomplish site specific modifications to water quality standards and to accommodate economic concerns, but if there is to be a new Regulation;

2. It should allow site specific modifications to be accomplished through the NPDES permit process,

3. It should accept a single set of site specific studies for both the advanced treatment and water quality standards requirements,

4. It should not require use attainability surveys on rivers and streams whose beneficial uses are not in doubt.

5. It should include a much stronger antidegradation statement and encourage states to identify their very high quality waters; and

6. EPA should reassess the value of descriptive benefit-cost analyses, and they should greatly clearify their expectations of states in the whole area of economic analysis.

Mr. Chairman, this completes my statement. I would be happy to answer any questions that you or members of the Subcommittee have.

Minnesota Pollution Control Agency

FEB 08 1983

Mr. David K. Sabock, Chief
Criteria Branch
Office of Water Regulations and Standards
United States Environmental Protection Agency
401 N. Street SW
Washington, D.C. 20460

Dear Mr. Sabock:

The Minnesota Pollution Control Agency (MPCA) is submitting its final comments on the proposed Water Quality Standards Regulation (40 CFR Parts 120 and 35) noticed in the October 29, 1982 Federal Register. The MPCA believes that the regulation, as currently proposed, is fundamentally deficient in the following respects:

1. While offering the illusion of state flexibility, in reality it potentially could be far more restrictive than the existing regulation.

2. It runs the risk of setting state against state in the water quality standard development process.

3. It depends heavily on the tool of benefit-cost analysis, which is an aspect of the standards setting process properly left entirely to the discretion of the states.

4. It will require the inefficient and excessive use of limited state monetary and human resources.

5. Most importantly, it is a regulation which, at its core, appears to reflect a philosophy of opposition to real environmental protection.

Thus, the MPCA opposes the proposed regulation, but would find it more acceptable if changes were made which address the following specific concerns.

Equal Opportunity Employer

1. Demand on State Resources

The work suggested for use attainability, site specific criteria modification and benefit-cost studies are labor intensive and can involve expensive surveys, bioassays, and other data gathering and analytical tasks. The U.S. Envionmental Protection Agency (USEPA) response that states should focus on a priority list of waters to minimize the impact on state resources is logical but does not solve the resource problem especially if site specific water quality standards are to be the end result of these studies. The rule making process in Minnesota takes at least a year to enact new standards. Minnesota has completed construction of many of its larger wastewater treatment plants, and now has on its construction grants priority list a large number of small projects. If a large number of these projects require the promulgation of site specific standards before effluent limitations can be finalized in the NPDES permit, significant administrative delays will be encountered. The subsequent loss of grant funds becomes a very real possibility. States should be allowed to adjust water quality standards and effluent limitations on a site specific basis as part of the NPDES permit process. The permit provides an opportunity for public input into the process. The MPCA has successfully used this approach in Minnesota within the framework of its state-wide standards.

The MPCA will continue to conduct use attainability surveys for Limited Resource Value Waters and do other site specific studies as required to justify advanced treatment (AT) projects. To make the most efficient use of the resources committed to these studies, the results should satisfy both the requirements of the proposed water quality standards regulation and the AT justification program. States can ill afford to duplicate their efforts to satisfy slightly differing requirements for these two programs.

2. Undefined Scope of Suggested Studies

The flexibility offered by the proposed regulation, although generally sought by the states, can have disadvantages. The use attainability, site specific criteria modification, and benefit-cost analysis offer a broad spectrum of optional approaches ranging from very cursory to very detailed and costly studies. The state is placed in the position of having to guess what level of effort is appropriate in each case. It will be too easy for the USEPA in their review of water quality standards and AT projects to conclude that more effort is required in some portion of the project. This may cause states to conduct more extensive studies than they feel necessary, at greater expense, to avoid these review process pitfalls.

A related concern is that the proposed regulation does not recognize that the beneficial uses being made of many waters are not in question. The implication is that states can profit from conducting use attainability

studies on all waters. In situations where fishing and recreational uses are obviously being attained, as is the case of many of Minnesota's rivers and streams, no use attainability study should be required or expected.

3. Complexity of Meaningful Studies

There is an underlying assumption in the proposed regulation that site specific studies - whether biological, physical, chemical, or economic - are always going to yield the correct site specific standards and effluent limitations so that treatment costs will not exceed what is needed to meet standards. There is a danger that the USEPA is expecting more from these studies than is realistic. For example, biological data often have very large confidence limits or margins for error. Even assuming surveys are conducted during a "normal" or representative year, sampling errors can result in effluent limitations that are still too stringent or too lenient. The need for seasonal limitations only compounds the problem. Also, the accurate definition of significantly different standards for streams of similar characteristics in similar watersheds is very unlikely. The results of surveys on one stream should be transferrable to similar streams.

4. Antidegradation

The antidegradation policy proposed by the USEPA (section 131.10 (C)) and described as option 1 is not an antidegradation policy at all in the opinion of the MPCA. By placing the emphasis on use, the proposed antidegradation provision confers no more protection to high quality waters than is already provided by the maintenance of water quality standards. This level of protection is already provided in the proposed section 131.10(j)(1). The concept of antidegradation implies the judicious application of extra protection to very high quality waters or waters of a special or unique quality such that their quality will not be significantly altered. For many high quality waters a large part of their attraction as a recreational resource is their pristine quality. Furthermore, waters specifically identified because of their special or unique qualities, such as very clear headwater lakes, might lose all their attraction if allowed to be "degraded" to the level of the standards. Antidegradation policies should be applied sparingly and preferably to specifically identified waters. Thus the MPCA not only endorses the adoption of antidegradation option 2, but urges the USEPA to encourage states to designate outstanding state waters which will receive antidegradation protection.

In summary the proposed regulation is unlikely to improve the MPCA's water quality programs since the MPCA is applying site specific concepts to its water quality standards and effluent limitation programs already. On the contrary, the regulation in its present form could be a hindrance to existing pollution control efforts. The MPCA urges the USEPA to make changes in the regulation to reflect the following specific recommendations:

1. The promulgation of site specific standards through rule making should not be required to implement the results of site specific studies. States should be able to accomplish site specific alterations in the water quality standards and effluent limitations through their permitting processes within the framework of state-wide standards.

2. Site specific studies should satisfy the needs of both the water quality standards program and AT justifications.

3. No use attainability study should be required for waters where fisheries and recreational uses are obviously being achieved.

4. The USEPA should adopt the antidegradation policy in option 2 with the addition of a statement encouraging states to identify their very high quality waters.

5. It is important for the USEPA to recognize that the benefit-cost analyses and biological surveys usually require detailed studies before meaningful information is attained. Conversely, cursory studies will add little or nothing to what is intuitively known, and may be misleading.

Sincerely,

Sandra S. Gardebring
Executive Director

Minnesota Pollution Control Agency

January 17, 1983

Mr. David K. Sabock, Chief
Criteria Branch
Office of Water Regulations and Standards
United States Environmental Protection Agency
401 M. Street SW
Washington, D.C. 20460

Dear Mr. Sabock:

The Minnesota Pollution Control Agency (MPCA) has commented in the past on proposed changes to the Water Quality Standards Regulation (40 CFR Parts 120 and 35), and accompanying guidances. However, because the cost-benefit guidance has only recently become available for review, comments regarding this aspect of the proposed rule change have not been submitted. We wish to comment specifically on the benefit-cost assessment guidance, now published as Chapter 4 of United States Environmental Protection Agency (USEPA), Office of Water Regulation and Standards, Water Quality Standards Handbook, Draft, October, 1982, and its application, at this time.

The first comment to be made is that the guidance lacks clarity. The proposed rule states that "if feasible [water pollution] controls are available, a benefit-cost assessment may be made to determine if it is worth requiring more stringent effluent limitations than those in Section 301(b)(1) and (2) of the Act." (Federal Register, Vol. 47, No. 210, Friday, October 29, 1982, p. 49244.) Such analyses are optional. However, there is an overriding concern on the part of states that federal funds may be withheld for combined sewer overflow (CSO) and advanced treatment (AT) projects until a benefit-cost assessment is completed. States, for the most part, do not have economic programs or staff in place to do such assessments. There is little or no existing data to utilize. For the purpose of planning, it is crucial for states to clearly understand the expectations of EPA with regard to

Phone: 612/296-7202
1935 West County Road B2, Roseville, Minnesota 55113-2785
Regional Offices • Duluth Brainerd Detroit Lakes Marshall Rochester
Equal Opportunity Employer

the number of cost-benefit assessments to be performed and their level of detail. It was the expectation of the State of Minnesota that the guidance would provide that information. This guidance, however, does not.

The guidance considers the right questions; however, the answers are most often vague or describe a full range of possibilities. The guidance seems to state that a benefit-cost assessment is appropriate in almost any situation and the level of detail can range from very simple to very complex. The guidance suggests that each assessment should be tailored to the particular site and submitted to EPA for review. This "wait and see" policy makes it impossible for states to plan how they can address their water quality problems in a timely manner.

The second comment to be made is that this state finds EPA to be misguided in its belief that a benefit-cost assessment will necessarily contribute additional valuable information to decisions regarding AT or CSO projects. While cost-benefit analyses can provide useful information to decision-makers, it is only under the most stringent conditions that this is true. Otherwise, the analyses are at best redundant, and at worst, entirely misleading.

Applied economics has developed the capability of estimating, within a reasonable degree of accuracy, the impacts of water quality improvements. An analysis of this nature regards costs as opportunity costs, estimates benefits as surpluses measured by areas under appropriate demand curves, and evaluates welfare implications by changes in the distribution of income. Such a study is useful to decision-makers beyond that which is intuitively clear to individuals familiar with the project.

Given perhaps $40,000 and a year's time, an economist schooled in applied economics could collect the necessary data and perform an analysis of the economic impacts of water quality improvements at a single site. (The above cost estimate does not include the economist's salary.) Minnesota has between six and sixteen projects possibly requiring AT reviews on their 1983 fiscal year project list. It is clear that Minnesota does not have the resources to perform an analysis of the nature described above for each of these AT reviews.

The guidance states that not all projects require an extensive benefit-cost analysis such as that described above. However, it is these less rigorous types of analyses which are fraught

with pitfalls. The guidance states in "simple, clear-cut" cases, the analysis may be descriptive (Chapter 4, table 4-1, Water Quality Standards Handbook, Draft, October, 1982). In these situations, cost-benefit assessments will itemize the costs of the project in dollar terms and itemize the benefits in terms of "visitor days, miles of pristine shoreline, increased clarity". Such descriptive analysis cannot improve decisions because it does not provide additional information. Information of this nature is known to the regulator; it is contained in current AT reviews and is discussed in public hearings. A descriptive benefit-cost assessment in such cases is at best redundant. It is a needless expense to states.

Descriptive cost-benefit assessments can be misleading. For example, several years ago, Minnesota farmers embarked upon a vigorous program of draining wetlands for agricultural production. The incremental costs of the program - construction costs, plus the loss of a few acres of waterfowl habitat, appeared negligible compared to the benefits of a farmer's lifetime of increased production. It is now known that vast acres of a unique irreplaceable resource, which provided wildlife habitat, ground water recharge, and water pollution control, were lost. The increased agricultural production in some periods did not benefit the individual farmer because increased production lead to reduced prices. However, benefits may have accrued to consumers of agricultural products. In other periods, subsidies have been paid to farmers to support prices or keep land out of production, thereby increasing the cost of government.

In the example above, it is doubtful that the numerous secondary effects of the program would have been considered significant - if they had been detected at all - in a qualitative study. While it is difficult to state the outcome of a more rigorous economic analysis, it is quite likely to have measured grain price effects and the value of the loss of recreational benefits. One such study, which monetized the benefits of wetlands with respect to waterfowl habitat, concluded that the benefits were of a magnitude to indicate that existing permanent wetlands should not be drained for agricultural use (Hammack, Judd and Gardner Mallard Brown, Jr., Waterfowl and Wetlands: Toward Bioeconomic Analysis, Resources for the Future, Inc., Baltimore and London, 1974, p.87). The point to be made is that we are skeptical that a descriptive benefit-cost assessment of the type described in the guidance can properly weight relative costs and benefits. The decision-maker will weight benefits described in narrative terms based upon his preconceived notions, and is mislead to

believe the analysis confirms those notions. It is only by the monetization of benefits can benefits and costs be correctly weighted and subsequently compared.

Cost-benefit analysis, which appears to be so valuable in public decisions, has yet to be successfully incorporated into the process. The reasons for this have been discussed above. A rigorous monetization of the benefits and comparison of the present value of opportunity costs and benefits, as well as an evaluation of the distributional effects of projects, requires far too many resources to be performed on a routine basis. A descriptive analysis only reiterates what is already believed to be true, and is redundant and possibly misleading. With respect to the issue at hand, if EPA expects a large number of benefit-cost assessments for justification of wastewater treatment projects, it will force states to do meaningless analyses which cannot contribute to decisions. This is additional and needless expense which states can ill afford.

The State of Minnesota urges EPA to encourage thoughtful cost-benefit analyses by states. These analyses should use the best empirical techniques of applied economics. When submitted to EPA for project justification, it is desirable that they be considered along with other technical information. Because of the resources required to perform such analyses, it cannot be expected that they will be performed except for a few of the nation's most expensive projects. Also, because of resource constraints, the decision to do the analysis should always rest with the state.

The State of Minnesota urges EPA to re-evaluate the value of descriptive analyses such as described in the guidance. As stated above, such analyses cannot improve the decision making process, and may in fact be detrimental to it.

Finally, the State of Minnesota urges EPA to clarify the guidance. The issues have been properly identified. However, EPA should squarely face the questions they have raised in the guidance and provide unambiguous answers for states, so that they may plan accordingly.

Sincerely,

Barry C. Schade

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, AUGUST 2, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 10 a.m., in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

The Subcommittee on Water Resources is meeting this morning to continue our hearings and receive testimony on Possible Amendments to the Federal Water Pollution Control Act.

Today's hearing is the continuation of a number of hearings we intend to hold in order to receive a wide range of views and recommendations on this matter.

The Federal Water Pollution Control Act is one of the most important environmental laws we have. It is designed to restore and maintain the quality of our Nation's waters through a comprehensive scheme of regulation and grants for the construction of publicly owned treatment works.

The law, by and large, has worked well, though we have got a great deal more to do. We have seen notable improvements in the quality of many of our waters.

Any amendments to the act must be considered with great care. It is important that nothing be done which will weaken the environmental protection afforded by this law and the progress that we have made.

This is not to say, however, that we should preclude the consideration of amendments which will make it work more effectively which, of course, is our function.

We will start off our hearings with witnesses chosen to present various points of view on the need for amendments to the Federal Water Pollution Control Act.

At future hearings, we will hear from a large number of other witnesses. This will enable us to determine just what, if any, amendments to the act are necessary and appropriate.

I want to thank you for participating this morning and certainly our colleagues that are here. We have a great deal to do. There is a great deal of interest in this particular legislation and in my judgment it is perhaps the most important piece of legislation that we

20-955 O—84——14

have to consider now, taking into consideration the vital import of the quality of the water supplies of the people of our Nation.

That is the spirit and the direction in which we intend to go in our deliberative in-depth hearings.

Before I call our first distinguished witness, I would like to refer now to our ranking minority member, the Honorable Arlan Stangeland from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

I want to join you in welcoming all of the witnesses who will testify on an issue of great importance to each and every American, the issue of maintaining and improving the quality of the waters of the United States.

The Federal Water Pollution Control Act, commonly known now as the Clean Water Act, continues to be a valuable tool for insuring that this Nation will always have an abundant source of clean water for all purposes.

This act has been basically sound environmental legislation for over 10 years. Nonetheless, we should always consider any legislation that will improve the purposes of this act. For instance, significant changes were made in 1981 to title II, the construction grants program.

Among other things this year, some of the funding provisions of the Clean Water Act must be addressed. Section 106, the State grants provision, and section 314, the clean lakes program, are examples of funding provisions that expired last September.

Such provisions need to be reviewed and considered for continued funding. Other major issues that deserve full consideration this year include compliance dates, pretreatment, nonpoint sources, and permits, among others.

Today, and in subsequent hearings, we will be hearing suggestions for changes that can be made to improve the Clean Water Act. In many cases I am sure we will hear arguments to not change parts of the act.

In any case, the goal must be a viable piece of legislation that is tailored to meet the needs of today and the future.

Mr. Chairman, I look forward to hearing from our witnesses today. I hope that upon consideration of their views we will be able to craft this legislation so as to continue the Nation's efforts to maintain and improve the quality of our rivers and lakes.

Thank you.

Mr. ROE. I thank the distinguished gentleman from Minnesota. We have the honor of having with us this morning the chairman of our full committee, the Honorable Jim Howard.

The CHAIRMAN. Thank you very much, Chairman Roe.

I will be brief, but I wanted to be here this morning to congratulate you and the members of this subcommittee for the work that you are doing.

During the latter part of the last Congress, where we had been spending so much time in legislation concerning transportation, highways, bridges, tunnels, mass transit, improvement in the highway trust fund, I was very often asked about the Public Works and Transportation Committee and what it would be involved in during the 98th Congress. I stated at that time that I believed that in this

Congress the Public Works and Transportation Committee would be basically the Water Committee.

Water improvement, water purity, water project reform—this subcommittee had been working through the entire last Congress on the major water resources bill that will be before the full committee tomorrow. I just want to congratulate you and the members of the subcommittee for all of the many, many hours of work that you have done in trying to assure a better environment for all the people in our country. Despite the fact that you have this major resource development bill that you have worked on for so long coming before the full committee tomorrow, which you passed out last week, you have taken the time now and will be immediately after the recess, on the Clean Water Act, another major piece of legislation.

I think that our committee will be very, very proud of what we have done for the future of our country in terms of water quality and related matters.

I just want to wish you Godspeed. We are all looking forward to later this fall and having presented to the full committee another fine piece of water legislation.

I just want to thank you for the time and effort you and the chairman and ranking member and members of your subcommittee are spending on this vital issue to the people of the United States.

Thank you very much.

Mr. ROE. Well, we certainly do appreciate the generosity of your statements, Mr. Chairman.

We are going to move in that direction to see that this bill is a quality piece of legislation.

We have with us our first witness this morning, the Honorable Roy Dyson of the State of Maryland, who has been a leader in the Congress in advocacy for water resources development and clean water programs. He has been in the forefront of developing thoughts and ideas and directions in this legislation and others that will be extremely important, not only to his State, but to the Nation.

We certainly welcome his input and participation in the many things he has been able to do to help this whole water resources program move ahead.

Mr. Dyson, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF CONGRESSMAN ROY DYSON

Mr. Chairman and distinguished members of the Subcommittee, I am here today to testify on behalf of H.R. 2817, a bill I introduced earlier this year that would amend the Clean Water Act to provide for the enhanced water quality of the Chesapeake and Narrangansett Bays.

The Chesapeake Bay is one of our nation's most cherished and valuable natural resources. It is the largest and most productive estuary in the contiguous United States, with a drainage area of nearly 64,000 square miles in size, that includes parts of 6 states and the District of Columbia. Its primary tributaries, the Susquehanna, the Potomac, and the James River, are major river systems in their own right.

The Bay's significance extends beyond its size, to its importance for the seafood, waterborne commerce and water-oriented industries that are vital to the middle Atlantic States. I am particularly aware of this because of my responsibilities as the

representative of Maryland's First Congressional District, which surrounds the largest portion of the Chesapeake Bay.

These local interests are complemented by the impact that the Bay has on the nation as a whole. Its fishing production is surpassed only by that in the Atlantic and Pacific Oceans, with an annual dockside value in excess of $100 million. Commercial shipping interests carried nearly 239 million tons of cargo via the Chesapeake in 1981, estimated at nearly $27.5 billion.

One of the Bay's most valuable roles is its function as a wildlife and aquatic habitat. Its tributaries are important places of reproduction for a variety of species of anadromous fish, like the shad and striped bass. In fact, almost 90 percent of the striped bass along the Atlantic Coast spawn in the Chesapeake's waters.

These facts indicate why the environmental quality of the Bay is so important to the region and the nation as you probably know, next month the Environmental Protection Agency completes its seven-year, $27 million study of the Chesapeake Bay's water quality. The study answers many of the most pressing questions about the condition of the Bay, but those answers only point to how much more remains to be done.

Research findings have identified three areas of serious concern: toxics, nutrient enrichment and declining Bay grasses. These findings indicate that the main stem of this 195-mile long estuary is losing oxygen. In addition, the upper reaches of the main tributaries are considerably more stressed than scientists orginally thought. All of these trends—the decline of the Bay grasses; the increased nutrient and attendant loss of oxygen; and the continued loading of toxic chemicals and heavy metals into Bay waters—portend serious problems by the end of the century.

The Bay grasses that once stretched from shore to shore are nearly gone. Commercial landings of striped bass plunged from five million pounds in 1973 to less than one million pounds in 1979. Shad, once harvested in huge numbers, are now so scarce that there is a rule against catching and keeping them in Maryland. In general, the fish that migrate each year to spawn in the Chesapeake Bay are disappearing.

This decline in water quality and subsequent loss of aquatic life has been principally the result of non-point source pollution; that is, agricultural and urban runoff, usually from heavy rainfall. Each year the Bay receives 400 million gallons of sewage and some 2,000 tons of metals and symbolic compounds, including sediments, fertilizers and herbicides.

Given the EPA findings, it is essential that we have a shared federal and state commitment to clean up the Chesapeake Bay. Management strategies for the Bay have been developed. A massive data base has been assembled to define trends in water quality variables and living resources over a 30 year time period for the Bay and its tributaries. There is only the need to establish a mechanism for implementing the Bay management strategies and to monitor their environmental results. I believe my legislation would provide that mechanism and the incentive for the states of Maryland, Pennsylvania and Virginia to develop and implement an interstate Bay Management Plan.

My legislation will provide a maximum of $10 million in federal funds in each of the next four fiscal years to help the states turn their water pollution reduction plan into action. The federal grant money, to be administrered by the EPA, will cover up to 55 percent of the total cost of implementing the plan in each state. Therefore, each state would have to contribute at least 45 percent.

The federal commitment to a healthier Chesapeake Bay must not end merely becasue the states are now the first line of defense against this water pollution problem. As the country's largest and most productive estuary, the Chesapeake Bay is as much a federal concern as a local one.

My bill also includes a $3 million authorization to insure that the EPA continues to conduct research and monitor changing conditions in the Bay. Special attention would be paid to the effect of pollutant loadings on the dwindling striped bass population.

Mr. Chairman, I am pleased to note today that my bill has received the support of the entire Maryland and Virginia Congressional delegations and over half of the members from Pennsylvania, three of whom are members of this subcommittee. In addition, the governors of Pennsylvania, Maryland and Virginia have all publicly endorsed the bill.

This high level of interest from Federal and State officials in the Chesapeake Bay region represents an unprecedented effort to deal with the Bay's problems. We have begun to recognize that there is a mutual interest among the needs of all parties in the region. Residents on the Bay worry about non-point source pollution harming the aquatic life. Farmers who live near the Bay or in the Susquehanna Valley are

concerned with finding ways to save money on fertilizer and improving their productivity by preventing further soil erosion. Problems such as these have too often been seen as being mutually exclusive and therefore incapable of a comprehensive solution. My bill initiates the kind of coordinated approach that begins the process of dealing with runoff and its harmful effect not only on the Chesapeake Bay, but on our farmland.

Finally, my legislation would provide $1.5 million in each of five fiscal years for the EPA to conduct research assessing the principal factors having an adverse effect on the environmental quality of the Narragansett Bay in Rhode Island. My bill also requires the Administrator of EPA to establish a mechanism for improving the collection, storage, analysis and dissemination of water quality data on the Narragansett Bay.

Mr. Chairman and fellow Colleagues, the Clean Water Act is our Nation's major legislative vehicle to improve water quality. The Chesapeake Bay, as our Nation's largest and most productive estuary, warrants protection under its statutes. My legislation represents an important first step towards improving the Bay's water quality and assuring future generations that the Chesapeake Bay will continue to be a productive center for economic development and aquatic life. I urge its inclusion in this year's reauthorization of the Clean Water Act. Thank you, Mr. Chairman. I would gladly answer any questions you may have.

A BILL

To amend the Federal Water Pollution Control Act to provide for the enhanced water quality of the Chesapeake and Narragansett Bays, and for other purposes.

1 *Be it enacted by the Senate and House of Representa-*
2 *tives of the United States of America in Congress assembled,*
3 That title I of the Federal Water Pollution Control Act is
4 amended by adding at the end thereof the following new sec-
5 tion:

1 "CHESAPEAKE AND NARRAGANSETT BAYS

2 "SEC. 117. (a) The Administrator shall, at the request
3 of the Governor of a State affected by the interstate manage-
4 ment plan developed pursuant to the Chesapeake Bay pro-
5 gram, make grants for the purpose of implementing the man-
6 agement mechanisms contained in such plan if such State
7 has, within one year after the date of enactment of this sec-
8 tion, approved and committed to implement all or substantial-
9 ly all aspects of such plan. The authority to make grants
10 under this section shall be subject to such amounts as may be
11 provided in advance in appropriation Acts.

12 "(b) Federal grants under subsection (a) of this section
13 shall not exceed 55 per centum of the costs of implementing
14 the interstate management plan in any year and shall not be
15 made to any State for any fiscal year when the expenditure of
16 non-Federal funds by such State is less than 45 per centum
17 of the costs of implementing the interstate management plan
18 during such fiscal year.

19 "(c) The Administrator shall continue the Chesapeake
20 Bay program to—

21 "(1) continue to assess the relationship between
22 point and nonpoint source pollution and the impact of
23 such pollution on water quality; and

1 "(2) do further research on the impact of pollutant
2 loadings on the fisheries resources of the bay, with spe-
3 cial attention given to the striped bass.
4 "(d) The Administrator shall immediately begin to
5 assess the principal factors having an adverse effect on the
6 environmental quality of the Narragansett Bay, as perceived
7 by both scientists and users, and, subsequent to a review of
8 presently ongoing research, to direct and coordinate research
9 and abatement programs that will most efficiently address
10 those factors. The Administrator shall also analyze all envi-
11 ronmental sampling data presently being collected on the
12 Narragansett Bay and suggest and undertake methods for
13 improving such data collection; establish a continuing capac-
14 ity for collecting, storing, analyzing, and disseminating such
15 data; institute a sampling program where deficiencies are
16 found to exist in present sampling programs; and determine
17 what units of government have management responsibility for
18 the environmental quality of the bay and define how such
19 management responsibility can best be structured so that
20 communication and coordination can be improved not only as
21 among the respective units of government but also among
22 those units, research and educational institutions, and groups
23 and individuals concerned with the environmental quality of
24 the bay.

1 "(e) There are hereby authorized to be appropriated the
2 following sums, to remain available until expended, to carry
3 out the purposes of this section:
4 "(1) $10,000,000 per fiscal year for the fiscal
5 years ending September 30, 1984, September 30,
6 1985, September 30, 1986, and September 30, 1987,
7 for grants to States under subsection (a);
8 "(2) $3,000,000 per fiscal year for the fiscal years
9 ending September 30, 1983, September 30, 1984, Sep-
10 tember 30, 1985, September 30, 1986, and September
11 30, 1987, to carry out subsection (c); and
12 "(3) $1,500,000 per fiscal year for the fiscal years
13 ending September 30, 1983, September 30, 1984, Sep-
14 tember 30, 1985, September 30, 1986, and September
15 30, 1987, to carry out subsection (d).".

○

Mr. ROE. Please proceed.

TESTIMONY OF HON. ROY DYSON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MARYLAND

Mr. DYSON. I want to thank you this morning, Mr. Chairman, not only for the time in these last few days before we go on our August recess, but also the times I have had the opportunity to speak to you in your office on something that is very important to me, as you know, the Chesapeake Bay.

I am here today again to thank you and other members of this distinguished subcommittee and to testify on H.R. 2817, a bill I introduced earlier this year that would amend the Clean Water Act to provide for the enhanced water quality of the Chesapeake and Narragansett Bays.

The Chesapeake Bay is one of our Nation's most cherished and valuable natural resources. It is the largest and most productive estuary in the contiguous United States, with a drainage area of nearly 64,000 square miles in size that includes parts of six States and the District of Columbia.

Its primary tributaries, the Susquehanna, the Potomac, and the James Rivers, are major river systems in their own right and we have a map up here that will indicate where the bay is, also provided by the Congressional Research Service. Very helpful.

It also shows the Outer Continental Shelf. I know that is not an issue today, but is part of that map.

Mr. ROE. It will be tomorrow.

Mr. DYSON. The bay's significance extends beyond its size to its importance for the seafood, waterborne commerce, and water-oriented industries that are vital to the Middle Atlantic States. I am particularly aware of this because of my responsibilities as the representative of Maryland's First Congressional District, which surrounds the largest portion of the Chesapeake Bay.

These local interests are complemented by the impact that the bay has on the Nation as a whole. Its fishing production is surpassed only by that in the Atlantic and Pacific Oceans, with an annual dockside value in excess of $100 million. Commercial shipping interests carried nearly 239 million tons of cargo via the Chesapeake in 1981, estimated at worth nearly $27.5 billion.

One of the bay's most valuable roles is its function as a wildlife and aquatic habitat. Its tributaries are important places of reproduction for a variety of species of anadromous fish, like the shad and striped bass.

In fact, almost 90 percent of the striped bass along the Atlantic coast spawn in the Chesapeake's waters.

These facts indicate why the environmental quality of the bay is so important to the region and the Nation.

As you probably know, next month the Environmental Protection Agency completes its 7-year, $27 million study of the Chesapeake Bay's water quality. The study answers many of the most pressing questions about the condition of the bay, but those answers only point to how much more remains to be done.

Research findings have identified three areas of serious concern: toxics, nutrient enrichment, and declining bay grasses. These find-

ings indicate that the main stem of this 195-mile-long estuary is losing oxygen.

In addition, the upper reaches of the main tributaries are considerably more stressed than scientists originally thought. All of these trends, the decline of the bay grasses, the increased nutrient and attendant loss of oxygen, and the continued loading of toxic chemicals and heavy metals into bay waters, portend serious problems by the end of the century.

The bay grasses that once stretched from shore to shore are nearly gone. Commercial landings of striped bass plunged from 5 million pounds in 1973 to less than 1 million pounds in 1979. Shad, once harvested in huge numbers, are now so scarce that there is a rule against catching and keeping them in Maryland. In general, the fish that migrate each year to spawn in the Chesapeake Bay are disappearing.

This decline in water quality and subsequent loss of aquatic life has been principally the result of nonpoint source pollution; that is, agricultural and urban runoff, usually from heavy rainfall.

Each year the bay receives 400 million gallons of sewage and some 2,000 tons of metals and symbolic compounds, including sediments, fertilizers, and herbicides.

Given the EPA findings, it is essential that we have a shared Federal and State commitment to clean up the Chesapeake Bay. Management strategies for the bay have been developed. A massive data base has been assembled to define trends in water quality variables and living resources over a 30-year time period for the bay and its tributaries.

There is only the need to establish a mechanism for implementing the bay management strategies and to monitor their environmental results. I believe my legislation would provide that mechanism and the incentive for the States of Maryland, Pennsylvania, and Virginia to develop and implement an interstate bay management plan.

My legislation will provide a maximum of $10 million in Federal funds in each of the next 4 fiscal years to help the States turn their water pollution reduction plan into action.

The Federal grant money, to be administered by the EPA, will cover up to 55 percent of the total cost of implementing the plan in each State. Therefore, each State would have to contribute at least 45 percent.

The Federal commitment to a healthier Chesapeake Bay must not end merely because the States are now the first line of defense against this water pollution problem.

As the country's largest and most productive estuary, the Chesapeake Bay is as much a Federal concern as a local one.

My bill also includes a $3 million authorization to insure that the EPA continues to conduct research and monitor changing conditions in the bay. Special attention would be paid to the effect of pollutant loadings on the dwindling striped bass population.

Mr. Chairman, I am pleased to note today that my bill has received the support of the entire Maryland and Virginia congressional delegations and over half of the Members from Pennsylvania, three of whom are members of this subcommittee, and I believe you have the full list in front of you.

In addition, the Governors of Pennsylvania, Maryland, and Virginia have all publicly endorsed the bill.

This high level of interest from Federal and State officials in the Chesapeake Bay region represents an unprecedented effort to deal with the bay's problems. We have begun to recognize that there is a mutual interest among the needs of all parties in the region.

Residents on the bay worry about nonpoint source pollution harming the aquatic life. Farmers who live near the bay or in the Susquehanna Valley are concerned with finding ways to save money on fertilizer and improving their productivity by preventing further soil erosion.

Problems such as these have too often been seen as being mutually exclusive and therefore incapable of a comprehensive solution.

My bill initiates the kind of coordinated approach that begins the process of dealing with runoff and its harmful effect not only on the Chesapeake Bay, but also on our farmland.

Finally, my legislation would provide $1.5 million in each of 5 fiscal years for the EPA to conduct research assessing the principal factors having an adverse effect on the environmental quality of the Narragansett Bay in Rhode Island.

My bill also requires the Administrator of EPA to establish a mechanism for improving the collection, storage, analysis and dissemination of water quality data on the Narragansett Bay.

Mr. Chairman, and fellow colleagues, the Clean Water Act is our Nation's major legislative vehicle to improve water quality.

The Chesapeake Bay, as our Nation's largest and most productive estuary, warrants protection under its statutes.

My legislation represents an important first step towards improving the bay's water quality and insuring future generations that the Chesapeake Bay will continue to be a productive center for economic development and aquatic life.

I urge its inclusion in this year's reauthorization of the Clean Water Act.

Again, Mr. Chairman, I want to thank you and members of your subcommittee for the attention you have given me and I welcome any questions you may have.

Mr. ROE. On behalf of the committee, I want to thank you for your testimony, and also the comprehensive approach you have taken, and also your leadership.

We have taken the first step now which is the study both here and in the Narragansett Bay. Now, the idea is, let's get on with it and get something done in the country. That is what your legislation directs itself to. I think it is poignant that you have on page three, I believe it is, where you mention at the top of your first paragraph, the enormous quantities of sewage, for example, and metals and things of that nature, other compounds, that are going into that bay which is true, of course, across the country.

So I appreciate your strong support. Be assured the greatest of attention will be paid to your legislation and the legislation and the direction which you wish to pursue.

The gentleman from Minnesota.

Mr. STANGELAND. I have no specific questions, Mr. Chairman. Mr. Dyson, in your statement you mention some management strategies and you might want to outline some of those manage-

ment strategies that have been developed and that you see a need for implementation. I share with you the concern for the body of water such as the Chesapeake Bay because I think it is very important to quality of life and income for the area, plus pleasure and enjoyment for a lot of people.

I commend you for authoring and bringing the legislation here to our attention and discussing it.

Mr. DYSON. If I could add one thing, I understand the chairman when these hearings continue in September, will in fact have the Governor of Maryland, the Governor of Virginia and the Governor of Pennsylvania here. If you don't have questions now, that may be an excellent opportunity to start bringing up this management strategy because, as you know, we have a 55/45 ratio, the amount of Federal dollars versus State dollars.

In the bill it specifically says that if a State does not come up with that sizeable financial commitment, and I say sizeable because our States are in a bind just like the Federal Government is right now, then the Federal commitment is not there, so we should see—I think we have already begun to see a commitment from them.

Mr. STANGELAND. Is there a Chesapeake Bay Commission to work together to solve problems on the Chesapeake?

Mr. DYSON. There is a bistate commission now between Virginia and the State of Maryland. It is made up primarily of State legislators. It doesn't deal with the situation in a comprehensive way, the way we are trying to approach this, by implementing some of the recommendations of the EPA study. There really isn't a mechanism today to deal with the way the EPA study I think would envision it.

Mr. STANGELAND. Thank you.

Mr. ROE. Are there any other questions of the gentleman from Maryland?

The gentleman from the Virgin Islands, Mr. de Lugo.

Mr. DE LUGO. Thank you, Mr. Chairman. I have no questions. I just wanted to commend you on your legislation, Roy, and say that I was fortunate enough to be on the water this past Saturday, and——

Mr. DYSON. You picked a good day to be there.

Mr. DE LUGO. Yes. I was amazed by the richness of the Chesapeake Bay and what nature has given us. I was thinking about how important it is to protect a natural resource like this, and I was impressed where you point out that, for instance, with the bay grasses, they once extended all across the floor of the Chesapeake at one time; they are nearly gone, and the dramatic downturn in the population of striped bass. In just a 6-year period striped bass dropped, according to your testimony, from 5 million pounds in 1973 to less than 1 million pounds in 1979.

Now, that is dramatic and certainly this legislation you are proposing has great merit. I want to commend you on coming forward with it. You have made a fine presentation today and I hope we will act favorably on this legislation.

Thank you, Mr. Chairman.

Mr. DYSON. Well, you and the committee, you are the committee. We hope to be able to reverse that with the rockfish, the striped bass. I think we can do it. This can be the beginning today.

Mr. ROE. Mr. Clinger from Pennsylvania.

Mr. CLINGER. Thank you, Mr. Chairman. I would just like to also commend our colleague, Mr. Dyson, for an excellent piece of legislation which I am privileged to be a co-sponsor of.

Mr. DYSON. I was going to mention that.

Mr. CLINGER. Just a couple of questions.

I understand that recently there has been a meeting of the Governors of Pennsylvania, Maryland and Virginia to discuss the overall problems of the Chesapeake. I wondered if you could comment on the current efforts by the three States to improve water quality in the Chesapeake Bay, and how would you see your bill as furthering those efforts?

Mr. DYSON. As you know, your Governor in fact initiated that meeting. That was held on the banks of the Susquehanna there at the State capitol in Harrisburg. That was the first time, to my knowledge, that the three of them specifically got together, Governor Robb, Governor Hughes and Governor Thornburgh to discuss one issue, the Chesapeake Bay.

All three have endorsed our effort, specifically this bill, and have indicated that they will make the kind of commitment a State would have to make. We are fortunate that all three States are willing to make it.

They again got together about a week and a half ago. While your governor was not able to attend, Pennsylvania's Lieutenant Governor did. So we had key State officials from the three States on the Chesapeake with the EPA Administrator.

As the gentleman from the Virgin Islands indicated, they looked at areas where there are no longer bay grasses, at areas where there used to be spawning grounds for the striped bass and other aquatic life. They again emphasized their commitment to the bay and I am very encouraged by that. I think, in fact, I would not have gone forward with this legislation if the three of them were not willing to get together and to make that beginning. So they have done that.

Mr. CLINGER. I think we in Pennsylvania tend to take it for granted and have really not been as involved as we should have been, and have not felt as directly involved as Virginia and Maryland.

Could you tell us what kind of impact Pennsylvania has on the water quality of the Chesapeake?

Mr. DYSON. Well, you have a little over 50 percent of the fresh flow into the Chesapeake comes from the Susquehanna. As the EPA study indicated, nitrogen loadings in the Chesapeake are one of the primary culprits to the degradation of the Chesapeake Bay. I have the figure here.

In an average year, about 29,000 tons of nitrogen comes into the bay just through the Susquehanna, about 1,400 tons of phosphorus comes through. So if we can stop that, and I might add that this situation results in a tremendous cost to the farmers of the state of Pennsylvania up and down the Susquehanna Valley, and significantly reduce run-off in the northern part of the Chesapeake Bay in Maryland, I think we are going to make a significant contribution to cleaning up the bay.

We talk about those bay grasses. The bay grasses have been depleted the worst, the worst situation is in the upper Chesapeake Bay.

Mr. CLINGER. As you say, I think it would be a benefit certainly to Pennsylvania farmers to address the problem because the other concern we have, of course, is soil erosion.

The soil being washed away into the upper reaches of the bay.

So I think that is going to clearly be to Pennsylvania's benefit to play a very active role in this program. We thank you again.

Mr. DYSON. I thank you for becoming a cosponsor.

Mr. ROE. Fine. The gentleman from California, Mr. Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

I too do want to welcome our colleague from Maryland and congratulate him on a very fine presentation. I don't have a question, just an observation on how casually Rep. Dyson mentioned that he was going to have the Governors from Maryland, Virginia and Pennsylvania meet in Wasington D.C. to discuss the Chesapeake Bay.

I want to point out a difference.

When I try to get our governor from California to come here to discuss an issue, I can't do it because many will say he is on a junket. The Governors in this area practically live here. You should appreciate the fact that you can have your Governors here and there is no criticism.

Anyway, Roy, I want to commend you on an excellent presentation.

Mr. DYSON. I wish I could say this a bit off the record. Since becoming a member of Congress, I serve on the Armed Services Committee and serve with you on the Merchant Marine Committee. I have taken one or two of those trips I thought were very worthwhile and received no criticism whatsoever.

Now, Barbara Mukulski and I, a member from Maryland, took a trip to the Chesapeake Bay. That is my district and her district, and one of our well known papers in the State called it a junket, and I am getting letters about it today, about this junket that I took to my own congressional district. But that is politics, I guess.

Mr. ROE. The gentleman from Arkansas.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman.

Roy, I remember with pleasure a trip I took with you down on the Chesapeake, to Jefferson Island in your district. That was a nice trip.

Mr. DYSON. I thought so too.

Mr. HAMMERSCHMIDT. I did get to examine the Chesapeake. I noticed that you commented that the substantial loss of aquatic life had been principally due to the result of non-point source pollution, and you mentioned that great input of phosphorus and nitrates that come into that body of water. I know that the Chesapeake is not just important to those surrounding States, but it is a national asset.

In my own district I have a small situation that involves a fairly large Corps of Engineers lake where we have a rather unique plains area in two counties. We too are getting a degradation of that water in that lake, and we think it is largely because of non-point source pollution.

I am following closely your progress on your efforts because I hope that this committee will help me address that problem as well.

I note that you think this is unique enough to where it should receive separate consideration by our committee rather than encompassing, in the large approach, trying to find the solution to nonpoint source pollution.

You want us to act specifically on your particular matter here, isn't that correct?

Mr. DYSON. Well, this is really what EPA identified as the primary source of the problem in the Chesapeake Bay's degradation. I guess what I am saying in answer to your question is yes.

Mr. HAMMERSCHMIDT. You know we realize that we have a national problem with nonpoint source solution which probably has not been adequately addressed. Maybe this would be a good study area.

Certainly it would be great for you and the Chesapeake Bay and, as I say, for the Nation, really. I am hoping that where we do have specific situations like yours and mine, maybe this committee can zero in on them and work with EPA to find the answer.

Thank you very much for your testimony.

Mr. ROE. The gentleman from Pennsylvania, Mr. Edgar.

Mr. EDGAR. Thank you, Mr. Chairman.

I too am a cosponsor of the bill that Congressman Dyson has introduced. I think it is a really good approach.

I particularly appreciate the cost-sharing that we built a relationship between the Federal and State governments to respond to this problem because no one entity of government should in fact bear the total cost.

I do have two questions.

One, in terms of the adequacy of the $10 million that appears on page four of the bill itself. The Chesapeake Bay, with all of the problems that you state and the expanse and nature of that particular waterway, seems to me to be of a size that the $10 million may not be adequate to really meet the kind of needs that you are outlining in this bill.

I know that that will be joined by other resources from State government, but do you have any studies, or any way of determining how close your estimate is to the real needs?

Mr. DYSON. To be honest with you, it is way off. The Chesapeake Bay Foundation I think has placed an estimate of something like $100 million, if you want to adequately clean up the Bay.

Mr. EDGAR. So we just left a zero off, is that right?

Mr. DYSON. I think we have to be realistic.

We are not going to get that kind of money. The Nation is facing a tremendous deficit. At the same time, if you want some sort of cost-sharing, the States cannot come up with that. Most of our States, you know, are bound by constitutional amendment to their constitutions that they have a balanced budget. So again for Pennsylvania, for Maryland and for Virginia, we are making a sizeable commitment to come forth with even that kind of money, the 45 percent.

Mr. EDGAR. The reason I raise the question with you is that the Chairman and ranking Republican of this committee has done a

good service in developing an omnibus water bill that really tries to deal with some of the environmental questions and focuses on leaning in the direction of the environment, where there is cost involved, have not been afraid to State what those costs are in mitigating that environmental problem.

I think here we ought not to underestimate what resources may be by both State and Federal government to make sure that this problem is cleaned up, which brings me to my last question.

That is, what happens if we don't do anything? What happens if we don't respond? We allow the levels of the pollutants in the Susquehanna to continue?

We allow the pattern to exist that is presently in place in this particular area? What would you predict by 1990, the year 2,000, just those kinds of foresighting years, 10, 15, 20 years out, as to the impact?

Mr. DYSON. I would think you would probably end up with basically a sterile estuary. There are very few bay grasses left now.

The sea grant program, a very good program, which, as you know, we endorsed legislation on the floor yesterday through the Merchant Marine Committee, is conducting research on trying to reestablish those Bay grasses. Dr. Rita Caldwell and her associates from the University of Maryland feel they have a good plan for bringing the grasses back, but obviously they are doing them in I guess you would say test ponds over on the Eastern Shore and on the Western Shore.

But, if they were to place them in, let's say, the Susquehanna Flats, which is up near the Aberdeen Proving Ground, and you haven't changed anything as far as the water quality, it would be a futile effort.

I don't think we can afford to let that happen. You would obviously see very few blues, very few blue crabs. We had a significant reduction in blue crabs this year.

You would see, as I have already mentioned, the reduction in striped bass, and the rockfish. We just see a continuation of that.

The Bay is also in the Atlantic flyway. I think it would make a considerable amount of difference in the types of birds you would see coming in during the fall and winter.

I might add to the members of the committee, because these birds feed on these various grasses that are dwindling they will decline due to lack of food. I am very pessimistic about this. If something doesn't happen, you can see, and the EPA has indicated just that sort of thing, that this is the direction, this is clearly the trend.

Mr. EDGAR. So there is a sense of urgency to do something in this area?

Mr. DYSON. I really think so.

Mr. EDGAR. Thank you.

Mr. ROE. Are there any other questions of the distinguished gentleman from Maryland? If not, we want to thank you very much, Roy, for being with us this morning and your splendid testimony and your leadership in this most important natural resources field.

Mr. DYSON. Again, I thank you, Mr. Chairman. I know what your schedule is like. You have got the big bill up tomorrow, I under-

stand. You mentioned it to me yesterday. My hat is off to you and all you are attempting to do in such a short period of time.

Mr. ROE. We appreciate that very much.

Our next witness, if we can reverse a little bit, is the distinguished gentleman from West Virginia, the Honorable Nick Rahall.

Does the gentleman wish to speak from his seat?

Mr. RAHALL. Mr. Chairman, if I might.

Mr. ROE. Of course.

Mr. RAHALL. I will speak briefly from here, Mr. Chairman, since my comments are very brief.

I ask unanimous consent that my prepared statement be included in the record at this point.

Mr. ROE. Without objection, so ordered.

[Statement referred to follows:]

STATEMENT OF HON. NICK J. RAHALL II, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF WEST VIRGINIA

Mr. Chairman I wish to thank all of those who are here today to express their views on the successes and failures of the Clean Water Act. As a result of this legislation, enacted in 1972, our nation's waters are much more cleaner and safer for all Americans than they were 11 years ago.

I do not intend to use much of the Subcommittee's time today, however I would like to highlight some of the concerns that have been brought to my attention about the Clean Water Act.

One of the most immediate actions Congress must take is to approve an extension of the BAT (Best Available Technology) deadline which is currently set for July 1, 1984. Many of our industries will not be able to comply with this deadline because EPA cannot publish the BAT guidelines in time for the affected industries to install the necessary pollution control equipment. I support the provisions outlined in H.R. 2305, a bill introduced by Congressman Oberstar, to extend the compliance deadline. This bill establishes a compliance deadline of July 1, 1986 or 36 months after the effluent guidelines are published by EPA. I hope the Subcommittee will be able to adopt the provisions of H.R. 2305 during mark-up.

Throughout the hearings on the Clean Water Act I hope our Subcommittee can address the serious funding shortfall in the Construction Grants Program. Two years ago, the President forced upon Congress drastic changes in this program. These changes are not adequately solving our nation's wastewater treatment problems. With municipalities continuing to be one of the country's greatest water polluters, we in Congress must act to help or municipalities meet their wastewater treatment needs.

Another issue, related to the Construction Grants Program is that of pretreatment. The current regulations administered by EPA have proven to be quite cumbersome and duplicative. This issue needs to be addressed in a manner that will provide the best means of pollution control while avoiding unnecessary and costly duplication of pretreatment standards.

Congress must strive to develop an effective Clean Water Act, one that address our most serious water quality problems while not imposing unnecessary burdens on our industries and municipalities. We need to make sure that the resources we devote to the cleaning of the nation's waters are spent wisely and on those projects that will produce a benefit for society. I want to express my appreciation to the Chairman for scheduling these hearings and I look forward to working with all of you to develop an effective Clean Water Act.

Thank you.

Mr. RAHALL. Mr. Chairman, I do appreciate the huge task you have undertaken. I know you have a full day of witnesses planned and you plan to continue throughout the day.

I feel that the Clean Water Act that has been a part of our Nation's laws for over a decade now has served this Nation well. We

have seen that our waters are a lot cleaner and safer for all Americans than they were 11 years ago.

I do not intend to use much of the subcommittee's time today. However, I would like to highlight some of the concerns that have been brought to my attention about the Clean Water Act.

One of the most immediate actions Congress must take is to approve an extension of the Best Available Technology deadline which is currently set for July 1, 1984.

Many of our industries, especially steel, will not be able to comply with this deadline because EPA cannot publish the BAT guidelines in time for the affected industries to install the necessary pollution control equipment.

I support the provisions outlined in H.R. 1305, a bill introduced by Congressman Oberstar, to extend the compliance deadline.

I would hope in the deliberations of the reauthorization the committee would incorporate Congressman Oberstar's extension of the BAT deadlines as part of our overall authorization.

Throughout the hearings on the Clean Water Act, I hope our subcommittee can address the serious funding shortfall in the construction grants program. Two years ago the President forced upon Congress drastic changes in this program. These changes are not adequately solving our Nation's wastewater treatment problems.

I believe it is time we considered those changes and perhaps made some changes thereto. Another issue related to construction grants program is that of pretreatment. The current regulations administered by EPA have proven to be quite cumbersome and duplicative. This issue needs to be addressed in a manner that will provide the best means of pollution control while avoiding unnecessary and costly duplication of pretreatment standards.

I feel confident, Mr. Chairman, that we will develop an effective reauthorization of the Clean Water Act, one that does address our most serious water quality problems in this Nation while not imposing unnecessary burdens on our industries and our municipalities.

We need to make sure that the resources we devote to the cleaning of our Nation's waters are spent wisely and on those projects that will produce a benefit to our society.

Again, I express my appreciation to you and members of the subcommittee for allowing me this opportunity to make a statement, and I would be glad to answer questions or enter into discussions with my colleagues. Thank you, Mr. Chairman.

Mr. ROE. I do want to thank the gentleman for his continuing leadership in this important field.

Is there anyone who has a particular question they want to ask our colleague from West Virginia on his statement?

If not, your statement will appear in full in the record and we will continue.

Our next group of witnesses is an environmental panel to be comprised of Dr. Ben Dysart, president of the National Wildlife Federation, together with Mr. John McComb, director of the Washington Office of the Sierra Club, and Mr. Daniel Weiss, conservation associate with the Izaak Walton League.

We want to welcome all of you to this opening hearing this morning.

If you would, Dr. Dysart, identify anyone you wish to for the record. We want to welcome you. We are particularly pleased that you have joined together at our opening hearings now because I think it is important at the outset that we get an overview and chance to consult and take advantage of your knowledge and ability for the distinguished national organization that you represent. We want to get sort of a foundation to begin with as to an overview going back when we all started this effort in the early seventies. We are about to take another corrective approach, to expedite and to make our work go better.

So we really particularly welcome you all this morning to set that foundation. I just wanted to welcome you on that basis.

The gentleman from Minnesota.

Mr. STANGELAND. Mr. Chairman, I just want to join in your remarks in welcoming this distinguished panel and their contribution and input.

I look forward to hearing what they have to say and look forward to having them work with us as we fashion the amendments to the Clean Water Act so that we do truly meet the needs of this Nation in maintaining and improving the quality of our waters.

Thank you.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follow:]

STATEMENT OF DR. BENJAMIN C. DYSART III, PRESIDENT AND CHAIRMAN OF THE BOARD, NATIONAL WILDLIFE FEDERATION

Mr. Chairman and Members of the Committee on Water Resources, I am Benjamin C. Dysart III, President and Chairman of the Board of the National Wildlife Federation. I want to thank you for inviting me to testify in support of H.R. 3282 the Water Quality Renewal Act of 1983, introduced by Chairman James Howard.

The National Wildlife Federation is the world's largest non-profit conservation and education organization dedicated to the wise use and conservation of the nation's natural resources. Today, I speak on behalf of our more than 4 million members and supporters and our 51 affiliated statewide and territorial organizations.

When Congress authorized the Clean Water Act in 1972, it affirmed the nation's commitment to fishable-swimmable waters. Although it is clear that this 1983 goal will not be met, substantial progress has been made toward its attainment. We support H.R. 3282 because it addresses continuing water pollution problems.

Several of those problems have been of particular concern to the Federation. They are (a) the importance of Section 404 in protecting our wetlands and water quality, (b) the more than 200 applications for discharging sewage into estuaries and the ocean, (c) the continuing impact of dams on water quality, and (d) the largely unabated problem of nonpoint pollution.

SECTION 404: PROTECTING WETLANDS

The protection of our nation's rapidly vanishing wetlands through a strong regulatory program under Section 404 continues to be one of NWF's very highest priorities. Because we place such great importance on this Clean Water Act provision, we intend to submit a separate detailed evaluation of statutory and regulatory revisions to the Section 404 permit program.

We also would very much appreciate the opportunity to return before this Subcommittee to give these revisions the full attention they deserve. At this time, however, we offer only the following brief comments.

You certainly do not have to be an engineer or a scientist to know that the nation's waters are ecologically and hydrologically interrelated. Consequently, the destruction or degradation of our wetlands adversely affects the physical, chemical, and biological integrity of *all* our waters.

According to the Army Corps of Engineers' Institute for Water Resources, in a draft report in 1981, without Section 404 wetland loss due to activity regulated by

the program would double. Section 404 plays an essential role in meeting the goals of the Clean Water Act, i.e., the restoration and maintenance of the nation's waters.

Over the past year and a half, the Department of the Army has substantially revised the Section 404 program; and further changes have just recently been proposed. A number of these revisions and proposed revisions concern us because they seriously cripple the ability of agencies to use Section 404 to protect the nation's waters, especially its wetlands.

By restricting the jurisdictional scope of Section 404, H.R. 1570, a bill introduced by Rep. Sam Hall of Texas, would have a serious adverse impact on the integrity of all the nation's waters. Moreover, there is no evidence of "unreasonable delay" on which to justify the bill. And, finally, even if "unreasonable delays" could be demonstrated, the restrictive definition of "navigable waters" proposed by H.R. 1570 would not solve the problem; but it could result in the loss of millions of acres of wetlands.

We support the amendments to Section 404 that are included in Chairman Howard's bill H.R. 3282. The amendment to Section 404(b) affirms the fundamental standards for protection of the aquatic environment (i.e., a presumption against disposing dredged or fill material in wetlands and the search for practicable alternatives) currently contained in EPA's guidelines. We believe this amendment is critically important because of the repeated and continuing attempts by the Department of Army to weaken the substantive standards of the 404(b) guidelines.

The amendment to Section 404(q) seeks to make interagency review of permits once again a meaningful and equitable process. The amendment provides the Federal resource agencies with sufficient time to evaluate controversial permits and removes the authority for the Assistant Secretary of Army for Civil Works to veto permit referral requests by those agencies.

Finally, we would encourage this Subcommittee to include an amendment to Section 505 to allow citizens to bring lawsuits against the Secretary of the Army for failing to carry out his Section 404 duties. Section 505 already allows such action against the EPA Administrator for 402 permits. We see no reason to treat Section 404 any differently.

OCEAN DISCHARGE WAIVERS

In 1977, Congress added Section 301(h) to the Clean Water Act. This controversial provision established a means by which publicly-owned treatment works discharging through outfalls into oceans or certain estuarine areas could obtain waivers from secondary treatment on a case-by-case basis if approved by EPA after approval by the State. Before obtaining a waiver, the municipality would have to demonstrate that the modification would not impair the integrity of the receiving waters.

The provision was the Act's first major departure from a clear cut requirement of a strict technology-based approach to the control of water pollution. Since its adoption, 209 coastal cities and communities have applied for waivers. Many are large industrialized cities including Boston, Philadelphia, Los Angeles, and Miami. In some cases, applicants are proposing to discharge sewage that is virtually untreated into ocean waters and estuaries.

The resulting discharge of raw or minimally treated sewage can have a number of serious effects. Sewage treatment plants, especially those near large cities often have discharges of high levels of toxics such as cynaide, mercury, copper, lead, and cadmium that exceed EPA marine water quality criteria and therefore threaten aquatic life and the food chain. While ocean outfall waivers may have minimal environmental impacts from some small non-industrialized coastal municipalities, we think they are particularly inappropriate for large industrialized municipalities with large quantities of toxic constitutents in their discharge. Further, large communities with their attendant industrial discharges and need for water recreation, place a larger number of other demands on their waters in comparison to small communities. In addition, NWF believes that waivers should not be granted to any municipality proposing to discharge into sensitive estuaries where effects would be magnified by slow flushing rates.

We strongly support the provisions in Chairman Howard's bill, H.R. 3282, which would amend Section 301(h) to eliminate waivers for discharges into estuaries; require a minimum of primary treatment before discharge under a waiver; require pretreatment for the control of toxics in areas with a population greater than 50,000; allow waiver applications to be reviewed with consideration of other pollutant sources in the immediate area; and allow EPA water quality criteria to be taken into account.

Need for amendments in ocean discharge waivers

The original impetus behind ocean waivers reflected a general feeling that the more "traditional" pollutants such as nitrogen, phosphorus, biological oxygen demand (BOD) and suspended soilds would not present problems in the ocean environment if they were discharged in large quantities. In fact, an examination of EPA documents shows that the ability of the ocean to absorb these pollutants is not without limit. Los Angeles County's historic discharges have led, according to EPA's November, 1981, decision document on the L.A. County waiver, to "Massive changes in the structure, function, abundance, and diversity of inshore plants and animals . . ." Recent improvements in the discharges are, again from EPA's tentative decision, "apparently insufficient to allow for complete recovery of the kelp beds." Massive displacements of fishes are due to the L.A. County discharges. An area 4.1 square miles suffers decreased fish abundance. The outfall area is a center of the fish diseases. The diseases in fish include fin erosion, lip and skin tumors, bulging eyes, parasites, body deformity, and color aberrations.

L.A. County will improve the quality of its discharge if they are granted a 301(h) waiver. But EPA cannot confidently project a return to normal condition. They are relying on the future monitoring program to make this determination.

EPA's tentative decision on the L A. County outfall indicates that the proposed discharge will decrease the dissolved oxygen content of bottom waters by about 10 percent. This is the maximum amount allowed by the California State Water Resources Control Board. The March, 1981, TetraTech report to EPA indicates that the proposed outfall will lead to the presence of hydrogen sulfide throughout 1.5 square miles of ocean floor. The presence to hydrogen sulfide implies that this 1.5 square miles will have anaerobic sediments. This 1.5 square miles is more than ten times the area of the zone of initial dilution. Little or no anaerobic sediments are predicted if secondary treatment is used. Many of these alterations from the proposed discharge are almost entirely due to the result of the input of BOD and suspended solids rather than the result to the input of toxics. Thus, the ability of the ocean to absorb traditional pollutants, let alone toxics, is limited and certainly warrants intensive case-by-case scrutiny.

No estuarine waivers

The first proposal in H.R. 3282 which I would like to address is the proposed limitation of sewage discharge waivers to the territorial sea and to the waters of the contiguous zone. This eliminates from consideration estuarine waivers, and waivers in bays within the continental baseline.

We support this limitation because of the importance of estuaries. I am sure you have often been told that estuaries support 80% of our commercial and recreational fisheries catch, and that a large and growing fraction of our population lives close to estuaries. Estuaries are our most intensely used marine waters. We can only expect the intensity of their use to increase. Thus, in estuaries of all places, we should, consistent with the principles of multiple use management, support tighter control over sewage discharges rather than permit less control by allowing for waivers from secondary treatment.

Let me give you some examples of stresses that existing sewage outfalls are placing on several estuaries and costal bays.

Puget Sound.—Every day 230 million gallons of chlorinated sewage effluent are discharged into Puget Sound. In addition, 3,690 metric tons of zinc, 1,958 metric tons of copper and 3,690 metric tons of lead are discharged annually. Much of this finds its way into the bottom sediments of Poverty Bay due to unusual current patterns in the area. As a result, most shellfish growing areas in central Puget Sound are closed to harvesting because of bacterial and toxic contamination, many beaches are closed to swimming, and a large number of diseased bottomfish have been observed in the Sound. Commencement Bay, in particular, is severely threatened by a high concentration of organic pollutants from discharges. Fish diversity has also decreased in this area. Today, more than 30 waiver applications are pending in the Puget Sound area.

San Francisco Bay.—San Francisco Bay is also a severely stressed estuary. The striped bass population is being diminished and degraded. The State Health Department discourages shellfish harvesting in the area. Twelve applications are pending for discharging into the Bay 120 million gallons per day (MGD) of minimally treated sewage. It has been estimated that water in the southern portion of the Bay may remain as long as two months before currents send it northward out of Bay.

Massachusetts Bay.—Boston Harbor is another example of a productive estuary which has been and is continuing to be impacted by the disposal of sewage. The Massachusetts Division of Marine Fisheries concluded in a report in 1966, which

they say remains true today, that unsightly sewage plumes have adversely affected the marine resources and aesthetic value of the area by increasing bacterial contamination. In addition, bioaccumulation of toxics by fish, shellfish, and other animals along the food chain is well documented. The shellfish industry has suffered great losses due to restricted clam fishing in the area. John Felix of the Mass. Department of Environmental Quality Engineering reports that approximately half of the area is closed to shellfishing, and shellfish caught in the other half must be sent to a special cleansing plant before they are sold. Although degradation of the fishing resource in the area cannot be attributed completely to outfalls, they are an important contributing source.

New York Harbor.—A large number of ocean outfall waiver applications from New York and New Jersey are concentrated in the Hudson River-New York Harbor area. Of 14 applications, eight have initial dilution factors of less than 40:1. This means they have high concentrations of suspended solids and BOD that stay in the discharge area and disperse slowly. Of the remaining six, three have initial dilutions above 40:1 in the winter but probably not in the summer, and the other three do not provide enough information to determine initial dilution. Seven of these applicants' proposed discharge have toxics in amounts which exceed EPA's marine water quality criteria and all would be discharging into waters that do not support a balanced, indigenous population of fish, shellfish, and wildlife or do not meet water quality standards for some portion of the year. Taken together, these applications would permit the release of 1.5 billion gallons per day of sewage at less than secondary treatment levels in the New York Harbor area, much of it containing large quantities of toxics from industries.

Toxic requirements for ocean waivers

Two proposed amendments address toxic effluents. One proposal has a technology basis and the other a water quality basis. Together, we believe they will limit the flow of toxics to the sea from sewage plants. In order to protect the marine environment toxic material input to the sea should be limited. Dispersing toxics in a fluid is not the appropriate way to dispose of these materials. Table I of our testimony shows how much secondary treatment can control toxics in comparison to lower levels of treatment. The table shows, for example, that the concentration (or amount) of copper is typically increased by 75 percent or more as a publicly owned treatment work (POTW) shifts from secondary to primary sewage treatment. In the L.A. County case, a shift to advanced primary treatment from secondary treatment would lead to a 33 percent increase in the concentration of DDT, a 67 percent increase in mercury, a 60 percent increase in copper, and a 31 percent increase in cadmium. Toxics are such a hazard to the marine environment they should be treated much more stringently than conventional pollutants.

The discharge of toxics from POTWs is not a minor problem. The report of a panel of fifteen experts in a 1982 Estuarine Research Federation publication indicates that sewage effluent is a large contributor of metals to the New York Bight. According to these experts, metals inputs from sewage effluents contribute to red tides, the erosion of fins in fishes, damage to the benthos on which fish depend, and damage to fisheries in general. Despite this fact, many of the POTWs discharging into the New York Bight are proposing to lesson their level of sewage treatment.

Of the 19 POTWs which have received tentative approvals from EPA at least four (Lynn and S. Salem, Mass., Seattle-Richmond, Wash., and Oxnard, Calif.) have effluent which containts pollutants whose concentrations will exceed EPA's Water Quality Criteria to the detriment of marine life.

Toxic materials in the effluent of the South Essex, Mass., plant are expected to exceed EPA water quality criteria for the protection of marine life after initial dilution. The concentration of copper in wet weather will be 1.4 time the acute criterion and 8.2 times the chronic criterion. Total chromium concentrations in dry weather will exceed the chronic criterion. Several organic compounds such as endrin aldehyde and a half dozen pesticides may also be discharged in harmful quantities. However, the analyses by South Essex are inadequate to make the determination as to whether or not these discharges would exceed EPA water quality criteria. Besides these problems, the South Essex POTW has toxics that approach EPA's Water Quality Criteria with compounds such as mercury and nickel discharged in amounts that will lead to concentrations that are about 50 percent of EPA acute water quality criteria. Pretreatment may ultimately limit the input of some or all of these toxics into Massachusetts Bay. Secondary treatment would further limit the entry of these compounds.

The current 301(h) requirement for the control of toxics is that municipalities must enforce all applicable pretreatment requirements, and that it must also estab-

lish a schedule, to the extent practicable, to eliminate the entrance of pollutants from non industrial sources into the POTW.

The control of toxic materials at the source by pretreatment programs can be an effective and efficient way to limit the flow of toxic materials. However, Federal pretreatment standards are, in many cases, not yet developed. In addition, we can expect that they will be subject to protracted litigation once they have been developed.

H.R. 3282 would also amend Section 310(h) to require large dischargers to limit their discharge of toxics under a waiver to the same extent that such toxics would be limited if the POTW employed secondary treatment. Municipalities would be required to have pretreatment program to limit the discharge of each priority pollutant in its POTW influent.

The proposed modification in the pretreatment provision of Section 301(h) will provide some protection against toxics in the absence of final Federal pretreatment standards and in lieu of secondary treatment.

Would EPA or a municipality know how much to control toxics under this provision? We believe that the answer is "yes". This proposal applies to POTWs serving more than 50,000 people. Sixty-one such municipalities have applied for waivers. Forty-four percent of these (or 27 POTWs) are currently operating at secondary treatment. A few others are proposing only seasonal waivers. For these two groups, the necessary level of toxics removal may be set quite precisely. Required levels of toxics removal for remaining POTWs in this size class could be set in a number of ways. One way would be by extrapolation from existing data such as presented in the second column of Table I. Another method to set toxics limits could include more detailed analyses of the effluent characteristics and modeling of changes in the effluent resulting from additional treatment.

A second proposed addition to 301(h) addresses the problem of toxic material in POTW effluent. This proposal is a requirement that POTW effluent meet the criteria established under section 301(a)(1) after initial mixing. The 301(a)(1) criteria include EPA's saltwater quality criteria for the protection of marine life. As I have already noted, four of the POTWs that EPA has tentatively approved for a waiver do not meet these criteria. Meeting the water quality criteria is essential to satisfy the statutory requirements that ocean discharges not interfere with the quality of water necessary to protect a balanced indigenous population of fish, shellfish, and wildlife. Thus, this addition would provide additional guidance to EPA on the quality of water to be maintained. This provision, as a quantitative water quality based approach, complements the quantitative technology based modification to the pretreatment requirement.

Given a required level of removal, how could a municipality control its level of toxics removed in the absence of a full Federal pretreatment program? Many municipalities have sewer regulations which include, or which could include, local pretreatment standards to arrive at the necessary level of toxics removal.

Require minimum of primary treatment

Another proposed provision is to set a primary treatment floor to any discharge granted a 301(h) waiver. We believe that primary treatment is an absolute minimum level of treatment dictated by fundamental principles of sanitation as well as common sense. We do not believe that any community should be permitted to discharge sewage that has not been through even this minimal processing. A primary floor on treatment was EPA's initial interpretation of 301(h), but this interpretation was overturned by the courts in May, 1981. Passage of this measure would provide EPA with the ability to enforce this basic level of sanitation.

Cumulative effects

The proposed change adds that the ocean outfall may not interfere with water quality alone or in combination with pollutants from other sources. Thus EPA must consider the effects of all of the discharges in the area on the quality of the marine waters. If all of the discharges together do not provide for a balanced indigenous population of fish, shellfish, and wildlife, then the application for a waiver from secondary will not be granted. We support such a provision.

NWF monitoring proposal

After a review of a number of 301(h) documents, we are concerned because EPA's determinations of the expected level of impact often do not come from the data supplied by the applicant. The statute says that, "The administrator may issue a permit if the applicant demonstrates to the satisfaction of the Administrator that the various requirements are met." Technical evaluations of ocean outfall waiver

applications prepared by a consultant that have now been tentatively approved for EPA are replete with language such as: "Phytoplankton sampling conducted by JCA [a consultant] in support of the preliminary application is insufficient for making the required BIP comparisons for the following reasons: Samples were taken in the wrong and at too few locations with inadequate sampling or inappropriate sample processing . . . The phytoplankton sampling program of CDM [a consultant] suffered from similar deficiencies." (Draft Technical Evaluation Report (TER), South Essex 301(h) application, TetraTech, p. 139-140.)

In another case:

"Taxonomic studies of the phytoplankton community in the vicinity of the Orange County outfall have apparently not been conducted, so it is not possible to compare such parameters as species composition, abundance, diversity, and dominance between areas near the outfall and control areas." (Orange County Draft TER, p. 284).

In response to the fundamental test of the statute—will the discharge interfere with a balanced indigenous population (BIP) of marine life?—the technical evaluation for Monterey, California, notes for fishes that:

"The applicant does not address demersal or pelagic fish communities in response to this question." (Draft TER, p. 214.)

Similarly, the Draft TER (p. 259) for Santa Cruz states:

"The applicant's fish data contribute to a general description of the demersal fish communities of the biogeographical zone. The limited data do not provide, however, for a conclusive evaluation of the effects of the existing outfall on fish assemblages."

In a response to the same question, but for benthic infauna, the Draft TER (p. 266) for West Point, Wash., states:

"The applicant cites studies by Harmon et al. (1977) and Thom et al. (1979) in support of the response that the West Point discharge does not interfere with the protection and propagation of a BIP of benthic invertebrates. In this evaluation (Part B, Section 6), the sampling design and data reported for both studies were determined to be inadequate to demonstrate the presence or absence of a BIP. Data given by Thom et al. (1979) suggest that current scouring of the bottom is biologically very important near the apex of West Point and that suspended organics from the outfall may be causing "enrichment" of benthic communities in nearby areas not subject to intense current scouring. However, the study design and data presented by Thom et al. (1979) are inadequate to assess faunal "enrichment" or to statistically separate the biological effects of current scouring from the biological impacts of the effluent."

Despite these significant data gaps, EPA tentatively approved all five of these applications in 1981 and 1982.

If EPA can project a balanced indigenous population (BIP) given inadequate information, the monitoring program once a waiver is granted must provide definitive proof that a BIP is in fact maintained. Providing for the protection and propagation of a BIP of fish, shellfish, and wildlife requires an understanding of the natural environment and its variations that extends beyond the point discharge. To do this, not only must a monitoring program look to localized effects, but also the regional context. Monitoring systems being proposed can be altered so that their ability to produce information to compare impacts to the statutory limits would be much improved. To this end, we propose two additions to the statute. Add as 301(h)(3)(i):

"In the event that two or more municipalities with discharges in excess of 5 million gallons per day and with waivers resulting from this section are less than 50 miles apart, EPA shall require the municipalities to submit a joint plan to monitor the effects of the discharges and background marine conditions in a uniform way not only in the immediate vicinity of the discharges, but also in the marine waters of the region between and surrounding the adjacent discharges."

Under this proposal, we would envision monitoring around each individual outfall similar to that which EPA's regulations currently require. In addition, under our proposal, there would be additional monitoring to provide a solid base of data to which the effects of sewage outfalls could be compared. The additional data would provide those examining the impacts with a far better ability to modify the permits in the future.

This proposal would be effective because adjacent municipalities would use similar methods so that their results could be comparable. The comparability of the data would enhance its value. Our proposal would also require municipalities to collect additional information that would provide a regional context for the interpretation of local data. This proposal would lead to the establishment of intermunicipal agreements in a number of places assuming that waivers may be finally granted in these areas. The work of the Southern California Coastal Water Resources Project, or SCCWRP, reflects the results of one such agreement voluntarily imposed. The work of SCCWRP is most valuable in describing the basic ecologic context of the area so

that interested parties may have a base of fact over which to debate the impacts of a specific discharge.

There is a second shortfall in monitoring programs for which we propose another addition. We believe that a BIP should not only allow organisms to survive in the area around the discharge, but also to recruit and to reproduce. Proposed monitoring plans generally measure only the presence or absence of species. With knowledge of the natural history of the organisms, and a understanding of ecological principles, some of the functions of the populations can be constructed. However, reproductive success or failure must be studied more directly.

To remedy this, our second addition to the statute would be 301(h)(3)(ii):

"Monitoring for discharges exceeding 5 million gallons per day shall include measures of the reproductive status, community structure, population dynamics and bioaccumulation of toxics in a representative sample of biota."

This proposal is different from existing EPA practices primarily in that it considers the reproductive status of the species. The additional requirements of this proposal would help EPA and the interested public to interpret the results of the monitoring program in light of the biological standard.

DAMS

As you probably know, NWF has been concerned about impact of dam discharges for quite some time. This includes existing dams and dams under construction such as the Richard B. Russell Dam on the Savannah River near my home in South Carolina. Dam can adversely affect downstream and in-reservoir water quality and aquatic habitat in a variety of ways. This tends to be much more of a problem in some areas than others. In addition, downstream communities may have to set higher sewage treatment levels because of low dissolved oxygen caused by discharges from upstream dams.

During July 1981, tens of thousands of fish were killed below the Conowingo Dam in Maryland on the Susquehanna River because of low levels of dissolved oxygen (DO) in the water. In addition, an annual loss of fish valued at $358,000 is the result of low levels of DO below the Table Rock Dam on Lake Taneycome, Missouri.

Dams can cause major water quality problems due to physical, biological, and chemical changes when it is stored behind a dam. Not all dams, however, can be considered problematic. Water quality problems tend to occur with high dams and large reservoirs. Large reservoirs in the south often stratify in the summer, causing low DO, extremes in temperature, and higher concentrations of metals in the released water. Of course, there are trade-offs. The cold hypolimnetic waters released from some hydropower dams can make possible a trout fishery where natural temperatures would have been too warm.

Problem reservoirs tend to be those over 40 feet in depth and with a storage capacity of 1,000 acre-feet or more. By our estimates there are less than 3,000 such dams which could cause water quality modifications or problems.

Chairman Howard's bill would require that EPA, in cooperation with other interested Federal agencies and states, study and monitor the effects of dams on our nation's waters. EPA would present this study with recommendations for control to Congress by December 1985. Whether it is for public water supply or sport fishing, the public has a substantial stake in reservoir water quality. The public should have the opportunity to have input to this study, too, in addition to that of EPA and the state agencies.

NWF applauds this effort by Chairman Howard. It is a good first step toward the control of pollution caused by dams.

NONPOINT POLLUTION

In 1977, the General Accounting Office estimated that over half the pollution entering the nation's waterways was from nonpoint sources, and the most important of nonpoint sources were agricultural activities, urban storm water runoff, silviculture, and poorly designed and managed septic systems. Unfortunately, the nonpoint pollution situation has not improved in the interim.

The Council on Environmental Quality's 1979 Annual Report stated that nearly all drainage basins were affected in some parts by pollution from agriculture and urban runoff. In 1982, 6 states reported the primary cause of water degradation for their state was nonpoint sources. This year, 15 of 20 states reporting progress towards the Clean Water Act's fishable/swimmable goal list nonpoint pollution as a significant pollutant source are being identified as the major contributor to pollution in large water bodies such as the lower Great Lakes and Chesapeake Bay, as well as the bays, surface water, and groundwater of Long Island, New York.

Since 1974, $451 million have been spent on studies, plans, and demonstration projects. The failure in not substantially reducing nonpoint source related pollution has not necessarily been in the plans and projects, as it has been out our failure to implement what we have learned.

One reason for this lack of implementation is the prevailing perception that the problem of nonpoint pollution is enormous and the solution extremely difficult to devise. That perception is incorrect. If we examine two of the major sources, i.e., agriculture and urban runoff, we find that many effective techniques are already known and are being used on a small scale and that, by applying these techniques to the critical areas nationwide, a substantial reduction of pollution can be achieved.

Agricultural nonpoint pollution

Sediment is the major water pollutant from agricultural activities. Approximately 6 billion tons are lost from farm lands yearly. This soil loss seriously affects not just productivity of the land but also the quality of the waters into which most of the soil flows. Scientists estimate that 75 percent of the sediment entering streams, rivers, and lakes comes from soil erosion on cropland.

The General Accounting Office has reported that soil losses resulting from poor agricultural practices are 25 percent worse today than in 1934. In Illinois, about 2 bushels of soil wash from cropland for each bushel of corn produced in the state. The Illinois Natural History Survey has found that the backwater lakes along the Illinois River are half filled with mud because of siltation from neighboring farms produced in the last 15 years.

However, it is important to realize that less than 3 percent of the land contributes over one-third of the total annual siltation loss. Controlling erosion from a surprisingly small number of areas, and some of them rather small in size, can result in a majority of the pollutant reduction needed to protect water quality. This applies to small river basins as well as the nation as a whole.

In most instances, EPA-funded Areawide Management Plans, better known as "208 plans", identified familiar soil and water conservation measures as the so-called best management practices or "BMPs" for controlling erosion and runoff. These included such traditional soil conservation practices as contour farming, chisel plowing, buffer strips, and crop rotation. In fact, USDA studies have shown that minimum till or no-till practices control runoff while maintaining or increasing crop yields.

There are BMPs available which, if properly selected, designed, constructed, operated, and maintained, individually and as systems of BMPs, can effectively reduce the export of soil, nutrients, herbicides, pesticides, oxygen-demanding materials, bacteria, heavy metals, and other toxics off-site and into surface waters. This can be done at a cost which is not prohibitive, if there is a genuine commitment to cope with this serious long-standing problem and move on toward protecting our nation's streams.

The water-quality-oriented committees of the Congress, the EPA, and the state agencies with water quality responsibilities have to insist that water quality be the real focus, and that the right BMPs be specified, put in place, and operated properly. And my own environmental engineering profession has to recognize the problem and utilize the latest in proven cost-effective design procedures for nonpoint pollution.

You in the Congress and the American taxpayers should expect the same level of performance, effectiveness, and reliability for nonpoint control facilities as we all expect of environmental engineers in dealing with industrial and municipal wastes that come in a pipe to a modern and well operated wastewater treatment plant.

The 208 programs have also led a number of states to adopt both voluntary and mandatory control programs for agricultural nonpoint pollution. Although the implementation of many of these programs has been very disappointing, the existence of such programs has caused the states to face farm-generated water quality problems explicitly, and to build planning and administrative programs to deal with them. Under 208, the states had to establish an identification and priority system and give evidence of legal authority to act when it was deemed necessary. By working with Soil Conservation Districts and Resource Conservation Districts, farm organizations and farmers have begun to recognize the need to act in dealing with impaired off-farm, in-stream water quality.

In addition, the incentive of Rural Clean Water Program funds has induced serious action in some areas. The Rural Clean Water Program of 1977 specifically authorized the Department of Agriculture to sign contracts with land users in selected high priority areas. Under these contracts, the land user receives special technical

assistance and costsharing to improve water quality by reducing sediment and other agricultural pollution. Other Federal programs assisting farmers with nonpoint pollution cleanup include the Model Implementation Program and the Clean Lakes Program.

The Model Implementation Program, a cooperative effort between EPA and the Department of Agriculture, tested so-called best management practices in seven agricultural areas. Although results were very mixed because of the short duration of the projects and institutional difficulties, much of the information gathered can be put to practical and beneficial use.

The Clean Lakes Program has resulted in some examples of cleanup of agricultural runoff. On the Cobbessee and Annabessacook watersheds in Maine, farmers have built animal waste storage facilities to store animal wastes over the winter rather than spreading them on top of the snow. This is resulting in substantial improvements in the water quality of the lakes.

There have been some real bright spots and good programs and individual projects, and there have been some with very modest water quality accomplishments. Taken together, however, these programs—208, Model Implementation, Rural Clean Water, Clean Lakes—have resulted in plans and management practices developed on a small scale. What is needed now is a nationwide program with approriate management practices which provide water quality benefits implemented in all the areas where nonpoint pollution is a critical problem.

Urban runoff

The other source of nonpoint pollution is urban runoff. Pollution in urban runoff includes air pollutants that have settled in streets, erosion from construction sites, salt and other de-icing chemicals, litter, and animal refuse. Ninety five percent of the bacterial loading to the bays of Long Island comes from urban runoff and has resulted in the closing of many shellfish areas. Most of the lakes selected for study under the Clean Lakes Program are urban park lakes adversely affected by urban runoff.

Similar to agricultural nonpoint pollution, most of the urban runoff pollution is coming from limited areas, i.e., the industrialized and highly urbanized sections of a city, and can be controlled through appropriate management practices targeted at those areas. Such practices include more frequent street cleanings, use of porous pavement, and suitably designed and maintained sedimentation and catchment basins to reduce the amount of dirt and soil carried in runoff.

The National Urban Runoff Program is studying 28 metropolitan regions. Baltimore has been identified as having the most contaminated runoff of the 28. Yet it is only a few areas in Baltimore that contribute most of the pollution: the heavily industrialized and urbanized sections. Solutions that have been identified in Baltimore include more frequent street cleaning, and paving streets and parking lots with a coarser type of asphalt that lets water percolate through into the earth.

The tangible costs to society of letting nonpoint pollution continue unchecked are quite high. The nation is losing productivity from its land, killing and smothering fish and wetlands, contaminating fish and shellfish so they are inedible, and spending over $300 million a year dredging the resultant silt from our rivers, lakes, and harbors. The list could go on. And the intangible but very real costs to the public are also great.

I urge you, the Subcommittee, to adopt a nonpoint pollution control program. The program should target those waterways where nonpoint runoff is the major source of pollution. It should be mandatory on the states to develop and specify appropriate and effective BMPs that will improve water quality for those individual sources producing the pollution.

A date should be set by which all sources will be required to implement suitable practices and systems of practices. In addition, Federal agencies should make their assistance programs consistent with a state's program so that a Federal agency is not encouraging a practice which a state is trying to discourage.

Finally, EPA should have the authority to step in and develop a program if the state fails to act. In our opinion, this Subcommittee can make the most meaningful improvement in the Clean Water Act for this reauthorization period by adopting a mandatory control program for those limited areas and sources which contribute to nonpoint pollution.

Thank you, Mr. Chairman, for the opportunity to testify on behalf of the National Wildlife Federation.

TABLE I:. The Effect of Secondary Treatment on the Removal of Toxics From Sewage Effluents

Pollutants	Percentage Increase in Amount of Material Left in the Effluent as a Result of Primary Treatment in Comparison to Secondary Treatment[1]	Percentage Increase in Effluent Concentration as a result of discharge under a 301(h) waiver as compared to secondary treatment, L.A. Summary of ocean waiver applications [1]

Receiving waters under Howard amendment:	
Estuary discharge	132
Ocean discharge	74
Location:	
East Coast	98
West Coast	112
Enclosed Bays:	
New York Harbor	26
Massachusetts Bay	6
San Francisco Bay	12
Puget Sound	28
Treatment level:	
Backslide from secondary	65
Proposing or at primary	152
Proposing less than primary	6
Toxics for ocean dischargers:	
Effluent contains toxics which exceed EPA marine water quality criteria	10
Population factors for ocean dischargers:	
Less than 50,000	33
Equal to or greater than 50,000	29
Discharge status:	
Proposed discharge pipe	49
Existing discharge pipe	158

[1] There are presently 210 applications, but some do not contain enough information to include under certain headings.

STATEMENT OF JOHN MCCOMB, DIRECTOR, WASHINGTON OFFICE, SIERRA CLUB

Mr. Chairman and members of the Subcommittee, I am John A. McComb. I am the Director of the Washington Office of the Sierra Club, one of the nation's oldest conservative organizations, with over 350,000 members organized in chapters and groups throughout all fifty states.

The Sierra Club members have chosen clean water and toxics legislation to be among their highest priorities for the 98th Congress. We support H.R. 3282 because it embodies a clear commitment to maintain and improve the quality of America's waters.

Control of water pollution is a top priority to the American people, as well as to members of the Sierra Club. In December 1982, Louis Harris and Associates conducted a nationwide survey of American attitudes toward water pollution for the Natural Resources Council of America. Here are a few highlights from that survey, a full copy of which is submitted for the record. The Harris poll asked people how important a variety of factors are in improving the quality of life in the United States. Curbing water pollution was rated "very important" by 74 percent, identical to the rating for "keeping the economy growing."

Concern about toxic wastes is even greater. An overwhelming 95 percent of Americans feels that disposal of hazardous wastes is a serious problem in America. Ninety-three percent feel that pollution of lakes and rivers by toxic substances from factories is a serious national problem.

According to EPA estimates, nearly 300 million excess pounds of toxic pollutants will be unnecessarily discharged into America's waterways and sewer systems each year that pretreatment and BAT controls are delayed. These are chemicals that cause cancer, birth defects, and have other adverse effects on human health and aquatic life.

In order to help this Committee help frame the major issues with which you will have to deal, I would like to briefly discuss to specific issues in the remainder of my testimony. Both deal with controls of toxic water pollution, particularly with the need to reduce industrial discharges of toxic wastes into sewers and waterways. These two areas are pretreatment of industrial wastewater and best available technology (BAT).

In 1977, Congress wisely enacted a national program requiring pretreatment of industrial wastes to remove toxics before they enter municipal sewage treatment plants. As this program is beginning to take effect, it is coming under attack from some industries that want to avoid the costs of pretreatment and from some municipal sewerage agencies that do not want to meet federal pretreatment requirements.

There have been suggestions for weakening the programs by allowing municipalities to use their own pretreatment programs instead of the federal one. Any new

program to exempt municipalities or industries would delay for years the implementation of pollution controls. Planning a new program and tailoring it to each local community would severely strain the resources of the Environmental Protection Agency, which are sorely needed elsewhere. In addition, it is more fair for industries to pay to clean up their wastes.

The final result of pretreatment waivers would probably be a higher level of toxic pollution, because only municipalities with weaker pretreatment programs would be motivated to apply for waivers. In the best of cases—where the sewage treatment plant is successfully removing the toxics from the water—there is still the problem of contaminated sludge. A small quantity of concentrated toxic wastes removed from the industrial effluent at the plant site can sometimes be recycled, and in other cases it can be much more efficiently destroyed or disposed of than vast quantities of municipal sludge that contain lower concentrations of toxic wastes.

We are pleased that H.R. 3282 would not weaken the existing national pretreatment program.

The "best available technology economically achievable" or BAT guidelines are designed to reduce industrial toxic pollution discharge directly into rivers and other waterways. The Clean Water Act requires industries to comply with BAT by July 1, 1984. However, EPA has been slow to formulate the BAT standards and is not expected to finish issuing them until that date. Industries will then need some time to comply with the guidelines. No one disputes the need to extend BAT deadlines; the question is the length of the extension.

One of the questions in the Harris public opinion poll was specifically designed to measure the public's commitment to BAT. After the 1977 amendment requiring BAT was explained to them, fully 53 percent of those surveyed felt so strongly about the need to control and prevent water pollution that they were willing to accept plants being shut down rather than allow plants waivers or variances from the BAT requirement. An additional 23 percent believed that only a plant which would otherwise have to close down should be granted a variance from BAT.

Every year of delay in the implementation of BAT will result in about 100 million pounds of excess toxic wastes being discharged into the nation's waters. Deciding the length of the delay of deadlines therefore has a significant impact on the evironment and public health. The EPA is issuing BAT regulations according to a phased schedule from January 1981 to June 1984.

The Sierra Club supports H.R. 3282, which allows industry three years to comply with BAT from the date the regulations are issued. Representatives from EPA and several industries have testified that three years allows sufficient time for compliance. H.R. 2305 would allow needless extensions beyond three years in many cases which we oppose.

The Sierra Club strongly opposes exemptions or variances from BAT requirements. Congress rejected the idea of variances in 1977, and they are no more justified in 1983. Chemical industry representatives have argued that they should not be required to implement BAT when water quality standards are being met. This argument is not credible because, at present, the water quality standards of most states do not even have criteria for many frequently found toxic pollutants. Particularly in the area of toxic pollutants, we should err on the side of caution. A program of BAT variances would inevitably increase hazards to public health.

I will conclude by reiterating the Sierra Club's support for H.R. 3282. We believe it provides a sound basis for renewal of the Clean Water Act. We and other representatives of the environmental community will be perpared to provide more detailed testimony and information at the additional hearings on this subject planned by this Committee.

Study No. 822033

A SURVEY OF AMERICAN ATTITUDES TOWARD WATER POLLUTION

Prepared for

The Natural Resources Council of America

December 1982

Conducted by

Louis Harris and Associates, Inc.

20-955 O—84——16

A WORD ABOUT THIS STUDY

The purpose of this study was to determine the set of attitudes of the American public on the conservation of water resources. Of necessity, a major part of the focus was to measure and to analyze how concerned people are about water pollution and the role of governmental efforts to clean it up. Such areas as water pollution by toxic substances from factories, water pollution by industry, disposal of hazardous waste, contaminated drinking water, water shortages, pollution of lakes and rivers by sewage all were probed in considerable depth.

Yet, another central focus was on the renewal of the Clean Water Act, which must come up for consideration in 1983 in the Congress -- whether current water pollution standards are too protective or not protective enough, whether the original Act should be made less strict or more strict.

Specifically, the study dealt with central problems of the best available system requirements now in the law. Questions were asked if all factories should be required to install the best anti-pollution systems available or only the best affordable system, or allowing a best available technology (BAT) exception if a company might face a shutdown if required to abide by current BAT standards. Trade-offs were asked about BAT requirements vs. sewer jobs, the implications of BAT requirements in health terms vs. losing jobs, shutting down plants, or forcing companies to lose money.

Finally, the issue of keeping the deadline for BAT conformity to the original 1984 or extending it to 1987 was tested. The question of putting cost limits and constraints on water pollution clean-up efforts was dealt with in considerable depth.

In the area of drinking water, the public was asked to assess the safety of its own supply, whether water in their own area was getting safer, and whether cost considerations should be taken into account in dealing with contaminants of water supplies.

People were also asked about the necessity of making a trade-off between economic recovery and jobs for the unemployed, on the one hand, and keeping a tough program of cleaning up water pollution on the other. A test was conducted to determine how much more in taxes people are prepared to pay in order to make sure streams, lakes and rivers are kept clean and safe.

Another key area of inquiry dealt with federal wetlands policies and laws, the importance of preserving wetlands, and making current laws stricter or less strict. In the case of wetlands policy and general enforcement of anti-pollution standards or water, people were asked whom they trust more -- federal or state and local government.

Finally, measurements were taken on the involvement of people in fishing, swimming, sailing or boating, hunting, and just spending time near streams, lakes, or rivers. People were also asked about their membership in and contributions to environmental organizations.

In its planning and execution, this study was conducted from June through November, 1982. Two samples of 1,253 and 1,250 adults were used to ask the full roster of questions. Both samples were drawn on identical terms,

using telephone probability samples in which each residential household in the country had an equal chance of being drawn in the sample. Respondents in each household were selected on a random basis, so that each adult would have an equal chance of participating in the survey. A minimum of four call-backs were made for each person selected in the sample, as a means of recovering over 90% of the originally drawn probability sample.

This survey was paid for jointly by the Rockefeller Brothers Fund, the Natural Resources Council of America, and the American Fishing Tackle Manufacturers' Association.

1. ATTITUDES TOWARD WATER POLLUTION

Pollution and the Quality of Life

Since 1976, the Harris firm has asked the American people how important a variety of factors are in improving the quality of life in the United States. Not surprisingly, controlling crime and curbing inflation have regularly come out on top of the list. But curbing water pollution has also always been rated "very important" by 70 percent or more of the public, and this year is no exception. Indeed, the 74 percent who now say that "curbing water pollution" is a very important quality of life issue is identical to the proportion who say that "keeping the economy growing" is very important, and higher than the importance given to curbing air pollution, making products and services safer, and producing more energy.

Observation:

By any measure, the issue of water pollution control has a high priority among the American people. Any contention that it is a peripheral or side issue with the public simply is a mistaken claim.

The following table gives a full run-down on all of the issues asked of the cross-section:

IMPORTANCE OF VARIOUS FACTORS IN
IMPROVING THE QUALITY OF LIFE IN AMERICA

Q.: I would like to read you some factors that can affect the quality of life in this country. As far as you are personally concerned, for each of these, would you tell me if it is very important in making the quality of life better, only somewhat important, or hardly important at all in making the quality of life better?

BASE: 1253	VERY IMPORTANT %	ONLY SOMEWHAT IMPORTANT %	HARDLY IMPORTANT AT ALL %	NOT SURE %
CONTROLLING CRIME	93	6	*	1
CURBING INFLATION	83	15	1	1
BRINGING INTEREST RATES DOWN	79	18	2	1
CURBING WATER POLLUTION	74	22	3	1
KEEPING THE ECONOMY GROWING	74	20	3	3
CURBING AIR POLLUTION	72	24	4	*
MAKING PRODUCTS AND SERVICES SAFER	68	27	4	1
PRODUCING MORE ENERGY	65	27	5	3

*LESS THAN 0.5%.

Concern Over Specific Environmental Problems

The overall concerns people have about air and water pollution control finds specific application in a whole roster of specific worries:

-- By 95-4%, people feel that disposal of hazardous wastes is a serious problem in America.

-- By 93-6%, an almost identical majority feels that pollution of lakes and rivers by toxic substances from factories is a serious national problem.

-- By 88-10%, another sizable majority views pollution of lakes and rivers by sewage as a serious problem in this country.

-- By 84-14%, a big majority feel that contaminated drinking water is a serious national problem.

-- By 88-11%, a decisive majority believe that air pollution by industry generally is a serious problem in this country.

-- By 73-24%, a clear majority feel that water shortages are a serious problem in America.

-- By 80-18%, a substantial majority is convinced that air pollution by trucks and automobiles is a serious national problem.

-- By 70-25%, a majority feel that air pollution by coal-burning electric power plants is a serious problem in the nation.

-- By 61-28%, most Americans feel that damage to the landscape by coal strip mining constitutes a serious national problem.

Observation:

By clear margins, solid majorities of the American people view all nine of the environmental issues tested as serious problems. Whether tested generally or specifically, concern over the environment must be viewed as high. Four of the nine emerge as particularly urgent and serious: disposal of hazardous wastes (seen as "very serious" by 74%), pollution of lakes and rivers by toxic substances from factories ("very serious" to 65%), pollution of lakes and rivers by sewage ("very serious" to 62%), and contaminated drinking water ("very serious" to 56%).

The survey asked the following question:

SERIOUSNESS OF VARIOUS ENVIRONMENTAL PROBLEMS

Q.: I'm going to read you some different kinds of environmental problems. For each of these would you please tell me if it is currently a very serious problem, a somewhat serious problem, only a small problem, or no problem at all in this country.

BASE: 1253	VERY SERIOUS %	SOMEWHAT SERIOUS %	ONLY A SMALL PROBLEM %	NO PROBLEM AT ALL %	NOT SURE %
DISPOSAL OF HAZARDOUS WASTES	74	21	4	*	1
POLLUTION OF LAKES AND RIVERS BY TOXIC SUBSTANCES FROM FACTORIES	65	28	5	1	1
POLLUTION OF LAKES AND RIVERS BY SEWAGE	62	26	8	2	2
CONTAMINATED DRINKING WATER	56	28	12	2	2
AIR POLLUTION BY INDUSTRY	49	39	10	1	1
WATER SHORTAGES	36	37	17	7	3
AIR POLLUTION BY TRUCKS AND AUTOMOBILES	33	47	15	3	2
AIR POLLUTION BY COAL-BURNING ELECTRIC POWER PLANTS	27	43	21	4	5
DAMAGE TO THE LANDSCAPE BY COAL STRIP-MINING	26	35	21	7	11

*LESS THAN 0.5%.

Significantly, all nine of the environmental problems are viewed as basic national concerns of the American people. Toxic waste pollutants anywhere in the U.S. obviously are thought to be a frightening problem of national concern. The survey asked about four of the problem in the areas where people themselves live. A substantial 46% feel pollution of lakes and rivers where they live as a serious problem, 44% feel pollution of lakes and rivers by toxic substances is serious in their area, 33% report being worried that their own drinking water is contaminated, and 28% believe they are beset with water shortages in their area.

Observation:

The fact that minorities see these problems as serious in their area should not be taken to mean that the problems are therefore not serious for the nation. Obviously, when problems as serious as these are believed to exist in their home areas, then it is a matter requiring urgent attention. The real worry people have is a sense of shock that they exist anywhere in the U.S. and the overhanging concern that their area could be afflicted by them.

In addition, when asked if over the past ten years their own streams, lakes, and rivers are more or less polluted, a 46% plurality report they are more polluted, only 17% less, and 30% the same. When asked how they will be ten years hence, 44% think their own streams, lakes, and rivers will be more polluted, only 17% believe they will be less polluted, while 34% anticipate no real change.

Observation:

These results can only underscore the concern the American people have that the streams, rivers, and lakes where they live are threatened and strict environmental measures must be taken to keep them clean or to clean them up.

2. THE CLEAN WATER ACT: AN OVERVIEW

The Clean Water Act (officially known as the Federal Water Pollution Control Act) was passed in 1972, amended in 1977, and is subject to reauthorization (and possible amendment) this year and next. The Act establishes national water quality standards and various requirements for cities, towns, and industries to meet these standards. What follows is an attempt to measure public sentiment toward major provisions of the Act and major changes that have been proposed for the Act. This survey and analysis should not be viewed as a compilation of the public's answers to questions that require technical expertise or detailed knowledge. Rather, it should be regarded as a measurement of the strength of the public's commitment to cleaning up and preventing water pollution.

Perception of Current Federal Water Pollution Standards

When asked to rate existing federal water pollution standards, 46 percent of the public say they are "not protective enough," 41 percent say they are "just about right," and only a small 6 percent rate them "overly protective." This clear sentiment for strict water pollution standards is also reflected in public attitudes toward the Clean Water Act specifically. Although those surveyed were asked to consider "the costs involved in cleaning up the environment," a 60 percent majority nonetheless insisted that "Congress

should make the Clean Water Act stricter than it is now." Thirty-four percent feel Congress should keep the Act "about the same," and an almost nonexistent 3 percent want it made "less strict." Thus, an almost unanimous 94-3 percent of the American people believe the Clean Water Act should be kept as it is or made even stricter. Above all, they do not want the Act made less strict.

The following questions were asked:

PROTECTIVENESS OF FEDERAL WATER POLLUTION STANDARDS

Q.: Do you think that federal water pollution standards are overly protective of people's health, not protective enough, or just about right?

	1982 %	1981 %
OVERLY PROTECTIVE	4	6
NOT PROTECTIVE ENOUGH	59	48
JUST ABOUT RIGHT	34	43
NOT SURE	3	13

CHANGING THE CLEAN WATER ACT

Q.: This year Congress will reconsider the Clean Water Act. Given the costs involved in cleaning up the environment, do you think Congress should make the Clean Water Act stricter than it is now, keep it about the same, or make it less strict?

	1982 %	1981 %
MAKE IT STRICTER	60	52
KEEP IT ABOUT THE SAME	34	41
MAKE IT LESS STRICT	3	4
NOT SURE	3	3

A Key Goal of the Clean Water Act

One of the stated goals of the Clean Water Act is to make the nation's waters "fishable and swimmable" by 1983. While virtually no experts believe this goal can be met in the immediate future, there is disagreement over whether such a goal is ultimately realistic and achievable. As far as the public is concerned, however, the answer is clear. Asked to consider "the high cost of cleaning up the nation's waters," an overwhelming 78 percent majority of the public nonetheless believe that "America's waters can really be made safe for fishing and swimming," while only 17 percent "don't really think that can be done." This represents an article of faith that American technology and know-how can solve the problem of water pollution, and also implicitly demonstrates the public's commitment to the goal of making all of America's lakes and rivers fishable and swimmable.

Observation:

By any measure, there can be little doubt from these results of the determination and insistence of the American people to sustain and to continue the Clean Water Act. Any easing or weakening of the Act will be viewed as a violation of a clearly expressed public mandate.

3. THE BEST-AVAILABLE-TECHNOLOGY REQUIREMENT

The Public Commitment to BAT

One of the 1977 amendments to the Clean Water Act specifies that factories must install the best available pollution control technology (BAT) by 1984. Some industries would like to change the Act so that the government could grant waivers or variances from the BAT requirement under certain circumstances. Although the BAT requirement is complex, it is possible to measure the public's basic commitment to this requirement. Those surveyed were asked to consider the high cost of the BAT requirement, and then given a choice as to how strictly the government should enforce it.

The cross-section was asked:

ATTITUDES TOWARD THE BAT REQUIREMENT

Q.: The Clean Water Act now requires factories to install the latest, most effective systems available to clean up their toxic pollutants. Given the high cost of meeting this requirement, which one of the following policies do you think the government should follow?

	%
REQUIRE ALL FACTORIES TO INSTALL THE BEST ANTI-POLLUTION SYSTEMS AVAILABLE	53
REQUIRE ALL FACTORIES TO INSTALL THE BEST ANTI-POLLUTION SYSTEM AVAILABLE, EXCEPT THOSE FACTORIES WHICH WOULD BE FORCED TO SHUT DOWN AS A RESULT	23
REQUIRE ALL FACTORIES TO INSTALL THE BEST ANTI-POLLUTION SYSTEMS THEY SAY THEY CAN AFFORD	21
NOT SURE	3

Fully 53 percent of those surveyed -- a majority of the American people -- feel so strongly about the need to control and prevent water pollution that they are willing to endure factories being shut down and people thrown out of work rather than allow factories waivers or variances from the BAT requirement. An additional 23 percent believe that only a factory which would otherwise have to close down should be granted a variance from BAT. Only 21 percent are willing to allow businesses to decide for themselves what pollution control systems they can afford -- a sign of both public mistrust of business and a strong commitment to strict anti-pollution requirements.

Rather than rely on the results of the single question mentioned above, the survey went further and forced people to make a direct choice between strict BAT requirements and jobs. When asked, "Do you think factories should be required to install the best anti-pollution systems available even if this meant that fewer jobs would be available, or not?", a clear 65-27 percent majority said BAT should still be required. In the Midwest, hardest hit by the current recession, a slightly lower 59-33 percent favor keeping BAT over jobs. In the West, an overwhelming 75-18 percent oppose BAT variances even when jobs will be lost. People of all income groups favor strict BAT enforcement over jobs by margins of 2 to 1 or more. Union members come down on the side of BAT by 65-28 percent, and skilled laborers opt for BAT by 73-21 percent.

The survey then tested the trade-off yet a third time, offering people a choice between waiving BAT for toxic pollutants or causing the company involved to lose money, shut down the factory, and lay off workers. By an overwhelming 86-12 percent, people said that the waiver or variance should not be granted. Where toxic pollutants are concerned, the American people thus

say they are willing to sacrifice factories and jobs in order to keep the water clean and safe.

The 1977 amendments to the Clean Water Act require all industries to be in compliance with BAT standards by 1984. However, to date the government has only issued a few of these industry standards, and virtually all experts agree that the deadline must be extended -- to 1987 or 1988 at least -- in order to give the Environmental Protection Agency more time to research and set BAT standards, and in order to give industry time to comply with the new regulations. Nonetheless, the public opposes, by 57-37 percent, extending the deadline to 1987.

Observation:

This opposition should not be interpreted as an unreasonable demand made by an uninformed populace. Rather, it is a measure of the strong feeling that exists throughout the country for immediate action against water pollution. People clearly want the government to act as quickly as possible in setting BAT standards, and they are not willing to give industry much time at all to comply with the regulations.

4. COST-BENEFIT ANALYSIS

Opposition to Requiring Cost-Benefit Analysis

The Clean Water Act, unlike the Clean Air Act, does permit the government to consider costs when setting water pollution standards for industries and municipalities. However, some industries have proposed that the Act be changed so as to require more strict cost-beneift analysis before the government issues standards. The public, by 74-23 percent, opposes such a change in the Clean Water Act:

OPPOSITION TO COST-BENEFIT ANALYSIS

Q.: Some people feel that the government should not order industries to clean up their water pollution unless it can be shown that the benefits of the cleanup justify the costs involved. Others disagree and say the value of eliminating unsafe pollutants in water can't be measured in dollars. Would you favor changing the Clean Water Act so that the government couldn't order an industry to clean up its water pollution if the cost didn't justify it, or would you oppose such a change in the Clean Water Act?

	TOTAL PUBLIC
	%
OPPOSE CHANGING	74
FAVOR CHANGING	23
NOT SURE	3

This opposition runs fairly even across all regions, income groups, occupations, and political parties.

The key to the unwillingness of the public to make trade-offs on the Clean Water Act lies in the answer to another question asked in this survey: "In order to get the economy moving again and to ease unemployment, do you think it is necessary to slow down the rate at which we clean up water pollution, or do you think we can get the economy going again and also clean up water pollution?" An overwhelming 89-6% of the public feels we need not sacrifice anti-pollution efforts to help the economy improve, up from a 64-22% margin who felt the same way in response to a similar question asked during the last major recession in 1975. This means that the public by and large does not believe that a straight trade-off between economic growth and pollution control efforts is necessary or even real. Most Americans see no reason on the whole why American technology cannot accomplish both at the same time.

Observation:

The public is saying that they are not adamantly opposed to allowing the government to consider the costs of anti-pollution standards. But if cost-benefit analysis in any way results in more water pollution, then the public will strenuously oppose such consideration of costs.

20-955 O—84——17

5. SAFE DRINKING WATER

Perceptions of the Safety of Drinking Water Supplies

Although 33 percent of the public report that their area has a serious drinking water safety problem, most people are not worried about the drinking water in their own home: 50% say it is "very safe to drink," 42% "pretty safe," only 5% rate it "not very safe," and a small 2% say it is "not safe to drink at all." Fifty-nine percent of those who get their water from a well rate it very safe to drink, while 47% of those whose water comes from a municipal water system rate their water "very safe."

The public nationwide was asked:

SAFETY OF LOCAL DRINKING WATER

Q.: Now I'd like to ask you some questions about the water that comes out of the tap or faucet in your home. How would you rate the drinking water in your area -- would you say it's very safe to drink, pretty safe, not very safe, or not safe to drink at all?

	TOTAL PUBLIC %	SOURCE OF WATER: WELL %	SOURCE OF WATER: MUNICIPAL WATER SYSTEM %
VERY SAFE	50	59	47
PRETTY SAFE	42	34	46
NOT VERY SAFE	5	4	5
NOT SAFE AT ALL	2	1	2
NOT SURE	1	2	1

People are relatively confident that the drinking water in their area will remain safe for years to come. When asked to predict what their drinking water will be like in ten years, 63 percent think it will be "about as safe as it is today," 12 percent are confident it will be "safer than it is today," while 22 percent worry it will not be "as safe as it is today."

The Safe Drinking Water Act, as the Clean Water Act, is up for reauthorization in Congress this year. The Act requires that states meet national standards for drinking water purity. Currently, the federal Environmental Protection Agency (EPA) is required to regulate all contaminants that "may have any adverse effect on health." Legislation has been introduced in Congress to change this provision so that EPA may only regulate those contaminants that present "an unreasonable risk" to human health. We asked the public to consider the costs involved in the current law, and gave them a choice between the existing provision and the proposed change in the Safe Drinking Water Act. The result: by 65-33%, a 2 to 1 majority want to keep the law in its present form, regardless of the cost of meeting the existing requirements.

The cross-section was asked:

OPPOSITION TO CHANGING THE SAFE DRINKING WATER ACT

Q.: When it comes to making sure that water is safe to drink, which one of the following statements comes closer to your own point of view?

	%
CONTAMINANTS IN DRINKING WATER SUPPLIES OUGHT TO BE CLEANED UP IF THERE IS ANY CHANGE THAT THEY WILL BE DANGEROUS TO HUMAN HEALTH, REGARDLESS OF THE COST	65
CONTAMINANTS IN DRINKING WATER SUPPLIES OUGHT TO BE CLEANED UP ONLY IF THEY ARE CLEARLY DANGEROUS TO HUMAN HEALTH	33
NOT SURE	2

Observation:

In many ways, public attitudes about the Safe Water Act symbolize the fail-safe public demand that dominates across the country. Drinking water is obviously a precious commodity and even though over 9 in 10 think their supply is reasonable safe, they simply want to take no chances with contaminants of any kind that might be dangerous to human health, "regardless of cost." Basically, they want to lean over backwards and to take no chances where human health is involved. Any provision that requires proof of "clear danger" will meet with stiff public resistance.

6. THE COST OF CLEAN WATER

The Cost of the Clean Water Act

By 1987, the federal government estimates that the total cost of compliance with the current standards of the Clean Water Act will be $20.4 billion -- which works out to somewhat less than $100 for every person in the country. Obviously individuals do not bear the full cost of water pollution clean-up efforts, but consumers and taxpayers ultimately do end up paying much of the cost through higher prices in products and higher taxes. Thus, one can hear someone saying, "It's all well and good that the public wants strict anti-pollution laws and regulations, but if they aren't willing to foot the bill for these efforts, they can hardly expect to see the government keep existing laws and regulations as tough as they are now." "Furthermore," one might add, "it's easy for people to say that they are willing to see sacrifices made for the sake of cleaner water -- but they'd feel differently if they knew it meant money coming out of their pockets."

These possible views were taken into account, and people were bluntly asked if they would be willing to pay $100 a year more in taxes and higher prices for clean and safe water.

By 70-26 percent, a large majority of the American people said they'd pay the extra $100. As expected, there were differing answers according to the income of the person being interviewed -- but sizable majorities of every income, age, and occupation group said they would pay the cost of cleaning up water pollution.

WILLINGNESS TO PAY THE COST OF CLEAN WATER

Q.: Consumers and taxpayers end up paying the cost of cleaning up water pollution through higher prices on products and higher taxes. I'd like to know how much you might be willing to pay to clean up water pollution. In order to make sure that your drinking water and the streams, lakes and rivers in your area are clean and safe, would you be willing to pay 100 dollars a year more in taxes and higher prices, or not?

	YES, WOULD PAY %	NO, WOULD NOT PAY %	NOT SURE %
TOTAL PUBLIC	70	26	4
$7,500 OR LESS	54	41	5
$7,501 - $15,000	66	31	3
$15,001 - $25,000	73	24	3
$25,001 - $35,000	75	21	4
$35,001 AND OVER	84	14	2
FISHERMEN (38%)	75	23	1
SWIMMERS (40%)	77	22	1
SAILORS (42%)	77	21	2
HUNTERS (11%)	76	23	1
OTHER RECREATIONAL WATER USERS (72%)	76	22	2

Not surprisingly, people who go fishing, swimming, sailing, or hunting in or near lakes and rivers are even more willing to pay the cost of clean water than the rest of the public.

The 26 percent of the public who were not willing to pay $100 were also asked about how much more per year in taxes and higher prices they would be willing to pay to make sure their drinking water and the lakes and rivers in their area would be clean and safe. Only 11 percent of the total public said it wouldn't pay anything at all, while most of the remainder volunteered to pay various amounts in the $1-$50 range. Clearly, the public is saying it is willing to foot an even higher bill for the Clean Water Act as it now stands.

7. THE PUBLIC ASSESSES THE WETLANDS

When the 70 million acres of wetlands in the country were described to the public and the ecological balance role of wetlands were presented to the national cross-section, 83% nationwide said that it is "very important" to "keep the remaining wetlands free from further destruction."

A substantial 69% want federal standards for preserving wetlands made "more strict" and 22% want them kept as they are. Only 3% feel such standards should be made "less strict." Thus, by 91-3%, an overwhelming majority in general does not want any easing of standards for wetlands.

When asked whom they would trust more to maintain strict standards for preserving the nation's wetlands -- government officials at the federal level or those at the state and local level -- the result was a stand-off: 48-48%.

Observation:

Clearly, when the wetlands are explained to people, an overwhelming majority of the public nationwide wants them preserved and wants no easing of federal standards over their fate. One would think, therefore, that in turn, the public would favor continuance and even strengthening of federal authority. However, the flatfooted 48-48 percent tie on trusting federal officials or their state and local counterparts raises some interesting further questions.

For many years, it has been assumed in the environmental area that advocacy of federal authority on standards and enforcement meant standing for tough and strict rules governing pollution. Advocacy for state and local control, favored by many industry groups and those who opposed the Clean Air and Clean Water Acts, was taken to mean more variable standards and more diffused enforcement.

In this survey, these assumptions may well be cast in doubt. For example, by 55-41%, men who are less inclined toward tougher environmental controls, favor federal rather than state and local enforcement of wetlands standards. On the other hand, women, who are much more pro-environmental controls, favor state and local control by 56-40%. Conservatives favor federal controls, while moderates favor state and local control over wetlands. People in the South, where environmental concerns are not as high as in other regions, favor federal enforcement, while people in the West, where support for tough environmental standards is highest, support state and local control by 51-43%.

The answer obviously lies in the perceived changing role of the federal government under the Reagan administration, most particularly the stands of Interior Secretary James Watt, and EPA Administrator Anne Gorsuch. Both are widely viewed as wanting to ease strict enforcement of environmental controls. Indeed, when voters were asked who would better protect the environment, Democrats win over Republicans by 64-20%.

It is evident that the American people want strict environmental controls, but also are fearful that those now vested with responsibility over setting and enforcing standards are quite dedicated to doing just the opposite. In turn, this has mooted and clouded any clear-cut choice in the federal vs. state and local control issue. Obviously, the public would like to have continuation of federal controls but is worried that those now in authority will not enforce either the spirit or the letter of the law.

8. DIVISIONS OVER CLEAN WATER

Group Differences on Water Pollution Concerns

The results to most of the questions in this survey reveal strong support across all demographic groups for existing strict water pollution controls and standards. But there are some subgroups which -- when compared with the total public -- are consistently more concerned about environmental problems, more supportive of strict standards and controls, and less willing to trade cleaner water in for jobs or economic growth. Specifically, in their responses to virtually every question in this survey, women take a stronger pro-environment position than men, city residents are more pro-environment than suburban and rural residents, blacks more pro-environment than whites, Democrats more pro-environment than Republicans, and Westerners more pro-environment than Southerners, Midwesterners, and -- on many questions -- Easterners. Younger people tend to be more supportive of strict environmental controls than older people, but their differences with their elders are not nearly as great as the differences between the groups mentioned above.

That blacks take a stronger pro-environment position than whites is not so surprising, given that the majority of blacks are city dwellers, and cities tend to have more environmental problems than rural ones. Most blacks and more city residents are Democrats, partially explaining the difference between Democrats and Republicans. But the differences between Westerners and others, and between women and men, are significant. Westerners feel strongly about these issues in all likelihood because many of them are accustomed to wide open spaces and exposure to their natural environment. They are deeply "conservative" on environmental issues in that they clearly want to conserve the beauty and pristine quality of their natural surroundings. Women are more concerned about the environmental in part as a "quality of life" issue. Twelve percent more women than men think curbing water pollution is "very important" in improving the quality of life in this country, and women are far more concerned than men are about a whole host of environmental problems asked about in this survey.

TABLE 1

IMPORTANCE OF VARIOUS FACTORS IN
IMPROVING THE QUALITY OF LIFE IN AMERICA

Q.: I would like to read you some factors that can affect the quality of life in this country. As far as you are personally concerned, for each of these, would you tell me if it is very important in making the quality of life better, only somewhat important, or hardly important at all in making the quality of life better?

	VERY IMPORTANT %	ONLY SOMEWHAT IMPORTANT %	HARDLY IMPORTANT AT ALL %	NOT SURE %

TABLE 20

HOW IMPORTANT TO KEEP REMAINING WETLANDS FREE FROM DESTRUCTION

Q.: About 70 million acres of land in the U.S. are wetlands. Wetlands are freshwater marshes and wet meadows. When left alone and not drained, they can produce timber, peat moss, and crops such as rice and cranberries. They are also important spawning sites for fish and wildlife and are sanctuaries for fish and bird life. They also help protect against storm and flood waters. Half the wetlands in the U.S. have been drained and destroyed by companies seeking land for industry, and for roads and ports. Now the country has to decide what to do with the remaining wetlands which are vital to the survival of fish and wildlife. How important do you feel it is to keep the remaining wetlands free from further destruction -- very important, somewhat important, or not very important?

	TOTAL PUBLIC %

TESTIMONY OF DANIEL WEISS

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE:

MY NAME IS DANIEL WEISS, AND I AM A CONSERVATION ASSOCIATE SPECIALIZING IN WATER ISSUES WITH THE IZAAK WALTON LEAGUE OF AMERICA. IT IS A PLEASURE TO APPEAR BEFORE YOU BRIEFLY THIS MORNING TO COMMENT ON THE CLEAN WATER ACT, A LAW THAT IS VITAL TO OUR NATION'S EFFORTS TO CLEAN UP OUR RIVERS, LAKES, BAYS AND ESTUARIES. THE IZAAK WALTON LEAGUE IS A NATIONAL CONSERVATION ORGANIZATION LONG DEDICATED TO THE PRINCIPLES EMBODIED IN THE CLEAN WATER ACT. CLEAN WATER REMAINS A HIGH PRIORITY OF THE 50,000 FISHERMEN, HUNTERS, AND CONSERVATIONISTS WHO ARE MEMBERS OF THE IZAAK WALTON LEAGUE.

TODAY, I WOULD LIKE TO ADDRESS TWO ISSUES FACING CONGRESS AS IT CONSIDERS THE REAUTHORIZATION OF THE CLEAN WATER ACT. ONE ISSUE INVOLVES MAINTAINING A CRITICAL ELEMENT OF THE ACT'S EXISTING PROTECTIONS WHILE THE OTHER INVOLVES A POLLUTION PROBLEM THAT THE ACT DOES NOT ADEQUATELY ADDRESS. THE FORMER INVOLVES THE REAGAN ADMINISTRATION'S PROPOSALS TO WEAKEN THE FEDERAL REGULATIONS GOVERNING THE STATE WATER QUALITY STANDARDS. THE NEW PROBLEM IS HOW TO CLEAN UP "TOXIC HOT SPOTS"--WATERS THAT WILL STILL BE UNFIT FOR FISHING OR SWIMMING EVEN AFTER ALL OF THE ACT'S EXISTING CONTROLS ARE PUT IN PLACE BECAUSE OF HIGH LEVELS OF TOXIC DISCHARGES.

MEMBERS OF THE HOUSE PUBLIC WORKS COMMITTEE HAVE BEEN INSTRUMENTAL IN RAISING CRITICAL CONCERNS ABOUT BOTH OF THESE

ISSUES. CHAIRMAN ROE HAS REPEATEDLY VOICED HIS CONCERN THAT THE PROPOSED WATER QUALITY STANDARDS WOULD UNDERMINE STRONG STATE CLEAN WATER PROGRAMS AND INHIBIT THE ACHIEVEMENT OF THE GOALS OF THE ACT. THE HEARING THAT THIS SUBCOMMITTEE HELD LAST FEBRUARY WITH THEN-EPA ASSISTANT ADMINISTRATOR EIDSNESS WAS CRITICAL IN EXPOSING THE MYRIAD OF PROBLEMS WITH EPA'S PROPOSED REGULATIONS. HR 3282, SPONSORED BY CHAIRMAN HOWARD AND OTHER MEMBERS OF THIS COMMITTEE, WOULD SOLVE BOTH OF THESE PROBLEMS BY INCORPORATING THE KEY PRINCIPLES OF THE EXISTING WATER QUALITY REGULATIONS INTO THE ACT, AND BY REQUIRING EPA TO IDENTIFY AND CLEAN UP TOXIC HOT SPOTS. YOUR LEADERSHIP ON THESE ISSUES HAVE PROVEN CRITICAL TO MAINTAINING AND STRENGTHENING THE CLEAN WATER ACT.

THE CLEAN WATER ACT, PASSED IN 1972, GAVE THE FEDERAL GOVERNMENT PRIMARY RESPONSIBILITY FOR SETTING, IMPLEMENTING, AND ENFORCING WATER POLLUTION CONTROLS. AS A RESULT OF THE ACT, CONTROLS ARE NO LONGER BASED ON A CASE-BY-CASE EVALUATION OF THE EFFECTS OF PARTICULAR POLLUTANTS ON A PARTICULAR STREAM--THE "WATER QUALITY" APPROACH. INSTEAD, UNIFORM MINIMUM LIMITATIONS ON DISCHARGES ARE TO BE SET FOR EACH MAJOR POLLUTING INDUSTRY. THESE UNIFORM STANDARDS ELIMINATE MANY OF THE INEQUITIES AND UNCERTAINTIES OF THE WATER QUALITY SYSTEM. THE NATIONWIDE PROGRAM HAS ENABLED MANY STATES--INCLUDING MINNESOTA, CALIFORNIA, NEW JERSEY, AND MARYLAND--TO DEVELOP AND IMPLEMENT TOUGH CLEAN WATER PROGRAMS WITHOUT FEAR OF LOSING INDUSTRY TO STATES WITH WEAKER PROGRAMS.

THE CLEAN WATER ACT HAS LED TO THE CLEAN UP OF SOME OF OUR MOST POLLUTED WATERS IN THE NATION, INCLUDING THE ST. LOUIS RIVER IN MINNESOTA, THE POTOMAC RIVER, AND THE HUDSON RIVER. NATIONWIDE, THE DEGRADATION OF OUR WATERS HAS HALTED AND POLLUTION LEVELS HAVE REMAINED THE SAME DESPITE A GROWING POPULATION AND ECONOMY.

MOST OF THESE SUCCESSES INVOLVE CLEANING UP CONVENTIONAL POLLUTANTS SUCH AS SUSPENDED SOLIDS, OIL, GREASE, AND OTHERS. PROBLEMS WITH TOXIC CHEMICALS--THE INVISIBLE KILLERS IN OUR WATERS--PERSIST. ALTHOUGH MANY WATERS THAT ONCE WERE LITTLE MORE THAN OPEN SEWERS ARE NOW CLEAN ENOUGH FOR FISH TO SURVIVE, IN SOME OF THESE WATERS, THE FISH ARE CONTAMINATED BY TOXICS AND ARE UNFIT FOR HUMAN CONSUMPTION. WE STILL HAVE A LONG WAY TO GO BEFORE WE HAVE RESTORED OUR WATERS AND MET THE GOALS OF THE CLEAN WATER ACT.

* * * * * *

THE CLEAN WATER ACT WAS DESIGNED TO CONTROL POLLUTION IN TWO WAYS. IN ADDITION TO THE UNIFORM EFFLUENT LIMITATIONS, STATES ARE REQUIRED TO SET "WATER QUALITY STANDARDS," WHICH ESTABLISH LIMITS ON POLLUTION FOR SPECIFIC BODIES OF WATER, BASED ON THEIR OPTIMUM USE. WATERS DESIGNATED FOR USES THAT REQUIRE HIGH QUALITY WATERS--SUCH AS TROUT FISHING--ARE REQUIRED TO BE KEPT CLEANER THAN WATERS TO BE USED FOR LOW-QUALITY USES, SUCH AS NAVIGATION.

THESE STATE STANDARDS CAN BE USED AS A SECOND LINE OF DEFENSE IN ACHIEVING CLEAN WATER BY REQUIRING ADDITIONAL POLLUTION CONTROLS WHEN THE MINIMUM FEDERAL EFFLUENT LIMITATIONS FOR EACH OF THE MAJOR POLLUTING INDUSTRIES ARE INADEQUATE TO ACHIEVE CLEAN WATER.

ON OCTOBER 29, 1982, THE ENVIRONMENTAL PROTECTION AGENCY PROPOSED CHANGES IN THESE REGULATIONS THAT COULD HALT, AND PERHAPS REVERSE, TEN YEARS OF PROGRESS IN RESTORING AND PROTECTING OUR WATERS. THESE PROPOSALS ALSO THREATEN FUTURE EFFORTS TO CONTROL DEADLY TOXIC DISCHARGES.

THE IZAAK WALTON LEAGUE OPPOSES THE EPA'S PROPOSALS TO ALTER THE EXISTING REGULATIONS BECAUSE THEY WOULD:

- ELIMINATE MANDATORY STATE REVIEW OF ALL WATER QUALITY STANDARDS;
- ALLOW STATES TO "DOWNGRADE" OR WEAKEN WATER QUALITY STANDARDS MORE EASILY;
- LIMIT THE "ANTI-DEGRADATION POLICY" TO THE PROTECTION OF EXISTING USES ONLY;
- ALLOW "VARIANCES", OR EXEMPTIONS, FOR HEAVILY POLLUTING PLANTS FROM NEEDED POLLUTION CONTROLS; AND
- REDUCE OPPORTUNITIES FOR PUBLIC PARTICIPATION IN STATE CLEAN WATER PROGRAMS.

TOGETHER, THESE PROPOSALS SIGNAL A MAJOR RETREAT FROM MEETING THE GOALS OF THE CLEAN WATER ACT. I WOULD LIKE TO COMMENT BRIEFLY ON THESE PROPOSALS.

PRIORITY REVIEW OF STANDARDS

EPA'S REGULATORY PROPOSALS ELIMINATE BY ADMINISTRATIVE FIAT THE CLEAN WATER ACT REQUIREMENT THAT STATES REVIEW, AND REVISE AS NEEDED, THEIR WATER QUALITY STANDARDS. (CLEAN WATER ACT, SECTION 303(c)(1).) INSTEAD, STATES CAN SELECT "PRIORITY WATER BODIES OR SEGMENTS FOR REVIEW". STATES, UNDER PRESSURE FROM HEAVY DISCHARGERS, COULD LEGALLY AVOID REVIEWING STANDARDS AND CONTROLS ON THE STREAMS WHERE THE DISCHARGERS ARE CAUSING SERIOUS POLLUTION PROBLEMS. STANDARDS ON NON-REVIEWED STREAMS WOULD NOT BE UPGRADED EVEN IF SUCH STREAMS BECOME CLEANER SINCE THE STANDARDS WERE LAST REVIEWED. FINALLY, NEW SCIENTIFIC INFORMATION ABOUT WATER QUALITY WOULD ONLY BE INCORPORATED INTO THE WATER QUALITY STANDARDS OF STREAMS THAT WERE REVIEWED.

IN MANY STATES, THE MANDATORY THREE YEAR REVIEW OF STANDARDS HAS PROVIDED US THE OPPORTUNITY TO EVALUATE OUR CLEAN WATER PROGRAM, AND IDENTIFY AND ADDRESS PROBLEM STREAM SEGMENTS.

DOWNGRADING WATER QUALITY STANDARDS

NEARLY ALL OF THE NATION'S WATERS ARE DESIGNATED FOR FISHING, SWIMMING, OR RECREATION. FORTY OF THE 50 STATES CLASSIFY ALL OF THEIR WATERS FOR FISHING OR SWIMMING. NEARLY ALL OF THE WATERS IN THE OTHER TEN STATES ARE SIMILARLY CLASSIFIED; ONLY A FEW WATERS IN EACH OF THESE STATES ARE CLASSIFIED FOR SOME LOWER QUALITY USE.

MEETING THESE USES WILL BE BENEFICIAL BECAUSE MANY PEOPLE DEPEND ON FISHING, BOATING, AND OTHER WATER ACTIVITIES FOR THEIR LIVELIHOOD OR RECREATION. ADDITIONALLY, MEETING THESE USES WILL INDICATE THAT WE ARE ACHIEVING OUR ULTIMATE OBJECTIVE TO "RESTORE AND MAINTAIN THE CHEMICAL, PHYSICAL, AND BIOLOGICAL INTEGRITY OF THE NATION'S WATERS". (CLEAN WATER ACT, SECTION 101(a).)

THE CURRENT RULES REQUIRE A STATE TO MAINTAIN EXISTING WATER QUALITY STANDARDS UNLESS IT DEMONSTRATES THAT A STREAM'S DESIGNATED USE CANNOT BE MET BECAUSE THE STREAM IS HOPELESSLY POLLUTED, OR REQUIRING THE CONTROLS NEEDED TO MEET THE USE WOULD CAUSE SUBSTANTIAL AND WIDESPREAD ECONOMIC AND SOCIAL IMPACT.

EPA'S PROPOSALS WOULD REPLACE THESE SIMPLE, STRAIGHTFORWARD RULES WITH REQUIREMENTS FOR DOWNGRADING THAT ARE VAGUE, OPEN-ENDED, AND IN SEVERAL CASES, UNRELATED TO WATER QUALITY. EPA'S PROPOSED REGULATIONS WOULD ALLOW STATES TO PERMANENTLY DOWNGRADE STANDARDS AND ALLOW MORE POLLUTION IF:

- ABNORMALLY LOW STREAM FLOWS DURING A DRY SPELL CAUSE TEMPORARY REDUCTIONS IN FISH POPULATIONS;
- A STREAM DESIGNATED FOR SWIMMING IS TOO SHALLOW TO ACTUALLY SWIM IN; OR
- THE BENEFITS OF MEETING A STANDARD "DO NOT BEAR A REASONABLE RELATIONSHIP TO THE COSTS".

RATHER THAN GOING TO THE TROUBLE OF REQUIRING THE CLEAN UP FOULED STREAMS, STATES COULD INSTEAD EASILY DOWNGRADE STANDARDS, THEREBY DEFINING AWAY POLLUTION PROBLEMS.

EPA CLAIMS THAT THESE CHANGES ARE NEEDED BECAUSE SOME STATES ADOPTED WATER QUALITY STANDARDS THAT WERE UNREASONABLY STRICT AND COSTLY, AND WANTS TO ALLOW STATES TO WEAKEN THESE STANDARDS TO ALLOW MORE POLLUTION IN THE WATERS. EPA HAS YET TO DEMONSTRATE ACTUAL INSTANCES WHERE THE EXISTING REGULATIONS HAVE BEEN INFLEXIBLE AND HAVE PREVENTED A STATE FROM DOWNGRADING A STANDARD THAT COULD NOT BE MET. IN FACT, UNDER THE EXISTING REGULATIONS, MINNESOTA HAS RECENTLY DOWNGRADED 208 STREAM SEGMENTS, COVERING APPROXIMATELY 800 MILES, BECAUSE THE STATE BELIEVED THAT THEY COULD NEVER BECOME FISHABLE OR SWIMMABLE. IF EPA PERMITS THIS AMOUNT OF DOWNGRADING OF STANDARDSS NOW, WE CAN EXPECT MUCH MORE DOWNGRADING UNDER THESE PROPOSALS. THIS WOULD REWARD STATES AND INDUSTRIES THAT HAVE DONE A POOR JOB OF CLEANING THEIR WATERS. EPA'S DOWNGRADING PROPOSAL MAKES ACHIEVING THE FISHABLE, SWIMMABLE GOAL OF THE ACT MORE DIFFICULT.

SIGNIFICANTLY, EPA WOULD ALSO ELIMINATE THE REQUIREMENT THAT STATES MUST UPGRADE, OR STRENGTHEN, WATER QUALITY STANDARDS IF A STREAM IS MEETING A HIGHER USE THAN THE STANDARD REQUIRES. FOR INSTANCE, MINNESOTA IS EVALUATING WHETHER TO UPGRADE THE WATER QUALITY STANDARD OF THE ONCE-POISONED ST. LOUIS RIVER. ELIMINATING THE MANDATORY UPGRADING PROVISION COULD PUT AN END TO THIS EFFORT TO ENSURE THAT CURRENT IMPROVEMENTS IN WATER QUALITY BECOME PERMANENT.

LIMITING THE ANTI-DEGRADATION POLICY

EPA'S PROPOSALS WOULD CURTAIL PROTECTIONS FOR HIGH QUALITY WATERS--INCLUDING OUTSTANDING NATIONAL RESOURCE WATERS SUCH AS THOSE IN PARKS AND WILDLIFE REFUGES--THAT ARE CLEANER THAN THE STRICTEST WATER QUALITY STANDARDS REQUIRES. THESE WATERS COULD BE POLLUTED SO LONG AS THE EXISTING USES WERE STILL MET. THIS CHANGE IN "ANTI-DEGRADATION" RULES WOULD ENCOURAGE STATES TO STRIVE FOR ONLY THE MINIMUM LEVEL OF POLLUTION CLEAN UP NEEDED TO MEET WATER QUALITY STANDARDS.

CURRENTLY, ONLY NINE STATES HAVE ANY DESIGNATED OUTSTANDING NATIONAL RESOURCE WATERS, AS PROVIDED FOR IN THE EXISTING REGULATIONS. OTHER STATES ARE CURRENTLY DEVELOPING PROTECTIONS FOR SUCH WATERS IN THEIR STATES. THIS TYPE OF PROGRAM ENSURES THAT THESE OUTSTANDING WATERS REMAIN CLEAN, AND OTHER IMPROVEMENTS IN WATER QUALITY ARE NOT LOST. YET THESE PROGRAMS COULD BE JEOPARDIZED IF EPA'S REGULATIONS NO LONGER REQUIRE THEM. A STRONG FEDERAL ANTI-DEGRADATION POLICY IS A CORNERSTONE OF THE ACT'S OBJECTIVE TO RESTORE, PROTECT, AND MAINTAIN OUR NATION'S WATER QUALITY.

PUBLIC PARTICIPATION WOULD BE CURTAILED

THIS COMMITTEE WISELY DESIGNED THE CLEAN WATER ACT TO ALLOW THE PUBLIC TO PARTICIPATE IN NEARLY EVERY PART OF THE PROGRAM. EPA'S

20-955 O—84——19

PROPOSED REGULATIONS ARE DESIGNED TO GREATLY REDUCE SUCH PARTICIPATION IN THE WATER QUALITY STANDARDS PROCESS. THERE WOULD BE NO REQUIRED PUBLIC INPUT WHEN STATES:

- DEVELOP SITE-SPECIFIC CRITERIA;
- SET RISK LEVELS FOR TOXIC CRITERIA;
- CONDUCT BENEFIT-COST ASSESSMENTS OF MELTING STREAM STANDARDS;
- ALLOW DEGRADATION OF HIGH QUALITY STREAMS; AND
- ISSUE VARIANCES FOR DISCHARGERS FROM ADDITIONAL CONTROLS.

STATES CAN ALTER THEIR WATER PROGRAMS IN ALL OF THESE AREAS WITHOUT PUBLIC INPUT. PUBLIC PARTICIPATION HAS LED TO INNOVATIVE, COST-EFFECTIVE, AND ENVIRONMENTALLY ENHANCED POLLUTION PROGRAMS.

* * * * * *

TAKEN TOGETHER, EPA'S PROPOSALS WOULD FUNDAMENTALLY WEAKEN STATE CLEAN WATER PROGRAMS. THE PROPOSED CHANGES IN DOWNGRADING AND ANTI-DEGRADATION REGULATIONS, COMBINED WITH THE NEW VARIANCE PROVISION, WILL GIVE RECALCITRANT INDUSTRIAL POLLUTERS INCENTIVES TO GO "POLLUTION SHOPPING"--CLOSING PLANTS IN STATES WITH TOUGH STANDARDS OR LOCATING PLANTS IN STATES WITH WEAK ONES. ECONOMICALLY HARD-PRESSED STATES THAT HAVE STRIVED TO CLEAN UP THEIR WATER COULD NOW BE FORCED TO CHOOSE BETWEEN WEAKENING THEIR

POLLUTION CONTROLS OR LOSING INDUSTRIAL JOBS.

THE PHILOSOPHY UNDERLYING EPA'S PROPOSALS IS THAT WATER POLLUTION CONTROL EFFORTS SHOULD ONLY STRIVE TO MEET WATER USES, AND NOT ACHIEVE WATER QUALITY. FOR INSTANCE, EPA ADVOCATES LIMITING THE ANTI-DEGRADATION POLICY FOR HIGH QUALITY WATERS TO "THE PROTECTION AND MAINTENANCE OF EXISTING USES". AND EPA ASSERTS THAT "THERE IS NO ACCEPTED HIERARCHY OF USES" - A POOR QUALITY USE LIKE IRRIGATION IS AS DESIRABLE AS A HIGH QUALITY USE LIKE FISHING. THIS PHILOSOPHY IS GROSSLY INCONSISTENT WITH THE CLEAN WATER ACT'S OBJECTIVE TO "RESTORE AND MAINTAIN" THE NATION'S WATERS, AND IS AT ODDS WITH THE ACT'S INTERIM GOAL OF ACHIEVING WATER QUALITY SUITABLE FOR FISHING AND SWIMMING. THE CLEAN WATER ACT IS A WATER QUALITY LAW. THE CUYAHOYA RIVER IN OHIO IS NOW MEETING ITS USE - YOU CAN CATCH FISH THERE. BUT THE RIVER STILL ISN'T CLEAN - YOU CAN'T EAT ANY OF THE FISH YOU CATCH.

THE EXISTING REGULATIONS ARE DESIGNED TO ENHANCE WATER QUALITY BY GREATLY RESTRICTING DOWNGRADING OF STANDARDS, AND BY PROTECTING HIGH QUALITY WATERS FROM DEGRADATION. IF ADOPTED, EPA'S PROPOSALS WOULD SIGNIFICANTLY LOWER THE SITES OF THE NATION'S CLEAN WATER PROGRAM. IF THAT HAPPENED, THE CLEAN WATER ACT MIGHT BE MORE APTLY CALLED THE "CLEAN ENOUGH WATER ACT".

NEW JERSEY, ALONG WITH CALIFORNIA, MINNESOTA, MARYLAND, AND OVER A DOZEN OTHER STATES (SEE ATTACHMENT #1), HAVE FOUND FAULT WITH EPA'S PROPOSALS, EVEN THOUGH THEY ARE THE SUPPOSED

BENEFICIARIES OF THE CHANGES. NEW JERSEY DETERMINED THAT EPA'S PROPOSALS "WOULD INTRODUCE UNCERTAINTIES THAT WOULD SLOW AND PERHAPS HALT MUCH OF OUR POLLUTION CONTROL EFFORTS". CALIFORNIA COMMENTED THAT EPA'S PROPOSALS WITHDRAW "SUPPORT FROM STRONG STATE PROGRAMS AND (MAKES) IT MORE DIFFICULT FOR STATES TO MAINTAIN HIGH WATER QUALITY ON THEIR OWN". MINNESOTA TOLD EPA THAT THE PROPOSED REGULATIONS WOULD "REQUIRE THE INEFFICIENT AND EXCESSIVE USE OF LIMITED STATE MONETARY AND HUMAN RESOURCES", BECAUSE UNDER THE PROPOSED RULES, STATES WOULD BE EXPECTED TO UNDERTAKE EXPENSIVE STUDIES LIKE COST-BENEFIT ASSESSMENTS.

RATHER THAN SPENDING OUR SCARCE TAX DOLLARS CONDUCTING EXPENSIVE STUDIES DESIGNED TO RATIONALIZE WEAKENING STANDARDS AND CONTROLS, WE WOULD RATHER HAVE STATES USE THEIR LIMITED RESOURCES TO DEVELOP PROGRAMS THAT ADEQUATLY IDENTIFIES, MONITORS, AND CONTROLS THE DISCHARGE OF POISONOUS INDUSTRIAL CHEMICALS INTO OUR PRICELESS RIVERS AND LAKES.

NATIONWIDE, THE LOUIS HARRIS SURVEY FOUND THAT 70 PER CENT OF THE PEOPLE POLLED WOULD PAY $100 MORE A YEAR IN TAXES AND PRICES TO CLEAN UP WATER POLLUTION (SEE ATTACHMENT #2). THE PEOPLE IN THIS COUNTRY ARE WILLING TO PAY FOR CLEAN WATER; IT'S UP TO THE CONGRESS TO MAKE SURE THAT THE EPA RESPONDS TO THIS MANDATE BY RETAINING TOUGH WATER QUALITY REGULATIONS.

HR 3282: RETAINS STRONG WATER QUALITY STANDARDS

THE EXISTING REGULATIONS HAVE PROVEN STRICT ENOUGH TO MAINTAIN STRONG STATE WATER QUALITY STANDARDS, WHILE REMAINING FLEXIBLE ENOUGH TO ALLOW NECESSARY ADJUSTMENTS IN STANDARDS. HR 3282 WOULD

INCORPORATE THE KEY PRINCIPLES OF THE EXISTING REGULATIONS IN THE ACT, ENSURING THAT THIS DELICATE --YET CRITICAL-- BALANCE IS MAINTAINED.

SPECIFICALLY, HR 3282 WOULD:

- ALLOW DOWNGRADING OF STREAM STANDARDS ONLY WHEN:
  - EXISTING STANDARDS ARE NOT ATTAINABLE BECAUSE OF "NATURAL BACKGROUND" LEVELS OF POLLUTION;
  - EXISTING STANDARDS ARE NOT ATTAINABLE BECAUSE OF "IRRETRIEVABLE, MAN-INDUCED CONDITIONS" OR
  - THE ADDITIONAL CLEANUP BEYOND BAT REQUIRED TO MEET EXISTING STANDARDS WOULD CAUSE "SUBSTANTIAL AND WIDESPREAD ADVERSE ECONOMIC AND SOCIAL IMPACT";
- REQUIRE STATES TO UPGRADE WATER QUALITY STANDARDS FOR STREAMS THAT ACTUALLY ARE CLEANER THAN REQUIRED, AND ARE MEETING A DESIGNATED USE THAT IS "HIGHER THAN THE EXISTING STANDARD;
- REQUIRE STATES TO INCORPORATE NUMERICAL TOXIC CRITERIA FOR ANY OF THE 65 PRIORITY POLLUTANTS WHICH REASONABLY COULD BE EXPECTED TO INTERFERE WITH THE ATTAINMENT OR MAINTENANCE OF THIER WATER QUALITY STANDARDS;
- PROHIBIT THE DEGRADATION OF HIGH QUALITY WATERS THAT ARE CLEANER THAN REQUIRED BY THE MOST STRINGENT WATER QUALITY STANDARDS, UNLESS THEY MUST BE DEGRADED TO ALLOW ESSENTIAL ECONOMIC OR SOCIAL DEVELOPMENT FOR WHICH THERE ARE NO FEASIBLE ALTERNATIVES. STATES MUST ENSURE THAT SUCH DEGRADATION DOES NOT INTERFERE WITH OR INJURE EXISTING DESIGNATED USES; AND
- PROTECT "OUTSTANDING NATIONAL RESOURCE WATERS"--SUCH AS THOSE IN NATIONAL PARKS AND WILDLIFE REFUGES--FROM DEGRADATION.

AS REGULATIONS, THESE REQUIREMENTS HAVE BEEN A KEY TOOL IN OUR EFFORTS TO ACHIEVE FISHABLE, SWIMMABLE WATERS.

THE REQUIREMENT IN HR 3282 THAT STATES ADOPT NUMERICAL WATER QUALITY CRITERIA FOR TOXICS IS A NEW REQUIREMENT, BUT IT IS

CONSISTENT WITH AND CRITICAL TO ACHIEVING THE GOALS OF THE ACT. CURRENTLY, ONLY ABOUT HALF OF THE STATES HAVE ANY NUMERICAL STANDARDS FOR TOXICS, AND THEY USUALLY COVER ONLY A HANDFUL OF HEAVY METALS. THESE STANDARDS RARELY CONSIDER THE CHRONIC EFFECTS OF THESE TOXICS OR THEIR EXPOSURE TO HUMANS THROUGH THE FOOD CHAIN.

FOR INSTANCE, ONLY 26 STATES HAVE NUMERICAL STANDARDS FOR LEAD, CYANIDE, AND CADMIUM. THESE ARE THREE OF THE MOST COMMONLY FOUND TOXICS IN INDUSTRIAL WASTEWATER DISCHARGED INTO OUR WATERS AND SEWERS, AND CAN CAUSE CANCER, BIRTH DEFECTS, AND OTHER HEALTH PROBLEMS IN HUMANS. FEWER THAN 15 STATES HAVE NUMERICAL STANDARDS FOR PCB'S. FEWER THAN 25 STATES HAVE NUMERICAL STANDARDS FOR MERCURY, AND ONLY NINE OF THESE HAVE STANDARDS STRINGENT ENOUGH TO PROTECT HUMAN HEALTH, BASED ON THE EPA "WHITE BOOK CRITERIA"(45 FR 79337, NOVEMBER 28, 1980). MANY OF THE STANDARDS FOR OTHER TOXICS ARE ALSO CONSIDERABLY LESS STRINGENT THAN EPA'S NATIONAL CRITERIA FOR THOSE SUBSTANCES.

INSTEAD OF NUMERICAL CRITERIA, MANY STATES EMPLOY "NARRATIVE" CRITERIA FOR TOXICS. NARRATIVE CRITERIA ARE OFTEN DIFFICULT TO TRANSLATE INTO DISCHARGE LIMITATIONS FOR PARTICULAR DISCHARGERS, AND SUCH LIMITATIONS CAN BE DIFFICULT TO ENFORCE. ADDITIONALLY, THEY ARE USELESS FOR DEVELOPING CONTROLS ON TOXICS STRICT ENOUGH TO PROTECT HUMAN HEALTH.

SOME EPA AND STATE OFFICIALS HAVE DISCUSSED THE POTENTIAL DEVELOPMENT OF TOXICS CRITERIA BASED ON BIOMONITORING. HOWEVER,

EPA STAFF HAS ADMITTED THAT SUCH TECHNIQUES HAVE NEVER BEEN USED TO ISSUE AND ENFORCE A SINGLE DISCHARGE LIMITATION, ARE USELESS FOR PROTECTION OF HUMAN HEALTH, AND HAVE NOT BEEN THOROUGHLY TESTED IN THE FIELD TO DETERMINE THEIR RELIABILITY AND DEVELOPMENT COSTS. IN SHORT, ALTHOUGH TOXICS CRITERIA BASED ON BIOMONITORING IS AN AVENUE WORTH EXPLORING, MANY MORE YEARS OF RESEARCH AND TESTING ARE NEEDED BEFORE WE SHOULD RELY ON SUCH CRITERIA TO PROTECT HUMAN HEALTH FROM THE DEADLY EFFECTS OF TOXICS. IN THE MEANTIME, THE REQUIREMENT IN HR 3282 THAT STATES ADOPT NUMERICAL CRITERIA FOR TOXICS WILL PROVIDE THE PUBLIC WITH PROTECTION FROM THEIR EFFECTS.

SINCE WILLIAM RUCKELSHAUS BECAME EPA ADMINISTRATOR IN MAY 1983, HE HAS HINTED THAT EPA MAY PROPOSE FINAL WATER QUALITY REGULATIONS THAT DO NOT INCLUDE SOME OF THE MORE UNWORKABLE, COSTLY, AND ENVIRONMENTALLY DESTRUCTIVE CHANGES PROPOSED BY THE ADMINISTRATION LAST FALL. HOWEVER, WE STRONGLY URGE THE COMMITTEE AND THE CONGRESS TO STAND FIRM IN ITS RESOLVE TO DETERMINE THE NATIONAL POLICY FOR CLEAN WATER AS PROPOSED IN HR 3282. THIS IS A NATIONAL POLICY THAT SHOULD BE ESTABLISHED BY CONGRESS, AND NOT BY UNELECTED BUREAUCRATS AT EPA OR OMB. EVEN IF MR. RUCKELSHAUS DOES PROPOSE SUCH REGULATIONS, HR 3282 WOULD PROVIDE MORE PROTECTION FOR OUR WATERS THAN THE EXISTING REGULATIONS.

FIRST OF ALL, INCORPORATING THE KEY PRINCIPLES OF THE EXISTING REGULATIONS INTO THE ACT GUARANTEES THAT EPA WILL FAITHFULLY ABIDE BY AND IMPLEMENT THE POLICIES ESTABLISHED BY CONGRESS IN

OPERATING THE WATER QUALITY STANDARDS PROGRAM. THE WRITTEN LAW IS THE MOST CLEAR AND CERTAIN STATEMENT OF CONGRESSIONAL INTENT. WHEN POLICY PRINCIPLES ARE INCORPORATED DIRECTLY INTO THE LAW, RATHER THAN JUST IN THE REGULATIONS, IT IS MUCH MORE DIFFICULT FOR THESE PRINCIPLES TO BE IGNORED BY BUREAUCRATS OR CHALLENGED BY SPECIAL INTERESTS.

EVEN IF ADMINISTRATOR RUCKELSHAUS PROPOSES FAIRLY SOUND WATER QUALITY REGULATIONS, THERE IS NO GUARANTEE THAT HE WILL BE ABLE TO GET FINAL APPROVAL FOR SUCH REGULATIONS BY OMB, OR THAT THEY WILL REMAIN IN PLACE AFTER HE IS NO LONGER EPA ADMINISTRATOR. THESE ARE REAL CONCERNS, GIVEN EPA'S ACTUAL OR ATTEMPTED RETREATS ON A NUMBER OF CLEAN WATER ACT REGULATORY AREAS, INCLUDING: PRETREATMENT REMOVAL CREDITS, ANTI-BACKSLIDING PROVISIONS FOR DISCHARGE PERMITS, AND THE TOXIC HOT SPOTS PROGRAM.

WATER QUALITY STANDARDS ARE A KEY ELEMENT OF OUR WAER POLLUTION CONTROL PROGRAMS. THEY ARE USED TO EVALUATE WATER QUALITY IN STREAMS, AND AS A TOOL TO ACHIEVE THE ACT'S GOAL OF FISHABLE, SWIMMABLE WATERS. MANY OF THE OTHER WEAKENING CHANGES IN THE ACT PROPOSED OR SUPPORTED BY THE ADMINISTRATION AND INDUSTRY, SUCH AS A BAT WAIVER OR PRETREATMENT OPT OUT, EMPLOY WATER QUALITY STANDARDS AS A TOOL TO EVALUATE WHICH DISCHARGERS OR COMMUNITIES CAN RECEIVE WAIVERS FROM THE ACT'S REQUIREMENTS. WATER QUALITY STANDARDS WILL ALSO BE A KEY PART OF ANY TOXIC HOT SPOTS PROGRAM.

THE FATE OF THESE REGUALTIONS IS TOO IMPORTANT TO BE DECIDED BY ANYONE BUT THE CONGRESS. WE HEARTILY APPLAUD CHAIRMAN ROE AND

CHAIRMAN HOWARD FOR THEIR LEADERSHIP IN OPPOSING WEAKENING CHANGES IN THE EXISTING WATER QUALITY REGULATIONS. WE STRONGLY URGE THE WATER RESOURCES SUBCOMMITTEE TO ENACT SECTION 6 OF HR 3282 BECAUSE IT STRENGTHENS THE ACT BY INCORPORATING THE KEY PRINCIPLES OF THE EXISTING REGULATIONS INTO IT. THIS LEGISLATION WILL FORCE EPA TO GET ON WITH THE JOB OF CLEANING UP OUR NATION'S WATERS RATHER THAN DELAYING PROGRESS AND WASTING MORE TIME AND MONEY TRYING TO UNDO EXISTING PROTECTIONS.

TOXIC HOT SPOTS: THE UNSOLVED THREAT

I WOULD NOW LIKE TO DISCUSS A GROWING POLLUTION PROBLEM CURRENTLY UNADDRESSED BY THE CLEAN WATER ACT THAT MUST BE SOLVED IF WE ARE TO ACHIEVE CLEAN WATER AND PROTECT THE PUBLIC FROM HAZARDS OF TOXICS. IN SOME WATERS AROUND THE NATION, BAT POLLUTION CONTROL REQUIREMENTS ALONE WILL BE INADEQUATE TO ACHIEVE FISHABLE, SWIMMABLE WATERS. THESE WATERS WILL STILL BE HEAVILY POLLUTED WITH TOXICS EVEN AFTER BAT REQUIREMENTS ARE MET BECAUSE OF THE LARGE NUMBER OF INDUSTRIAL FACILITIES THAT WILL BE DISCHARGING INTO THEM. THESE AREAS ARE CALLED "TOXIC HOT SPOTS".

IN 1981, EPA RELEASED A LIST OF 34 URBAN, INLAND AREAS THAT MIGHT HAVE HIGH LEVELS OF TOXICS IN THEIR NEARBY WATERS EVEN AFTER BAT IS IN PLACE. EPA'S LIST OF AREAS WAS BY NO MEANS COMPREHENSIVE, AND PRIMARILY WAS BASED ON CALCULATIONS AND

ESTIMATES RATHER THAN ON ACTUAL MONITORING DATA. NONETHELESS, IT SERVES AS AN INDICATOR OF SOME PLACES WHERE THERE MAY BE TOXICS PROBLEMS AFTER BAT, AND THE EXTENT OF THOSE PROBLEMS.

FOR INSTANCE, THE DELAWARE RIVER NEAR PHILADELPHIA, PENNSYLVANIA, MAY STILL HAVE HIGH LEVELS OF AT LEAST 15 HEAVY METALS AND ORGANIC CHEMICALS, INCLUDING CADMIUM, LEAD, AND CYANIDE EVEN AFTER BAT IS IN PLACE. IN MINNESOTA, MILLIONS OF POUNDS OF HEAVY METALS AND ORGANIC CHEMICALS ARE DISCHARGED EVERY YEAR INTO THE MISSISSIPPI RIVER NEAR MINNEAPOLIS-ST. PAUL. THIS INCLUDES AN ESTIMATED YEARLY DISCHARGE OF NEARLY ONE MILLION POUNDS OF DEHP (BIS(2-ETHYLHEXYL)PHTHALATE), WHICH CAN CAUSE CANCER OR BIRTH DEFECTS IN HUMANS. BAT CONTROLS ALONE MAY BE INADEQUATE TO REDUCE THE DISCHARGE OF THESE TOXICS TO A LEVEL SAFE FOR HUMANS AND AQUATIC LIFE. THE KANAWHA RIVER NEAR CHARLESTON, WEST VIRGINIA MAY STILL BE HEAVILY POLLUTED WITH NEARLY A DOZEN HEAVY METALS, INCLUDING MERCURY AND CHROMIUM, AFTER BAT CONTROLS ARE IN PLACE.

SO FAR, EPA HAS DONE LITTLE TO ADDRESS THIS PROBLEM. ALTHOUGH EPA ISSUED THE PRELIMINARY LIST OF HOT SPOTS, IT HAS NOT UNDERTAKEN MORE THOROUGH INVESTIGATION OR IDENTIFICATION EFFORTS. UNTIL A THOROUGH AND ACCURATE IDENTIFICATION IS COMPLETED, IT WILL BE IMPOSSIBLE TO DEVELOP ANY COMPREHENSIVE CONTROL STRATEGY TO ADEQUATELY ADDRESS THIS PROBLEM.

SECTION 7 OF HR 3282 WOULD ADDRESS THE PROBLEM OF TOXIC HOT SPOTS AND EPA'S FAILURE TO ACT IN A PRACTICAL AND COMPREHENSIVE

FASHION. HR 3282 WOULD REQUIRE EPA TO:

- IDENTIFY WATERS THAT WILL NOT MEET THEIR FISHABLE, SWIMMABLE WATER QUALITY STANDARDS BECAUSE OF HIGH VOLUMES OF INDUSTRIAL DISCHARGES;
- DETERMINE THE AMOUNT AND SOURCES OF THE PROBLEM TOXICS;
- DEVELOP AND ISSUE, ALONG WITH THE STATES, REGULATIONS THAT ESTABLISH INDIVIDUAL CONTROL STRATEGIES IN EACH OF THE HOT SPOTS; AND
- REQUIRE CONTROLS ON THE PROBLEM TOXICS BEYOND BAT BY THE INDUSTRIAL SOURCES THAT ARE SUFFICIENT TO ACHIEVE FISHABLE, SWIMMABLE WATERS NO LATER THAN THREE YEARS AFTER THE PROMULGATION OF THE STRATEGY.

THIS PROGRAM WOULD OCCUR OVER A PERIOD OF FIVE YEARS, AND IS ABSOLUTELY ESSENTIAL TO ACHIEVING CLEAN WATER IN THE 1980'S AND BEYOND.

SECTION 7 OF HR 3282 APPLIES TO WATERS THAT ARE CLASSIFIED FOR WATER QUALITY AS CLEAN ENOUGH FOR FISHING OR SWIMMING, BUT ARE NOT MEETING THEIR STANDARDS BECAUSE OF LARGE AMOUNTS OF INDUSTRIAL TOXICS. IN A FEW STATES THERE ARE WATERS THAT ARE NOT CLASSIFIED FISHABLE OR SWIMMABLE BUT ARE ALSO CONTAMINATED BY HIGH LEVELS OF TOXICS. FOR INSTANCE, THE GRAND CALUMET RIVER IN INDIANA IS ESSENTIALLY CLASSIFIED FOR INDUSTRIAL USE, BUT IT IS HIGHLY CONTAMINATED BY TOXICS, INCLUDING CYANIDE, LEAD, AND AT LEAST FIVE OTHER HEAVY METALS. THE BILL DOES NOT SPECIFY THAT THE HIGH LEVELS OF TOXICS IN WATERS LIKE THE GRAND CALUMET RIVER SHOULD ALSO BE REDUCED.

WE URGE THE SUBCOMMITTEE TO CLARIFY HR 3282 SO THAT RIVERS THAT ARE NOT CLASSIFIED FOR FISHABLE, SWIMMABLE WATERS BUT HAVE HIGH

LEVELS OF TOXICS ARE ALSO CONSIDERED TOXIC HOT SPOTS. THE INDUSTRIAL SOURCES CONTRIBUTING TO THESE WATERS SHOULD ALSO BE REQUIRED TO IMPLEMENT CONTROLS ON TOXICS BEYOND BAT NECESSARY TO ELIMINATE THESE HOT SPOTS.

ONE MECHANISM THAT COULD ACCOMPLISH THIS OBJECTIVE IS THE REQUIREMENT IN SECTION 7 THAT EPA "CONSIDER LISTING...ANY NAVIGABLE WATERS FOR WHICH ANY PERSON SUBMITS A PETITION TO THE ADMINISTRATOR FOR LISTING". THESE WATERS COULD ALSO BE ELIGIBLE FOR DESIGNATION AS TOXIC HOT SPOTS, SO EPA, WITH THE STATES, WOULD BE REQUIRED TO DEVELOP AND IMPLEMENT ADDITIONAL CONTROLS ON THE INDUSTRIAL SOURCES OF THESE TOXICS.

THE TOXIC HOT SPOTS CLEAN UP PROGRAM IN HR 3282 IS CRITICAL TO THE FUTURE HEALTH AND SAFETY OF OUR WATERS AND ENVIRONMENT. ONCE AGAIN, THE AMERICAN PEOPLE ARE COUNTING ON THIS COMMITTEE TO SOLVE A SERIOUS ENVIRONMENTAL POLLUTION PROBLEM.

* * * * * *

TIME AND TIME AGAIN, THE AMERICAN PEOPLE HAVE TURNED TO THIS COMMITTEE FOR LEADERSHIP IN COMBATTING WATER POLLUTION. THE PROGRESS IN RESTORING OUR NATION'S WATERS WHICH HAS BEEN MADE SINCE 1972 COULD NOT HAVE OCCURRED WITHOUT YOUR VISION AND YOUR EFFORTS. IN 1983, WE AGAIN LOOK TO THIS COMMITTEE TO PROTECT AND STRENGTHEN THE CLEAN WATER ACT'S PROTECTIONS FROM THE HARMS OF TOXIC WATER POLLUTION. HR 3282 INCORPORATES TOUGH WATER QUALITY

STANDARDS INTO THE ACT AND REQUIRES THE CLEAN UP OF TOXIC HOT SPOTS TO MAKE IT POSSIBLE THAT ONE DAY AMERICA'S RIVERS, LAKES, BAYS, AND ESTUARIES WILL BE SAFE FOR HUMAN AND AQUATIC LIFE. THE IZAAK WALTON LEAGUE OF AMERICA URGES THIS COMMITTEE TO ENACT THE WATER QUALITY RENEWAL ACT, HR 3282, TO FINISH THE JOB WE BEGAN ELEVEN YEARS AGO.

THANK YOU VERY MUCH FOR THE OPPORTUNITY TO TESTIFY TODAY. I WOULD BE HAPPY TO ANSWER ANY QUESTIONS.

Excerpts from:

A SURVEY OF AMERICAN ATTITUDES TOWARD WATER POLLUTION

Study No. 822033

Prepared for the Natural Resources Council of America - December 1982
Conducted by Louis Harris and Associates, Inc.

1. ATTITUDES TOWARD WATER POLLUTION

Pollution and the Quality of Life

Since 1976, the Harris firm has asked the American people how important a variety of factors are in improving the quality of life in the United States...Curbing water pollution has...always been rated "very important" by 70% or more of the public, and this year is no exception. Indeed, the 74% who now say that "curbing water pollution" is a very important quality of life issue is identical to the proportion who say that "keeping the economy growing" is very important...

Concern Over Specific Environmental Problems

The overall concerns people have about air and water pollution control finds specific application in a whole roster of specific worries:

-- By 95-4%, people feel that disposal of hazardous wastes is a serious problem in America.

-- By 93-6%, an almost identical majority feels that pollution of lakes and rivers by toxic substances from factories is a serious national problem.

-- By 88-10%, another sizable majority views pollution of lakes and rivers by sewage as a serious problem in this country.

-- By 84-14%, a big majority feel that contaminated drinking water is a serious national problem.

-- By 88-11%, a decisive majority believe that air pollution by industry generally is a serious problem in this country.

-- By 73-24%, a clear majority feel that water shortages are a serious problem in America.

-- By 80-18%, a substantial majority is convinced that air pollution by trucks and automobiles is a serious national problem.

-- By 70-25%, a majority feel that air pollution by coal-burning electric power plants is a serious problem in the nation.

-- By 61-28%, most Americans feel that damage to the landscape by coal strip mining constitutes a serious national problem.

2. THE CLEAN WATER ACT: AN OVERVIEW

Perception of Current Federal Water Pollution Standards

When asked to rate existing federal water pollution standards, 46% of the public say they are "not protective enough," 41% say they are "just about right," and only a small 6% rate them "overly protective."...A 60% majority...insisted that "Congress should make the Clean Water Act stricter than it is now." 34% feel Congress should keep the Act "about the same," and an almost nonexistent 3% want it made "less strict."

A Key Goal of the Clean Water Act

...Asked to consider "the high cost of cleaning up the nation's waters," an overwhelming 78% majority of the public nonetheless believes that "America's waters can really be made safe for fishing and swimming," while only 17% "don't really think that can be done."

3. THE BEST-AVAILABLE-TECHNOLOGY REQUIREMENT

Public Commitment to BAT

One of the 1977 amendments to the Clean Water Act specifies that factories must install the best available pollution control technology (BAT) by 1984....Fully 53% of those surveyed--a majority of the American people--feel so strongly about the need to control and prevent water pollution that they are willing to endure factories being shut down and people thrown out of work rather than allow factories waivers or variances from the BAT requirement. An additional 23% believe that only a factory which would otherwise have to close down should be granted a variance from BAT. Only 21% are willing to allow businesses to decide for themselves what pollution control systems they can afford....

The 1977 amendments to the Clean Water Act require all industries to be in compliance with BAT standards by 1984. However, to date the government has only issued a few of these industry standards, and virtually all experts agree that the deadline must be extended--to 1987 or 1988 at least--in order

continued...

to give the Environmental Protection Agency more time to research and set BAT standards, and in order to give industry time to comply with the new regulations. Nonetheless, the public opposes, by 57-37%, extending the deadline to 1987.

4. COST-BENEFIT ANALYSIS

Opposition to Requiring Cost-Benefit Analysis

The Clean Water Act...does permit the government to consider costs when setting water pollution standards for industries and municipalities. However, some industries have proposed that the Act be changed so as to require more strict cost-benefit analysis before the government issues standards. The public, by 74-23%, opposes such a change in the Clean Water Act....An overwhelming 89-6% of the public feels we need not sacrifice anti-pollution efforts to help the economy improve, up from a 64-22% margin who felt the same way in response to a similar question asked during the last major recession in 1975.

5. SAFE DRINKING WATER

Perceptions of the Safety of Drinking Water Supplies

The Safe Drinking Water Act, as the Clean Water act, is up for reauthorization in Congress this year. The Act requires that states meet national standards for drinking water purity...Legislation has been introduced in Congress to change this provision so that EPA may only regulate those contaminants that present "an unreasonable risk" to human health...A 2 to 1 majority (65-33%) want to keep the law in its present form, regardless of the cost of meeting the existing requirements.

6. THE COST OF CLEAN WATER

The Cost of the Clean Water Act

By 1987, the federal government estimates that the total cost of compliance with the current standards of the Clean Water Act will be $20.4 billion--which works out to somewhat less than $100 for every person in the country. Obviously individuals do not bear the full cost of water pollution clean-up efforts.... People were bluntly asked if they would be willing to pay $100 a year more in taxes and higher prices for clean and safe water.

By 70-26%, a large majority of the American people said they'd pay the extra $100....

Not surprisingly, people who go fishing, swimming, sailing, or hunting in or near lakes and rivers are even more willing to pay the cost of clean water than the rest of the public.

20-955 O—84——20

7. THE PUBLIC ASSESSES THE WETLANDS

When the 70 million acres of wetlands in the country were described to the public and the ecological balance role of wetlands were presented to the national cross-section, 83% nationwide said that it is "very important" to "keep the remaining wetlands free from further destruction."

A substantial 69% want federal standards for preserving wetlands made "more strict" and 22% want them kept as they are. Only 3% feel such standards should be made "less strict." Thus, by 91-3%, an overwhelming majority in general does not want any easing of standards for wetlands.

The New York Times

MONDAY, APRIL 18, 1983 A17

Keeping Water Clean

By Jack Lorenz and Daniel Weiss

ARLINGTON, Va. — William Ruckelshaus, President Reagan's choice to become the nation's No. 1 pollution fighter, will inherit an Environmental Protection Agency rocked by scandal and mismanagement. Mr. Ruckelshaus must soon confront policies proposed earlier by the Administration that would undermine America's pollution-control programs.

Perhaps the most far-reaching of these are the E.P.A.'s regulatory proposals that would allow states to weaken their efforts to clean up water pollution. If these proposals are adopted, they could halt the rejuvenation of our nation's waters that began during Mr. Ruckelshaus's previous tenure at the agency, under Richard M. Nixon. As the new administrator, he must take prompt action on these proposals, which Congress is scrutinizing.

Under the Clean Water Act, each state is required to set water-quality standards establishing pollution limits for specific bodies of water. In each case, the allowable pollution levels are based on the optimum use to which a lake, stream or river is put. For example, if a stream is designated for fishing, the water-quality standard would allow less pollution than in a stream to be used for industrial purposes. These state water-quality standards are a vital second line of defense in keeping water clean. They are used to require additional cleanup when Federal effluent limits for each of the major polluting industries are inadequate to achieve clean water.

However, the E.P.A.'s proposed changes would allow states to weaken their water-quality standards in a number of key ways. The states could more easily downgrade the designated uses for bodies of water. For instance, it would be easier to change a stream's designated use from swimming to navigation, thereby defining away pollution problems and allowing higher levels of polluted discharges into the waters.

Waters — including those in parks and wildlife refuges — that are already cleaner than required by existing water-quality standards could be allowed to become more polluted.

For the first time, states could trade clean water for economic growth and could grant exemptions from pollution-control requirements to industrial polluters that claim economic hardship.

The E.P.A. cites the Administration's arguments for regulatory reform to justify its proposals, claiming that the changes will allow states more leeway in carrying out pollution-control strategies. But this additional flexibility could have disastrous environmental consequences, and a number of states — among them New Jersey, California and Minnesota — have gone on record opposing the changes. If states can loosen their cleanup standards, industrial polluters will have an incentive to go "pollution shopping" — closing plants in states with tough standards or locating them in states with weak ones. This could pose an especially difficult dilemma for economically hard-pressed states that may be faced with the choice of weakening pollution controls or losing jobs.

The public rejects the notion underlying the Administration's proposals that a healthy economy and a safe environment are mutually exclusive. In a poll of public attitudes toward water pollution released in December, Louis Harris found that fully 89 percent of those surveyed felt that clean-water initiatives need not be sacrificed to get the economy moving. Public support for clean water is so strong that a sizeable majority of respondents said they want existing tough clean-water programs maintained — even if they result in fewer jobs or higher costs.

The last Congress refused to pass legislation that would scale back water-pollution controls. Congressional leaders have urged the E.P.A. not to approve the proposed regulations, realizing that if they are adopted, more than a decade of progress toward attaining cleaner water could go down the drain.

The Clean Water Act and regulations now in force are working. For example, you can now fish and swim in much of New York State's Mohawk River — little more than an open sewer only two decades ago — and crabs, shad and bluefish are returning to the Hudson River. While all bodies of water have not shown such dramatic improvements, most, at least, have not gotten dirtier, despite population and industrial growth.

The American people recognize that clean water is critical to a sound environment, a strong economy and to health, and they continue to support tough antipollution measures. Mr. Ruckelshaus can respond to this overwhelming mandate by jettisoning the proposed regulations and steering the clean-water program back on course. If, however, he proceeds with the proposals, business as usual will continue at the Reagan E.P.A.

Jack Lorenz is executive director and Daniel Weiss is a conservation associate of the Izaak Walton League of America, which is concerned with conservation of natural resources.

The Promise of Clean Water

The Clean Water Act now being reauthorized by Congress has been a mixed success. It has enabled fish to return to the Hudson, but the fish are too contaminated to eat. It has kept the nation's lakes and rivers from getting any filthier, despite substantial growth in industrial activity, but water quality has not greatly improved in the last seven years.

In revising the act this week, the Senate needs to remember the original goal: attaining clean water by 1985.

The insufficient progress is due to the long delay in implementing the law. Polluters who discharge into municipal sewer systems and those who dump directly into waterways have had a holiday from the law's full force. Only now is the Environmental Protection Agency issuing the final treatment standards with which each group must comply.

Under its new administrator, William Ruckelshaus, the agency has backed off considerably from a plan to let the states wield authority over the pretreatment of wastes dumped into sewage systems. Untreated, such wastes can damage sewage plants and render municipal sludge useless as fertilizer or landfill.

Mr. Ruckelshaus is also asking for broader enforcement powers against polluters. With these changes, revision of the law has drawn far less heat than it did last year, when Congress failed to act. But the law still has big gaps.

•

The present statute is directed only against specific sources of pollution, like industrial and sewage plants. But half of all conventional pollution comes from more diffuse sources, like storm water drainage from city streets, dirt from construction sites and agricultural runoff.

Effective remedies are at hand. Measures to reduce soil erosion, which in itself constitutes a highly desirable goal, would reduce the burden of soil, pesticides and fertilizer that farmers impose on the waterways of the nation. Placing bales of hay around construction sites would trap debris that now fouls nearby streams.

Another gap in the law lets through excessive amounts of chemical pollutants. Some 400 million pounds of toxic chemicals and heavy metals are dumped into the waterways each year. When the Environmental Protection Agency issues its long-delayed guidelines specifying the best available technology for removing these pollutants, discharges can be cut to 100 million pounds.

Even this reduction will leave some waterways too polluted for fishing or swimming. A bill proposed by Representative Howard of New Jersey would have the E.P.A. identify these toxic "hot spots" and require further cleanup.

•

An issue of concern to New York is the city's hope for waivers that would allow it to give only partial treatment to sewage dumped into the Hudson and East Rivers. The city believes that its new sewage treatment plants will let it meet water quality standards with room to spare for some relaxation of treatment. Granting all its waivers would save some $300 million in construction costs. The Senate's present bill is too harsh in forbidding consideration of any of them.

The Administration has now thought better of its ill-considered design to weaken the water law. Congress should seek to hasten the day when fishing licenses no longer need to warn against eating too much of a day's catch.

BAILEY GUARD STAFF DIRECTOR
JOHN W. YAGO, JR. MINORITY STAFF DIRECTOR

United States Senate
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
WASHINGTON, D.C. 20510

March 14, 1983

Dr. John W. Hernandez, Jr.
Acting Administrator
Environmental Protection Agency
401 M Street, SW
Washington, DC 20460

Dear Dr. Hernandez:

We are concerned about recent Environmental Protection Agency proposals to revise regulations governing establishment and revision of water quality standards under the Clean Water Act. The proposed revisions were published October 29, 1982, at 47 Fed. Reg. 49234.

The proposed regulatory changes go to the heart of the clean water program — our national commitment to the restoration and maintenance of the chemical, physical and biological integrity of the Nation's waters and to the goal that "wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983."

The "fishable/swimmable" goal, as it is usually called, was not intended to be a hollow promise when it was established in 1972. It is a goal that we take seriously. It must be achieved through the mechanism of water quality standards adopted by the States. Therefore, except where the "fishable/swimmable" goal is unattainable, water quality standards should be established to reflect that goal and the basic objective of the Act. This intent is carried out in sections 302, 303, and 316.

The proposed new regulations appear to substitute for the baseline water quality goal enacted by Congress a broad benefit/cost comparison test that easily could lead to downgrading of existing water quality standards. The water quality regulations revisions give States less Federal direction than the Clean Water Act requires for determining the use of a particular body of water. Under the new regulations, streams previously categorized by a State for fish and wildlife or other high quality use could be downgraded on the basis of a comparison of values which are exceedingly difficult to calculate.

Even though the new regulations, on their face, would not require any State to use the benefit/cost comparison test, there is a very real danger that if States are permitted to downgrade their waters, industry will be able to "shop around" for areas in which water quality standards would be lower. In addition, this analytical exercise would command personnel and financial resources that already are stretched too thin in many States.

We also are concerned that the new regulations would shift the emphasis from desired water quality to current water uses. In fact, in hearings before the Subcommittee on Environmental Pollution last July, EPA referred to "the Administration's view that pollution control requirements should be directly linked to the protection of the actual uses of the receiving water." Thus, existing "fishable/swimmable" standards for a particular segment could be downgraded on the basis, for example, that dangerous currents or barge traffic preclude swimming.

Also, the proposed regulations drop existing requirements that current water quality levels not be degraded and that States upgrade water quality standards where actual uses exceed those designated in the standards. These revisions are diametrically opposed to the objective and goal of the Act.

The proposed regulations have generated substantial controversy because, whatever EPA's intent, they give the appearance of retreating from our commitment to the central objective and statutory water quality goal of the Clean Water Act.

We urge you to withdraw the proposed regulations. Withdrawal of the proposal for further study would be a clear signal that the Agency is committed to fulfilling its Congressional mandates and to the goals of the Clean Water Act. This might also avoid the need for the Committee to consider corrective legislation with regard to the proposed water quality standards regulations.

We wish you well in your management of the Agency, and hope you will give serious attention to this urgent suggestion.

Sincerely,

Jennings Randolph

Mr. ROE. Please proceed.

TESTIMONY OF BEN DYSART, PRESIDENT, NATIONAL WILDLIFE FEDERATION, ACCOMPANIED BY SHARON NEWSOME, LEGISLATIVE REPRESENTATIVE, DR. PAUL RINGOLD, DIRECTOR, OCEAN DISCHARGE PROJECT, DR. ALLEN WENTZ, DIRECTOR, FISH AND WILDLIFE PROJECT; JOHN McCOMB, DIRECTOR, WASHINGTON OFFICE, SIERRA CLUB; AND DANIEL WEISS, CONSERVATION ASSOCIATE, IZAAK WALTON LEAGUE

Dr. DYSART. Thank you, Mr. Chairman, members of the subcommittee.

For the record, my name is Ben Dysart. I am president and chairman of the board of the National Wildlife Federation and appear today in that capacity.

I would like to thank the subcommittee for inviting the Federation to testify today in support of H.R. 3282 introduced by Chairman Howard. I am accompanied today by Sharon Newsome, Federation's Legislative Representative, Dr. Paul Ringold, Director of our Ocean Discharge Project and Dr. Allen Wentz, Director of our Fish and Wildlife program.

Mr. Chairman, you have our full statement which has been submitted for the record, and with your permission and I would like to provide some summary comments.

Mr. ROE. Without objection, so ordered.

Dr. DYSART. Thank you. We believe this is an excellent bill which will close some glaring gaps in the existing Clean Water Act.

We certainly commend Chairman Howard for his leadership and the other gentlemen for their cosponsorship. The federation is the world's largest nonprofit conservation organization devoted to wise use and conservation of our Nation's resources.

I speak today on behalf of our more than 4 million members and supporters and also our 51 affiliated State and territorial organizations.

Mr. Chairman, I am very familiar with the environmental protection and water quality areas as I hold degrees in civil, sanitary and water resource engineering from Vanderbilt and Georgia Tech and for the last 15 years taught environmental engineering at Clemson University at the graduate level. I am past president of the Association of Environmental Engineering Professors. I have conducted a good bit of research germane to the topic of this legislation sponsored by major Federal agencies, as well as the private sector.

Several years ago I had the opportunity to serve full time as the science adviser to the first Assistant Secretary of the Army for Civil Works. When Congress authorized the act in 1972, it affirmed the Nation's commitment to fishable and swimmable waters. Though it is clear to all of us that the goals of this legislation will not be met on time, we believe substantial progress has been made. We believe the Nation and people are a lot better off because of this progress. We support H.R. 3282 because it addresses continuing water pollution problems. Five of these are of particular interest to the federation.

First is the importance of section 404 in protecting our wetlands and water quality.

Second, the more than 200 applications for discharging sewage into estuaries and the ocean.

Third, the need for special recognition and management of bays and estuaries.

Fourth, the continuing impact of dams on water quality and last, the largely unabated problem of nonpoint pollution.

First, let me comment on section 404. We are very happy to be here before this subcommittee to offer some brief comments. We hope to have the opportunity in the future to provide additional comments and testimony.

The protection of our Nation's rapidly vanishing wetlands through a strong regulatory program under section 404 will continue to be one of the Wildlife Federation's highest priorities.

You certainly do not have to be an engineer or scientist to understand and appreciate that the Nation's waters are ecologically and hydrologically interrelated.

Consequently, the destruction or degradation of our wetlands adversely affects the physical, chemical and biological integrity of all our waters.

Section 404 is widely credited with reducing wetlands loss due to disposal of dredged or fill material by about one-half as compared to what would have occurred had there been no section 404.

Therefore, we believe this provision plays an absolutely essential role in continuing to move toward meeting the goals of the Clean Water Act; that is, restoration and maintenance of the Nation's waters. It is also very important because wetlands are critical habitat for commercial and sports fisheries and wildlife, game as well as nongame species.

I can assure you that our organization and our membership and our leadership are very sensitive to the problems of commercial fisheries, the Chesapeake Bay and other areas. I and many of our leaders occasionally have the opportunity to come looking for geese on the Eastern Shore. So we certainly appreciate the resources that are being discussed here.

Over the past year and a half, the army has substantially revised the section 404 program and further changes have been proposed recently.

A number of these rescissions and proposed revisions concern us a great deal because we believe that they seriously weaken the ability of section 404 to protect the Nation's water and especially the wetlands.

We support the amendments to 404 included in H.R. 3282. The amendment to 404(b) affirms the fundamental standards for protection of the aquatic environment currently contained in EPA's guidelines. This is the presumption against disposing of fill material in wetlands and requiring a search for practical alternatives.

We believe this amendment is critically important because of the repeated and continuing attempts by the Department of the Army to weaken the substantive standards of 404(q) guidelines. The amendment to this section seeks to make interagency review of permits once again a meaningful and equitable process.

The amendment provides the Federal resource agencies with sufficient time to evaluate controversial permits and removes the authority for the Assistant Secretary of Army for Civil Works to veto permit referral requests by those agencies.

Finally, under 404 we would encourage this subcommittee to include an amendment to section 505 to allow citizens to bring lawsuits against the Secretary of the Army for failing to carry out his section 404 duties.

Section 505 already allows such action against the EPA administrator for 402 permits. Frankly, we see no reason to treat section 404 any differently.

On the matter of ocean discharge waivers, for some time the federation has been concerned about the more than 200 pending applications for ocean discharge waivers.

Our concerns have grown since we have analyzed the individual waiver applications. In 1977, Congresss added section 301(h) to the Clean Water Act. This controversial provision established a means by which publicly owned treatment works discharging through outfalls into oceans or certain estuarine areas could obtain waivers from secondary treatment on a case-by-case basis if approved by EPA after approval by the State. Before obtaining a waiver, the municipality would have to demonstrate that the modification would not impair the integrity of the receiving waters.

The provision was the act's first major departure from a strict technology-based approach to the control of water pollution. Since its adoption, 209 coastal cities and communities have applied for waivers. Many are large industrialized cities including Boston, Philadelphia, Los Angeles, and Miami. In some cases, applicants are proposing to discharge sewage that is almost completely untreated into ocean waters and estuaries.

L.A. County's historic discharges led to what EPA characterized as, "massive changes in structure, function, abundance, and diversity of inshore plants and animals." Recent improvements in the discharges are, according to EPA, apparently insufficient to allow for complete recovery of the kelp beds." We support the proposal to eliminate waivers in estuaries because of the great potential for harm to these sensitive areas. I am sure you and all the members of the subcommittee have heard the statement that 80 percent or so of our commercial and recreational fisheries catch and a large portion of our population lives very close to estuaries.

Fish, wildlife and people make estuaries our most intensively utilized areas. Another example is New York harbor. Fourteen outfalls waiver applications from New York and New Jersey are concentrated in the Hudson River, New York harbor area. Eleven of the applications have concentrations of suspended solids and BOD that stay in the discharge area and disperse slowly.

Seven of the applicants have toxics in amounts that exceed allowable concentrations in the EPA marine water quality criteria. All of these would be discharged in waters that do not support a balanced indigenous population of shellfish and wildlife and fish or do not meet water quality standards for at least a portion of the year. Taken together these applications would permit the release of about a billion and a half gallons per day of sewage that has less

than secondary treatment. This also contains a good bit of toxic material.

Puget Sound, San Francisco Bay also have large numbers of applications in for waivers. The other provisions of H.R. 3282 which would require a minimum of primary treatment and control of toxics for the remaining true ocean discharge waivers are essential if the marine environment is to be adequately protected from adverse impacts. For those municipalities which do receive a waiver we also suggest additional monitoring requirements to try to insure that there are no major long term adverse impacts.

Next, very brief comments on protection of bays and estuaries. We support not only elimination of sewage treatment waivers but also the special recognition and provision for management conferences called for in H.R. 3282. In many cases the watershed goes beyond political boundaries and requires for its protection economic and multijurisdictional resources far beyond the capabilities of individual States.

H.R. 3282 provides matching grants for States and watersheds so they can come together to develop meaningful plans for controlling both point source and nonpoint sources affecting the bay.

Next the matter of water quality and dams. As most people realize the federation has been concerned about the impact of dam discharges for some time. Those discharges from existing dams as well as dams under construction such as the Richard B. Russell Dam on the Savannah River near my home in South Carolina.

Dams can adversely affect downstream as well as in reservoir water quality and aquatic habitat in a variety of ways. This tends to be much more of a problem in certain parts of the country than in others. In addition downstream communities have to pay more to achieve higher levels of waste treatment because of the low dissolved oxygen in discharges from such upstream dams.

Large dams can cause major water quality problems due to many changes that occur. Not all dams, however, can be considered problems. These problems tend to develop principally behind high dams and large reservoirs. This is particularly a problem in the South and Southeast.

Chairman Howard's bill would require that EPA, in cooperation with other interested Federal agencies and States, study and monitor the effects of dams on our Nation's waters and to have EPA present a study, results of the study and recommendations to Congress in 1985. Whether it is for public water supply or sport fishing the public has a substantial stake in reservoir water quality.

We believe the public should have the opportunity to have input to this study, also, in addition to that of EPA and the State agencies. We applaud this effort by Mr. Howard and it is certainly a good step toward control of pollution caused by dams.

Our final comments, Mr. Chairman, relate to nonpoint sources. In 1977, the General Accounting Office estimated that over half the pollution entering the Nation's waterways was from nonpoint sources, and the most important of nonpoint sources were agricultural activities, urban storm water runoff, silviculture, and poorly designed and managed septic systems.

Unfortunately the nonpoint source situation has not improved much in the interim. Since 1974, nearly half a million dollars has

been spent on studies, plans, and demonstration projects. The failure in not reducing nonpoint source related pollution has not been in the plans and projects but rather our failure to implement what we have learned.

The tangible costs to society of letting nonpoint pollution continue unchecked is very high. The Nation is losing productivity and nutrients from its land. We are smothering fish habitat and wetlands. We are contaminating fish and shellfish, and we are spending over $300 million a year dredging out the resulting silt from our reservoirs, lakes and harbors. The list could go on.

I might also add that the intangible or less tangible but nevertheless very real cost to the public are also substantial. We would urge the subcommittee to adopt a nonpoint pollution program. The program should target those waterways where nonpoint runoff is a major source of pollution. It should be mandatory on the States to identify or to develop and actively promote the use of appropriate and effective best management practices, or BMP's, for those individual sources that are producing the pollution.

Based on my own experience, Mr. Chairman, both from research and from a considerable amount of applied real world experience, I know that there are BMP's available which if properly selected, designed, constructed, operated, and maintained, individually and in systems, can effectively reduce the export of soil, nutrients, herbicides, oxygen demanding materials, heavy metals and other toxics offsite and into our surface waters.

This can be done at a cost which is not prohibitive if there is a genuine commitment to cope with this serious and longstanding water quality problem and to move on in a substantial way to protecting our Nation's streams. The water quality oriented committees of the Congress, the Environmental Protection Agency and the State agencies with water quality responsibilities have to insist that water quality be the real focus and that the right BMP's be specified, put in place and operated properly. I think my own environmental engineering profession has to recognize the problem and utilize the latest in proven cost effective design procedures for nonpoint pollution. I think you and the Congress and the American taxpayers should certainly expect the same level of performance, effectiveness and reliability for nonpoint control facilities as we all expect and know we can depend on from my environmental engineering colleagues in dealing with industrial and municipal wastewaters that arrive in pipes into modern and well-operated waste treatment plants.

I am confident this can be done. A date should be set by which all sources would be required to implement suitable practices and systems of practices.

In addition, we believe that Federal agencies should make their assistance programs consistent with the States' programs so that a Federal agency is not encouraging a practice which a State is trying to discourage.

Finally, EPA should have the authority to step in and develop a program if the States do not act. I believe, and the National Wildlife Federation believes, Mr. Chairman, that this subcommittee can make the most meaningful improvement in the Clean Water Act for this reauthorization period by adopting a mandatory control

program for those limited areas and sources which contribute to nonpoint pollution.

Mr. Chairman, we appreciate the opportunity to testify before your subcommittee this morning. We would be pleased to address any questions you might have, sir.

Thank you.

Mr. ROE. Want to thank you Dr. Dysart.

Now, we have Mr. McComb, who is director of the Sierra Club.

Mr. MCCOMB. Thank you, Mr. Chairman, members of the subcommittee. I am John McComb, director of the Sierra Club's Washington office.

Control of water pollution is a top priority to the American people, as well as to members of the Sierra Club. In December 1982, Louis Harris and Associates conducted a nationwide survey of American attitudes toward water pollution for the Natural Resources Council of America. Here are a few highlights from that survey. The Harris poll asked people how important a variety of factors are in improving the quality of life in the United States. Curbing water pollution was rated "very important" by 74 percent, identical to the rating for "keeping the economy growing."

Concern about toxic wastes is even greater. An overwhelming 95 percent of Americans feel that disposal of hazardous wastes is a serious problem in America. Ninety-three percent feel that pollution of lakes and rivers by toxic substances from factories is a serious national problem. That broad concern is reflected in our internal priority setting process where members have chosen clean water and toxic legislation to be among their highest priorities for the 98th Congress.

We support Chairman Howard's H.R. 3282 because it embodies a clear commitment to maintain and improve the quality of America's waters.

According to EPA estimates, nearly 300 million excess pounds of toxic pollutants will be unnecessarily discharged into America's waterways and sewer systems each year that pretreatment and BAT controls are delayed. These are chemicals that cause cancer, birth defects, and have other adverse effects on human health and aquatic life.

In order to help this committee help frame the major issues with which you will have to deal, I would like to briefly discuss two specific issues in the remainder of my testimony. These two areas are pretreatment of industrial wastewater and best available technology commonly known as BAT.

In 1977, Congress wisely enacted a national program requiring pretreatment of industrial wastes to remove toxics before they enter municipal sewage treatment plants. As this program is beginning to take effect, it is coming under attack from some industries that want to avoid the costs of pretreatment and from some municipal sewerage agencies that do not want to meet Federal pretreatment requirements.

There have been suggestions for weakening the program by allowing municipalities to use their own pretreatment programs instead of the Federal one. Any new program to exempt municipalities or industries would delay for years the implementation of pollution controls. Planning a new program and tailoring it to each

local community would severely strain the resources of the Environmental Protection Agency, which are sorely needed elsewhere. In addition, it is more fair for industries to pay to clean up their wastes.

The final result of pretreatment waivers would probably be a higher level of toxic pollution, because only municipalities with weaker pretreatment programs would be motivated to apply for waivers. In the best of cases—where the sewage treatment plant is successfully removing the toxics from the water—there is still the problem of contaminated sludge. A small quantity of concentrated toxic wastes removed from the industrial effluent at the plantsite can sometimes be recycled, and in other cases it can be much more efficiently destroyed or disposed of than vast quantities of municipal sludge that contain lower concentrations of toxic wastes.

We are pleased that H.R. 3282 would not weaken the existing national pretreatment program.

The best available technology economically achievable or BAT guidelines are designed to reduce industrial toxic pollution discharged directly into rivers and other waterways. The Clean Water Act requires industries to comply with BAT by July 1, 1984. However, EPA has been slow to formulate the BAT standards and is not expected to finish issuing them until that date. Industries will then need some time to comply with the guidelines. No one disputes the need to extend BAT deadlines; the question is the length of the extension.

Every year of delay in the implementation of BAT will result in about 100 million pounds of excess toxic wastes being discharged into the Nation's waters. Deciding the length of the delay of deadlines therefore has a significant impact on the environment and public health. The EPA is issuing BAT regulations according to a phased schedule from the date regulations are issued.

The Sierra Club supports H.R. 3282, which allows industry 3 years to comply with BAT from the date the regulations are issued. Representatives from EPA and several industries have testified that 3 years allow sufficient time for compliance. We would oppose extensions beyond 3 years.

The Sierra Club strongly opposes exemptions or variances from BAT requirements. Congress rejected the idea of variances in 1977, and they are no more justified in 1983. Chemical industry representatives have argued that they should not be required to implement BAT when water quality standards are being met. This argument is not credible because, at present, the water quality standards of most States do not even have criteria for many frequently found toxic pollutants.

Particularly in the area of toxic pollutants, we should err on the side of caution. A program of BAT variances would inevitably increase hazards to public health.

I will conclude by reiterating the Sierra Club's support for H.R. 3282. We believe it provides a sound basis for renewal of the Clean Water Act. We and other representatives of the environmental community will be prepared to provide more detailed testimony and information at the additional hearings on this subject planned by this committee.

That concludes my testimony. Thank you.

Mr. ROE. I want to thank you, Mr. McComb.

We have now our next witness on the panel, Daniel Weiss, who is representing the Izaak Walton League.

Mr. Weiss.

Mr. WEISS. Mr. Chairman and members of the subcommittee, my name is Daniel Weiss, and I am a conservation associate specializing in water issues with the Izaak Walton League of America. It is a pleasure to appear before you briefly this morning to comment on the Clean Water Act, a law that is vital to our Nation's efforts to clean up our rivers, lakes, bays, and estuaries.

I would like to submit a longer statement for the record, and affiliate myself with the remarks of my colleagues.

Two issues face Congress with regard to the Clean Water Act. One issue is the Reagan administration's proposals to weaken the Federal regulations governing State water quality standards.

Second, we must solve a new problem, toxic hotspots. Members of the House Public Works Committee have been instrumental in raising critical concerns about both of these issues. Chairman Roe has repeatedly voiced his concern that the proposed water quality standards would undermine strong State clean water programs and inhibit the achievement of the goals of the act.

And H.R. 3282, introduced by Chairman Howard and sponsored by other members of the committee, would solve both of these problems by incorporating the key principles of the existing water quality regulations into the act, and by requiring EPA to identify and clean up toxic hotspots.

On October 29, 1982, the EPA proposed changes in the water quality regulations that would halt and perhaps reverse 10 years of progress in restoring and protecting our waters. These proposals also threaten future efforts to control deadly toxic discharges.

The Izaak Walton League opposes the EPA's proposals to alter the existing regulations because they would eliminate mandatory State review of all water quality standards; allow States to downgrade or weaken water quality standards more easily; limit the antidegradation policy to the protection of existing uses only; allow variances, or exemptions, for heavily polluting plants from needed pollution controls; and reduce opportunities for public participation in State clean water programs.

Together these proposals signal a major retreat from meeting the goals of the Clean Water Act. EPA's proposed regulations would make it much easier for States to permanently downgrade standards and allow more pollution if abnormally low stream flows during a dry spell cause temporary reductions in fish populations; a stream designated for swimming is too shallow to actually swim in; or the benefits of meeting a standard do not bear a reasonable relationship to the costs. Rather than going to the trouble of requiring the clean up fouled streams, States could instead easily downgrade standards, thereby defining away pollution problems.

EPA claims that these changes are needed because some States adopted water quality standards that were unreasonably strict and costly, and wants to allow States to weaken these standards to allow more pollution in the waters. EPA has yet to demonstrate actual instances where the existing regulations have been inflexible and have prevented a State from downgrading a standard that

could not be met. In fact, under the existing regulations, Minnesota has recently downgraded 208 stream segments, covering approximately 800 miles, because the State believed that they could never become fishable or swimmable. If EPA permits this amount of downgrading of standards now, we can expect much more downgrading under these proposals. This would reward States and industries that have done a poor job of cleaning their waters. EPA's downgrading proposal makes achieving the fishable, swimmable goal of the act more difficult.

Significantly, EPA would also eliminate the requirement that States must upgrade, or strengthen, water quality standards if a stream is meeting a higher use than the standard requires. For instance, Minnesota is evaluating whether to upgrade the water quality standard of the once-poisoned St. Louis river. Eliminating the mandatory upgrading provision could put an end to this effort to insure that current improvements in water quality become permanent.

EPA's proposals would curtail protections for high quality waters—including national parks and wildlife refuges—that are cleaner than the strictest water quality standards requires. These waters could be polluted so long as the existing uses were still met. This change in antidegradation rules would encourage States to strive for only the minimum level of pollution cleanup needed to meet water quality standards.

Taken together, EPA's proposals would fundamentally weaken State water quality programs. Recalcitrant industrial polluters would have incentives to go pollution shopping—closing plants in States with tough standards or locating them in States with weak ones. The philosophy underlying EPA's proposals is that water pollution control efforts should only strive to meet water uses and not achieve water quality. This would significantly lower the sites of the Nation's clean water program. If that happened, the Clean Water Act might be more aptly called the Clean Enough Water Act.

New Jersey along with California, Minnesota, and over a dozen other States has found fault with EPA's proposals even though they are the supposed beneficiaries of the changes.

For instance, New Jersey determined that EPA's proposals would introduce uncertainties that would slow and perhaps halt much of our pollution control efforts. Nationwide, the Louis Harris survey found that 70 percent of the people polled would pay $100 more a year in taxes and prices to clean up water pollution. The people in this country are willing to pay for clean water; it is up to the Congress to make sure that the EPA responds to this mandate by retaining tough water quality regulations. There is a summary of the Harris poll attached to my statement.

H.R. 3282 retains strong water quality standards. The existing regulations have proven strict enough to maintain strong State water quality standards, while remaining flexible enough to allow necessary adjustments in standards. H.R. 3282 would incorporate the key principles of the existing regulations in the act, ensuring that this delicate—yet critical—balance is maintained.

Additionally, H.R. 3282 would require States to adopt numerical water quality criteria for toxics. This is consistent with and critical

to achieving the goals of the act. Currently, only about half the States have any numerical standards for toxics in their standards--and they usually cover only a handful of heavy metals. These standards rarely consider the chronic efects of these toxics or their exposure to humans through the food chain.

For example, fewer than 25 States have numerical standards for mercury and only nine of these have standards stringent enough to protect human health, based on the EPA "White Book" criteria. Many of the standards for other toxics are also considerably less stringent than EPA's national criteria for those substances. William Ruckelshaus has hinted that EPA may propose final water quality regulations that do not include some of the more unworkable, costly, and environmentally destructive changes proposed by the administration last fall. However, we strongly urge the committee and the Congress to stand firm in its resolve to determine the national policy for clean water as proposed in H.R. 3282. This is a national policy that should be established by Congress, and not by unelected bureaucrats at EPA or OMB. Incorporating key principles of the existing regulations into the act guarantees that EPA will faithfully abide by and implement the policies established by Congress in operating the water quality standards program.

Second, even if Administrator Ruckelshaus proposes fairly sound water quality regulations, there is no guarantee that he will be able to get final approval for such regulations from OMB, or that they will remain in place after he is no longer EPA Administrator. We strongly urge the subcommittee to enact section 6 because it will force EPA to get on with the job of cleaning up our Nation's waters.

The second key problem is toxic hotspots—the unsolved threat. Toxic hotspots are a pollution problem currently unaddressed by the Clean Water Act. In some areas around the country BAT pollution control requirements alone will be inadequate to achieve fishable, swimmable waters. These waters will still be heavily polluted with toxics even after BAT requirements are met because of the large number of industrial facilities that will be discharging into them. These areas are called toxic hotspots.

In 1981, EPA released a list of 34 urban, inland areas that might have high levels of toxics in their nearby waters even after BAT is in place. For instance, the Delaware River near Philadephia, Pa., may still have high levels of at least 15 heavy metals and organic chemicals, including cadmium, lead, and cyanide even after BAT is in place.

So far, EPA has done little to address this problem. Section 7 of H.R. 3282 would address the problem of toxic hotspots and EPA's failure to act in a practical and comprehensive fashion. H.R. 3282 would require EPA to identify toxic hotspots; determine the amount and sources of the problem toxics; develop and issue, along with the States, regulations that establish individual control strategies in each of the hotspots; and require controls on the problem toxics beyond BAT by the industrial sources that are sufficient to achieve fishable, swimmable waters no later than 3 years after the promulgation of the strategy.

This program is absolutely essential to achieving clean water. Time and time again, the American people have turned to this

committee for leadership in combating water pollution. The progress in restoring our Nation's waters which has been made since 1972 could not have occurred without your vision and your efforts. In 1983, we again look to this committee to protect and strengthen the Clean Water Act's protections from the harms of toxic water pollution. H.R. 3282 incorporates tough water quality standards into the act and requires the cleanup of toxic hotspots to make it possible that one day America's rivers, lakes, bays, and estuaries will be safe for human and aquatic life. The Izaak Walton League of America urges this committee to enact the Water Quality Renewal Act, H.R. 3282, to finish the job we began together 11 years ago.

Mr. ROE. Thank you very much for the opportunity to testify today. I would be happy to answer any questions.

Thank you very much, Mr. Weiss.

Ms. Newsome, do you have anything to add?

Ms. NEWSOME. No.

Mr. ROE. Thank you.

Well, we want to thank the distinguished witnesses for a good beginning and good comprehensive overview of where we have been and where we should be directing our attention.

Are there any members who have any questions they want to ask the panel at this point? Mr. Moody?

Mr. MOODY. I would like to ask both the Sierra Club and the Izaak Walton representative a basic question. It used to be we talked about the tradeoff between jobs and environment. I was one in the State legislature of Wisconsin who worked very strongly for the environment.

Now we talk about cost of Government versus environmental cleanup. We are not talking about trivial sums of money, but many billions of dollars.

How do you in a general sense weigh the costs? There are some pollutions which are so expensive to clean up and would require more of our society's resources than economically feasible.

How do you strike a balance? This is a generic question and takes us far afield from the bill, but your testimony goes far afield from the bill, if I may say so.

Mr. WEISS. Well, the existing act already requires the best available technology economically achievable for the control of toxics.

So the concept of cost is already built into the process in which you develop the controls. As BAT guidelines have been issued, a number of treatment requirements have been ultimately rejected by EPA because the Reagan EPA believed that they were not economically achievable.

So that the concept of cost is already built into the act. Now, when it comes to controlling pollution and toxic hotspots, what we are talking about there are areas that even after the economically achievable controls are in place, there will still be dangerously high levels of toxic pollutants, including such substances as lead, cadmium, mercury, PCB's, and cyanide.

What will be needed there is for EPA to require control strategies for these particular problem toxics for the particular dischargers. So some of these dischargers may have to go beyond BAT.

20-955 O—84——21

What we are expecting to happen is that these dischargers would have to perhaps implement some of the controls that were initially rejected as not being economically achievable industrywide, whether or not they are economically achievable for that particular facility.

To sum up, we believe that the Clean Water Act already addresses that problem to a great extent because the controls have to be economically achievable.

Mr. MOODY. To follow up the question, do you think the current EPA administration has interpreted that economic component correctly, or do I sense from your testimony you think they have been too generous?

Mr. WEISS. In some cases, of the 12 best available technology guidelines that have come out under this administration, fully half of them require little or no additional cleanup beyond what is happening now.

In some of those cases, EPA may have erred too much on the side of weighing the costs when setting the guidelines.

Mr. MOODY. Mr. McComb?

Mr. MCCOMB. I would agree a good deal of what Dan Weiss has said. Certainly the committee is properly going to have to weigh those costs and tradeoffs. I am very cognizant of them.

At some point it isn't worth it. I think we have learned there is a great willingness on the part of the American public to pay significant costs in order to have clean water.

There is one other factor I think is important to keep in mind. There are often some localized impacts which are adverse to a particular municipality or particular industry, but there are often offsets to those in other areas where there are clear benefits to the economy.

We listened to Representative Dyson this morning talking about the economy of the Chesapeake Bay. I think we need to find some way of dealing with what benefits some area may hurt some others at the same time.

Mr. MOODY. Another closely related issue is that of a uniform standard versus a standard on the body of water receiving the discharge. Coupled with that is the question of whether or not you measure the toxicity of the outflow itself, or its impact into the total body.

For example, a given discharge into Lake Michigan may be more serious than it would be for a smaller lake. I mean the size, the way a body of water may scour itself, yet a uniform standard might not take that into account.

Could you comment on that?

Mr. WEISS. Yes. What we found before 1972 is that case-by-case pollution controls simply did not work. We didn't have the body of scientific knowledge to determine effects of toxics.

Case-by-case controls were expensive to develop. They were easy to circumvent in the courts. They had the effect of pitting one State against another in terms of a State having to choose between tough standards or attracting industry.

That is why some system of developing uniform controls was needed. The controls in the act now are not based on the effects of toxics on water bodies. Rather, they are based on the ability of pol-

lution control technologies for each particular industry to remove pollutants.

What the act calls for is ultimately the best available technology economically achievable within an industry to have a level equivalent to that.

This is where the hotspots program comes in. First all dischargers are meeting a minimum floor of removal, so a steel plant in Wisconsin has to meet the same removal levels that a steel plant in Texas has to. Then, if places where you are still not able to achieve water quality is considered a hotspot.

A plant contributing to a hotspot would then have to go beyond the uniform minimum control guideline for that industry. This is where you take in the element of the effects of the toxics on the water, and design the control strategy to the particular discharger and the particular stream.

First you have the minimum floor and further controls where needed, set on a case-by-case basis.

Mr. MOODY. So you recognize the need for variability but it would be up from a certain floor?

Mr. WEISS. That is right. But without the floor, pollution control would drop precipitously, as we found before 1972. That is why pollution controls did not work.

This committee back in 1972 and 1977 reaffirmed the uniform control approach, deciding that the case-by-case pollution controls simply did not work.

Mr. MOODY. Mr. McComb, anything to add to that?

Mr. MCCOMB. No, sir.

Mr. MOODY. Thank you very much.

Mr. ROE. I hadn't planned on taking too much time on this, but I think that the gentleman from Wisconsin has hit upon an extremely important point in the entire unfolding of our review and debate of this entire issue.

He speaks to—and we have had some exchange of views—what is economically achievable. I think that as we get into the philosophy and the engineering facts involved, that we miss that point.

We miss the point because I don't think when somebody is being poisoned that it is debatable whether it is economically achievable or not.

We have those systems existing right now, as you know, in the country. I am thinking about Love Canal. I am thinking about the dioxin issue.

In my own State we are drowning in dioxins right now. So what is going through my mind intensively listening to this initial review, and I plan on—and I know that my friend and I plan on calling you back again for further elucidations as we unfold more of an in-depth understanding of what the problem is. But the thought occurs to me along the line, and I have to say this, I think it is important, that half of nothing is nothing.

We can have all the ideas in the world, but if we are not going to put the economic resources to work to achieve those goals, it isn't going to happen. Particularly when we have a $198 billion deficit that we are faced with and that sort of issue, I know you have all spoken to and we are all aware of.

But then it comes down to the point does the health of the people, should the health of the people and the quality of the water they drink and put into their bodies to survive be a measure of a priority in a national deficit issue?

I am sad and sickened by the fact that we have reduced State aid from $4.5 billion down to $2.4 billion, as you know. And the fact that we have hundreds of projects, sewer construction projects throughout this Nation that are stopped or standing still simply because the resources aren't there to do it.

One thing I would like you not necessarily to discuss today but think about when we meet again as we unfold this situation again, is maybe we should be talking about resources for the essential needs of society.

You can't play all the instruments in the band. If Congress is going to make valid decisions, reflecting on interest rates and all the things, we have to come back some place and say we are kidding the American public and we are kidding ourselves and wasting our time unless the Congress of the United States is willing to recognize that water quality and the very life of people has to carry some super-position as far as priority is concerned. And it is not one of the things that can be mixed into all of the 10 thousand things we have to look at to run Government.

I would hope you would look to that issue. It doesn't have to do with donkeys and Democrats. It doesn't have to do with elephants.

The issue is, is it a 98 percent priority from the Harris polls? Is that what they want? Will they spend a hundred more?

Maybe we should be isolating or setting up some kind of special funding mechanism and saying that is something that belongs to the people's health. It is not something that falls in ten thousand other categories so that we are competing in bombs and I don't mean to bring that up or competing in other issues, in international trade and everything else, because if we don't have the water quality we are not going to have the production.

Mr. WEISS. Mr. Chairman, I couldn't agree with you more. One thing you mentioned is the need for more funding for the construction grants program.

One of the best features of H.R. 3282——

Mr. ROE. If the gentleman can just hold on that thought. Please pardon me for interrupting.

Mr. WEISS. Sure.

Mr. ROE. I am not so sure that more money anyplace solves problems unless it is properly directed. I, for one—and I can't wait until EPA testifies—am very disappointed, and you know that in the way they have carried out and taken so long.

Here it is 10 years later and we still don't have the toxic requirements that are needed to go ahead and get the job done in the first place simply because the agency didn't perform. Not the people who were supposed to be bad guys, so as to speak.

Mr. WEISS. Hopefully, that will be corrected under the leadership of this committee and H.R. 3282, which does restore money for the construction grants program.

We believe combining that with the excellent reforms made by this committee in 1981 in that program should lead to improved

sewerage treatment. Additionally, I would like to add one more comment about the Harris polls.

When people were asked "are you willing to pay $100 more a year in higher prices and taxes" to get clean water, 70 percent of the people said yes, they were.

But what they did not know is that that would, in effect, double their current contribution per capita to clean up water pollution. So folks were very willing to, in effect, double the amount of money that we currently pay.

Mr. ROE. All I am trying—I don't expect to come to a conclusion today. You know, we speak philosophically, but, you know, OK, but not in my backyard. I want you to think about, are we missing something?

The purpose of these hearings—and I am taking more time, if my colleagues would forgive me, the purpose of these hearings is not to rehash the old set of bones, if you will pardon the euphemism. It is not my direction to say what we did 10 years ago is right today.

I think you have all spoken excellently to that issue. We have learned. What I am simply trying to get at is I am not so sure changing language and adjectives and dates are the answer to the issue.

In fact, I am not so sure I believe they are. I do think we have to take another look and we have to come back and say where have we failed and why did we fail? In part, we have.

Was it lack of funding? Was it lack of knowledge?

Was it lack of administrative ability? Was it lack of political attention?

Was it trying to put part of the cost to the States that can't bear it? Do you understand what I am trying to get at?

So I think if I could leave you a charge in coming back for the next gathering is to look at that issue specifically, and be able to come back to this committee and say that if we truly are going to make the kind of investment that must be made to meet even these medium level achievements for the next go-round. Then where does it come from, and do we prioritize? Do we set up special funding?

Do we prioritize a funding mechanism that is not contaminated by budget deficits to that extent? How important is clean water and what investment do people want to make in it?

That can't be philosophical. That has got to be specific.

The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

Is there any way that BAT is related to non-point source pollution?

Ms. NEWSOME. No; if you mean best available technology, those are the controls on industrial discharges that come out of a pipe.

Mr. ROWLAND. Right.

Ms. NEWSOME. For nonpoint pollution, the kinds of controls we are talking about are usually called best management practices. They are techniques such as contour plowing or no-till farming, rather than a treatment of a discharge coming out of a pipe. Is that what you were asking me?

Mr. ROWLAND. Yes, I think that is—best available management techniques refer more to the nonpoint pollution problem.

Ms. NEWSOME. Right.

Mr. ROWLAND. Thank you.

Mr. ROE. The gentleman from California, Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman.

I note Mr. Weiss, in your testimony, or in your printed material, that approximately half the States are opposing this proposition. Why?

Mr. WEISS. Well, these States have a number of reasons. First of all, many of these States happen to have good clean water programs. California for example.

They see these regulations benefiting the less forward thinking States because those would be the States that have not yet cleaned up their waters, and would be able to weaken their water quality standards.

Their concern is that they have done a very good job or started to clean up their waters. States that have not done that would be able to take advantage of the situation.

Second, implementing these proposals at the State level would be extremely costly in terms of financial resources.

As you know, your own State is going through a budget crisis. That is true of States across the country.

Third of all, these States share a commitment to clean water and believe that the existing act is strong enough and the existing rules do the States a favor.

As Clint Whitney from the State of California said last fall, the Federal clean water act acts as a, gorilla in the closet. When a State wants to implement tough pollution controls to clean up their waters, and industry complains, the States can say, hey, the Feds behind me are making me do this.

These proposals, would change that gorilla in the closet into a monkey, and would make it very, very difficult for the States to say that. Then that would put them under great political pressure to weaken their standards or degrade their water.

Mr. PACKARD. Your polls show and your testimony indicates the people would be willing to pay $100 in taxes in order to clean up the water.

Yet in reality, we find all over this country where the people are crying out against higher and higher and higher taxes. This may be so because most of our polls are taken in isolation.

The issue is in isolation. At the same time, the people are being asked would they be willing to pay $100 more taxes for clean water, they are being asked for another $100 for more schools, another $100 for more parks, another $100 for this and that.

In States like mine, at least there has been a tax rebellion where they say, no, no more. Yet, we impose higher and higher regulations and requirements at the Federal level.

That is why there are 22 States that are opposing, because your second point was very much to target. They are reaching the point where they can't live and raise enough taxes in order to comply with all the regulations.

I am certainly not suggesting dirtier water or dirtier air or anything, but it is a dilemma. I guess the real answer is that we have

to strike a balance between what the people are willing to live with in terms of water quality, and what they are willing to pay for in terms of cleanup process and taxes.

That balance is not always best mandated at the Federal level. That is another reason that you have perhaps 22 States, alluding to your third point, and that is that some do a job on their own, and others don't.

It is a legitimate question that these States are asking. Why should we be penalized and have to come up with greater and greater stringent programs where there are other States that are not doing even up to a standard.

Mr. EDGAR. Would the gentleman yield?

Mr. PACKARD. Yes, be happy to.

Mr. EDGAR. Thank the gentleman for his comments. But I might indicate that I had an opportunity to speak before a large group here in Washington that had come from all over the country, talking about the issue of the Clean Water Act and its provisions.

It was the water office in California that came up to me afterwards and indicated the very point that Mr. Weiss was making. That is that they need strong regulations at the Federal level so that California in turn can keep some strong controls on their industry, both in best available technology and best available management.

I was struck by the fact that it was the California representative who represent the State agency, now under Republican leadership, who indicated they really respected the Federal Government's strong position on this whole act of clean water.

I think the gentleman does make an interesting point, that we are asking people for more and more taxes.

Surveys in my area indicate that while people want less and less taxes, they also want more and more services. They want the Government to come in and find the Love Canals and valley of drums and point source pollutions that are dirtying their waters.

There is not only what you indicated is a balance necessary, but I also think that in some instances, the word is not balance, but it is setting up some priority as to what is available for future generations.

One of the things that the Clean Water Act states is what is valuable for future generations is water that is swimmable, fishable, drinkable.

I thank the gentleman for his point. I just wanted to raise that point, that the California offices have been asking us for, to at least keep fairly strong provisions in place.

Mr. ROE. Will the gentleman yield?

Mr. PACKARD. Certainly, Mr. Chairman.

Mr. ROE. I think you are both coming on to the point I was trying to make earlier.

You know, when we had the confrontation which is unfolding vis-a-vis the point of view the toxic waste disposal mechanism, thinking of Superfund, we are talking of billions of dollars involved.

I mean the part of the concern was the $1.6 billion, although an enormous resource, was small in order of the magnitude of the problem the country is faced with.

The country is faced with those problems because we allowed it to happen. I use the pluralistic there because the Nation allowed it to happen. I think both the gentleman from California and the gentleman from Pennsylvania are thinking along the same line I am. Is that what kind of commitment to make? How do we make that commitment? How do we fund that commitment?

For example, and I just use this as a thought process, if there is a dollar checkoff that people can deduct from their taxes to go to participate in the democratic system to elect representatives, this is done in States now and so forth, and if we were saying to people, yes, if you are going to have a dollar or $5 checkoff, it will go specifically in a trust fund to improve the water resources of America and be allocated for that purpose and not in competition with general funding.

So people could at least in some way be selective to the area where they want to put some of their investment and be sure it goes to that area.

Mr. PACKARD. One other point, then I will conclude, Mr. Chairman.

One of the things I like about the work we do on this committee is that we evaluate projects and programs on the basis of cost/benefit. There is a ratio set up to make certain that projects fit within a criteria that means that we are getting our value out of the dollar that is spent.

In setting up regulations, I think we need to think in those terms also. It is easy to pull out of the sky a requirement that is very nice. It is a motherhood issue, but maybe totally unachievable in terms of dollar value.

I think that when we set up regulatory legislation, we ought to evaluate each parcel of that regulation in terms of its cost to benefit ratio.

We don't tend to do that when we think of regulation. We do in projects but not regulation. Somebody pays the bill on the implementation of every bit of regulation. That ought to be thought out in terms of, is the benefit worth the cost?

Mr. WEISS. Mr. Packard, it will reassure you, I hope, that a number of studies have indicated that the Clean Water Act has led to a net economic benefit because of the health problems prevented, because of the jobs created and that sort of thing.

Second, you mentioned earlier about the demonstration of commitment.

You know it is easy for people to tell a pollster that they want to pay $100 more for clean water. Well, for instance, the community of Providence, R.I., was faced with building a sewage treatment plant. The people there voted to tax themselves another $90 million to build that sewage treatment plant and clean up the Narragansett Bay. That was in a referendum and passed, I believe, with 60 percent of the vote a couple of years ago. So we also have these other sorts of indicators like real votes on bond issues as in Providence that indicate yes, people are willing to spend the extra $100, and not just tell Lou Harris that.

People are really willing to put their money where their mouth is, when it comes to clean water.

Mr. ROE. The gentlelady from New York.

Ms. FERRARO. Thank you, Mr. Chairman. I would yield to my colleague on the subcommittee.

Mr. ROE. I just asked him to yield to you because you are prettier than he is.

Ms. FERRARO. We were just discussing which one was stronger on the committee. I see that he wins.

I just wanted to associate myself with the chairman's remarks with reference to the costs of these things, and prioritizing seems to be the direction we are going to have to go.

I am a Lou Harris fan. Nonetheless, when I take a look at that poll, it would seem to me that what has happened is that the perception of the public has heightened regarding the problems of air and water pollution and I think that is terrific.

I think that has happened over the last several years because of things like Love Canal.

Again, when you get down to would you want to pay $100 more, you might want to if it was something you would see an immediate result for in your neighborhood as that referendum, but when you talk about raising people's taxes by $100 bucks and it just goes into the general treasury and they have to rely upon us down here, I don't know about people throughout the Nation, but I know how people in my district feel about that.

Let me say there is something else besides whether or not it is—the things we are talking about doing with reference to the Clean Water Act are available in terms of dollar value. There is something else. That is how do we settle the competing environmental problems? I think one of the things that occurred last week, Mr. Chairman when you and I participated in a meeting with reference to hot spots on the Hudson River. You know Mr. Weiss indicated EPA should identify and remove those hot spots. Then I believe it was Mr. McComb indicated storage and replacement of toxic waste is a real problem in the country, and it is.

What do we do? We go to the hot spots, pick them up and other people certainly don't want them put on their property. I don't blame them. I wouldn't either. What do we do with them? How do we get rid of them? We don't have an incinerator large enough to take that sludge from the bottom of the Hudson River. What do we do with that once we have it picked up unless we come up with an idea like the pet rock, you know?

But what do we do with it? So there is more than the money problem. There is the second problem of environmental concerns which arise.

Mr. WEISS. Hopefully in a situation like the Hudson River where you are going to require additional clean-up requirements of the dischargers, they are going to have to pay for cost of removing additional pollutants. That creates an economic incentive for firms to develop techniques that recycle or reuse their wastes, and in a way that produces some income.

For instance, there are electroplaters in Rhode Island that have to pretreat their wastes—remove the toxics before they discharge their wastewater into the sewers. What they have found is that they are recycling a lot of the metals they used to just discharge into the sewers as waste.

Mr. ROE. If the gentleman would yield, that is—and I respect your judgment and background—but that might be a little simplistic because let me tell you something.

When we had the meeting with the Senators and Representatives from both New York and New Jersey it hinged upon the quarrel as to what EPA was going to do to clean up those upper hot spots. Those are not hot spots that are being generated. They are there now.

A lot of the work we are doing is going back and cleaning up. Then it turned out the funding Moynihan had in his bill to get that work done was one confrontation. Superfund got into it and that was another confrontation. Would you believe under the same agency there were two exact opposite lists of criteria involved?

Here you have the same agency, two potential pieces of legislation; they had developed different criteria for the same issue. Total, utter frustration.

Inability to determine should it be capped. Should the material be taken out of there? Will the dredging of the—dredges create a problem where it will be disseminated throughout the water?

Should it be put on the land? What will it do to the ground water supply? It reminds me of the giant with the Lilliputians and the little pieces of thread. They couldn't use the thread to make a decision. There are 400 to 500 percent additional PCB's going into that river every day. So we are coming back and saying we are not satisfied in the decisionmaking process. You will pardon my enthusiasm. I meant to be quiet this morning.

What we have invested is billions and billions of the taxpayers' dollars and we have made progress and we have written laws and amended the laws and we have worked and we have amended and so forth. In a lot of respects, we are still playing with the same deck of cards.

In the meantime, not one spoonful of PCB's have been able to be taken out of that river because EPA, in its own way, won't allow it to be achieved.

Now, something is wrong with the process. Money isn't going to solve that. Philosophy isn't going to solve it. Somebody has got to come back and say, hey, fellows, it has got to be moved. I don't want to get into the whole business but that kind of sums up our debate that day.

Ms. FERRARO. Thank you, Mr. Chairman. It does exactly.

I think it points out the additional problem besides money. There are other problems we seem to create for ourselves.

Another question I had was with reference to urban, nonpoint source situation you brought up, Dr. Dysart.

On page 21 you talk about urban runoff. You say one reason for this lack of implementation in reducing nonpoint source pollution is the prevailing perception that the problem of nonpoint pollution is enormous and that remedy is extremely difficult to devise.

You say that perception is incorrect. Could you expand a little bit on that, because you do not further on in your testimony. You merely say that it can be controlled through management practices targeted at those areas.

Dr. DYSART. I think the reason the perception is there that it is so great, so large, is that for many years, for decades, the Congress,

the environmental engineering profession, the State agencies, consulting engineering firms, have been coping with point source pollution. So I think people are much more comfortable in feeling that they know how to approach that. I think many of the institutions and individuals who were doing a good job with point source pollution have not paid too much attention to nonpoint source pollution.

This has been related to other agencies of government, other committees of the Congress, other professions, other areas.

I think that now the problem appears to be so enormous because we haven't been working on it so long.

In my own opinion, this is simply a matter of what we refer to in environmental engineering as unit operations, unit processes, physical, chemical, biological processes can be brought to bear on this.

In my own opinion and the federation's opinion, a great deal of the technology of the design and engineering profession and the agencies of Government can be brought to bear on this if, as I said in my testimony, there is a commitment on the part of the Congress and everyone else that this is going to be dealt with.

Do you have anything to add, Sharon?

Ms. NEWSOME. Well, I would just add that under section 208 of the Clean Water Act between 1974 and 1981 all of the States participated in developing plans which included management practices and techniques for controlling runoff and controlling nonpoint pollution.

Forty-nine of the States in fact had their plans approved, and so, by saying that we now are at a point where it looks enormous but it is not, really. I think what we are saying is that a lot has been done, a lot of study has been done.

These techniques and management practices have been identified, but very few States are using or implementing those practices.

Ms. FERRARO. Is that because of the costs?

Ms. NEWSOME. In some cases there is little or no cost for the management practices. In some cases they are merely a different way of doing things. For the Department of Agriculture they have been working on soil erosion for 30 years. In many cases it is just that some farmers are doing a good job of controlling soil erosion, while others are not.

We just need to get more people doing the right thing.

Ms. FERRARO. I guess I really was talking about urban runoff when I asked about costs because I would assume that some of those pollutants come from stuff that is used by us in the city to de-ice our streets when it snows, and bridges and stuff like that. Is that the type pollutant you are talking about?

Ms. NEWSOME. Yes, I am. Under the national urban runoff program, that is being run by EPA, they are looking at 28 metropolitan areas. What they are finding is that in most cities you can control runoff from a few areas, and control most of the problems.

For instance, industrialized areas of the city often contribute most of the pollution because that is where you are getting most of your chemicals and where they often have disturbed land that is not covered with grass or whatever, and that, by controlling runoff in those areas, either through cachement basins, or some other ways of holding the water to let it settle, you can control the runoff and how much contaminants you have in it.

They have also found that in residential sections those areas that are very dense, where perhaps litter pick-up and trash pick-up is not as good as it is in other sections, those sections are producing most of the contaminants. So that you don't have to have a very intense program throughout a city, but you can target the use of your funds and your practices for those areas.

Ms. FERRARO. Thank you very much.

Thank you, Mr. Chairman.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. Thank you, Mr. Chairman. I want to thank all of the panelists for their contribution this morning and particularly I want to thank the panelists for their specific recommendations.

I noted, for example, the recommendation on section 505 to make that comply and allow people to have an access throughout the courts.

I will try to get some more definition for the amending process. I think that is an appropriate process for looking at the legislation. I think what I have heard generally from you all is that you like the fact that this committee has come up with a bill that is generally favorable in the area of the Clean Water Act. Is that not correct?

Dr. DYSART. That is correct, Mr. Edgar.

Mr. EDGAR. I wonder if I could get us to focus on two other issues that are before us in the next couple of days?

One, we don't have to spend any time with. That is the fact that on the RCRA bill which is going to be on the floor later this week, I will offer an amendment which has the support of our chairman and also Jim Florio, who is chairman of the subcommittee that deals with resource recovery to establish a national ground water commission, and we need your help in talking with the members' offices about the value of the problems we face and the need for good analysis in the whole ground water and infiltration of that ground water supply.

But the second point I want to make, and I think is much more important; that is, tomorrow we are going to mark up a bill in this subcommittee dealing with an omnibus water bill. Over the past couple of years, many of you and your staffs have worked with me and others to try to hold up the process of an omnibus water bill because of policy concerns we have.

We have been talking this morning on clean water about policy concerns, best available technology, best available management techniques, whether dates should be put in place.

I am sure when the Clean Water Act was first put in place, there were some hopes, and it didn't go as far as everybody wanted it to go, but you know we have been working with it and nourishing it over time.

But it was a significant step in the right direction.

I would like to suggest that the bill that Congressman Roe and Congressman Stangeland and others have worked on that is going to be dealt with tomorrow is a very similar bill. That, in fact, if you think of it in terms of a hundred mile distance, and the fact that for the last 20 or 30 years in Congress we have been at the 20-mile mark, namely, in the way we have selected projects, the way we have argued about specific projects being negative, not always meeting the cost/benefit ratio, a lot of times in the legislation

waiving the cost/benefit ratio and approving projects because of certain special interests or individual members who have particular priority, I think that the bill we are going to be marking up tomorrow moves us almost to the 80-mile mark.

That is, we deal with a minimum cost-sharing of 25 percent, from zero to 25 percent makes a lot of sense to me. We deal with water supply in terms of a loan fund to provide replacement of water supply systems.

We deal with the cost sharing above 45 feet, not as much as some of the environmental community would like, but at least force 50 percent of that cost-sharing on to local communities.

We do put an environmental protection and mitigation fund together, putting emphasis on mitigation.

We have funds in there for the Tennessee-Tombigbee waterway mitigation plan. All of us have been angry about that project. It is now about to be completed.

At least we are going to mitigate some of those funds.

We go on further in that bill to establish the National Board on Water Resource Policy to try to return back to at least some principles and standards in the legislation.

We deauthorize almost $11 billion of projects. They are not all the projects that some of us would like to deauthorize, but I think we at least say that deauthorization is not a dirty word; that there can be a process put in place to deauthorize all these projects. Now, there is another 20 percent we would like to go.

Perhaps more cost-sharing, perhaps trying to weed out some of the individual projects that might be in this bill that are a problem. There are some amendments that are going to be offered to look at some of the issues that are raised by the bill, but I guess I am making a statement more than asking a question, and that is that I think those of us who have tried to carry a lot of the environmental concerns and issues have to begin to look at ways in which we cannot only be positive, but work with some of the people in our community to understand that we may have in fact made some headway.

For example, I think we might want to celebrate some of the specific reforms in the legislation and not get ourselves in the position of being confronted later with a much worse bill if we don't move in this direction.

I wanted to take this time to share this with you because it seems to me we have little time to fashion the bill that we are working on. We are under great time pressures. We will be in an amending process tomorrow. We will need a great number of your staffs involved in the process and looking at amendments. I hope as you go back and look at the bill real carefully that you will kind of measure the positives versus the negatives in the legislation because my experience in the brief 9 years that I have been here is that it is the first time that we have been able to get this committee and the Congress to deal seriously with policy decisions.

All along I think it has been, at least most of the environmental concern, that the Nation develop a national water policy, that we list out some policy options, that we know what ground rules are and that we get away from kind of the business as usual process here.

So I am making the argument that I think we are going at least in the direction of the 80-mile mark and that the last 20 miles we can fight another day.

So I urge your help and support, at least in those positive areas we have been working for over all of those years.

Mr. WEISS. Well, similarly we are at the 60-mile mark with the Clean Water Act, and the Howard bill, H.R. 3282, would take us to the 80- or 85-mile mark.

Mr. EDGAR. Thank you. I yield back my time.

Mr. ROE. Are there any other questions of the panel?

We want to thank you very much. We have kept you longer than we intended to, but I think your contribution has been extremely important.

Please review some of the thoughts we have had a chance to exchange. We are going to look to be calling you back when we meet again in September.

Mr. WEISS. Thank you, Mr. Chairman.

Mr. MCCOMB. Thank you very much.

Mr. ROE. I realize it is a few minutes after twelve. Be that as it may, the committee is going to go right on through because we have had witnesses waiting quite some time now. Time is our enemy.

Our next witness is Mr. Paul Freese, chairman of the Water Pollution Control Federation government affairs committee, to be accompanied by Mr. Robert A. Canham, executive director.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY ON 1983 AMENDMENTS TO THE CLEAN WATER ACT FROM PAUL V. FREESE, CHAIRMAN OF THE WATER POLLUTION CONTROL FEDERATION GOVERNMENT AFFAIRS COMMITTEE

INTRODUCTION

Good morning Mr. Chairman and members of the water resources subcommittee. I am Paul V. Freese, chairman of the Water Pollution Control Federation's government affairs committee. With me today is Mr. Robert A. Canham, executive director of the Federation, and Mr. Andrew E. Stevenson, director of public affairs.

Our president, Mr. Charles H. Jones regrets that he is unable to present our testimony in person. He has asked me to share the Federation's thoughts with you today. I am happy to do so.

You are probably aware that the Water Pollution Control Federation is the largest nonprofit, educational and technical association in North America that deals with clean water issues. Our 30,000 members come from all portions of the professional spectrum. The Federation is composed of 44 State and regional associations in the United States and Canada. It is also affiliated with 21 similar organizations around the world.

WPCF is not a lobby. It is a forum in which clean water professionals can discuss all aspects of a national campaign to improve and maintain water quality. Consequently, my remarks represent the general opinions of a majority of our membership and, I believe, of professionals across the country.

PROGRAM AUTHORIZATIONS

WPCF supports the research, development, and training programs contained in Section 104, 106, 112, 314, and 517. The Federation believes that the training and manpower forecasting programs in Section 104(u) and the State management programs in Section 106(a) contribute directly to the goals and objectives of the Act. WPCF also suggests that the Clean Lakes program of Section 314 deserves to be continued.

The programs in these sections support effective management of many other activities, the NPDES permit and the municipal construction grant programs among them. They also support continuing research into some of the basic questions about pollutants. These questions must be answered if our knowledge of the problems is to grow. Training programs are important because they prepare the next generation of pollution control professionals. As a minimum, WPCF recommends continuing these programs at their current authorization levels. We will need technically skilled people who are willing to make wastewater control a career if this country is to receive the full benefit of all clean water programs in the years to come.

MUNICIPAL CONSTRUCTION GRANTS

WPCF supports continuation of the municipal construction grants program. Two position papers—one from 1981, one from 1982—describe a plan for completing that program.[1] In fact, the 1982 position was a direct result of a question put to the Federation by a member of this committee in 1981. Briefly, the Federation recommends that Congress take the following steps when it consider reauthorizing the program:

(1) Set a completion schedule for the program;

(2) Endorse the concept of self-supporting municipal treatment authorities that can finance maintenance, operation, and capital improvements on their own, after they have met the requirements of the Act;

(3) Reaffirm its original intention that the grants program is a "one time only" opportunity for municipal treatment authorities.

The Federation developed these suggestions after much internal discussion. They represent a majority opinion of the membership. We believe they are compatible with the 1981 amendments to the construction grants program. The Federation's rule of thumb is this: Congress should support the grants program with appropriations that will meet the basic treatment needs that remain.

AREAWIDE PLANNING PROGRAMS

WPCF supports continued federal funding for regional and areawide planning. As technology-based controls are supplemented with water quality-based controls and nonpoint sources become more important, such programs will be important ways to coordinate monitoring, analysis, standard-setting, and enforcement.

NONPOINT SOURCE PROGRAMS

Pollution from urban and rural nonpoint sources (NPS) may prevent some streams from meeting their designated uses. Whether instances of such pollution are widespread enough to constitute a national problem remains to be seen, however. Nonpoint sources are difficult to control with conventional treatment systems and "end-of-pipe" technology. Each situation has unique features that must be assessed before controls are applied. For these reasons, a decision to create a national control program cannot be made lightly.

WPCF issued its first position paper on rural nonpoint sources in 1981.[2] At that time, the Federation concluded that too little was known about the various forms of the NPS problem to permit setting national control levels. Despite the many hundreds of research and demonstration studies that have been done on different aspects of the problem, this country still does not have a central information source at which studies can be compared and coordinated. Therefore, one of the first steps to take is collecting and analyzing the information that we already have.

A second aspect of the problem that this committee should be aware of concerns the benefits that NPS controls produce. In some cases, obtaining one benefit can mean giving up another one. As our position paper states:

"Unfortunately, not all of these benefits can be realized at the same time in every case . . . Sediments fill up reservoirs, reducing their storage capacity and shortening their useful lives. Controlling sediment flows into reservoirs can prolong their lives. But sediments also bind pesticides, excess nutrients, and even toxic chemicals. Caught behind a dam in bottom silts, these pollutants do not affect water quality farther downstream. Slowing the buildup of sediment also slows down the removal

Available as separate reprints.

[2] "Controlling rural nonpoint source pollution;" Journal Water Pollution Control; April 1981. Available as a separate reprint.

of other pollutants. When is sediment control more important than pesticide, nutrient, or toxic removal?" [3]

Mutually exclusive benefits occur in other instances as well. Groundwater recharging, for example, may be possible only at the expense of controlling euthrophication and steamside ecological systems. In another situation, salinity control might require changes in the types of irrigated crops grown because control could keep more salts in the soil.

The question of salinity brings us to the third aspect of the NPS problem that will interest this committee. In many rural and agricultural settings, nonpoint sources are not thought of as pollutants. Over time, people making their livings in such settings adjust to the phenomenon and even use it to their advantage. Irrigated farming operations, for example, accept increased salinity as a consequence of their production methods. And the consumer benefits from this trade off. Are controls worth the price we might pay by changing crops or raising prices on crops that require more water? Answering this question goes beyond the issue of water quality.

We can also ask this question of other activities that contribute to the NPS phenomenon. It is relevant to silviculture, to pesticide application, and to fertilizer use. Controlling a water quality problem may mean creating some other type of problem. WPCF suggests that Congress needs more information about the ramifications of such controls before requiring them as federal policy.

While we are still some distance away from collecting and synthesizing the knowledge we have gained on rural nonpoint sources, U.S. EPA has made good progress toward improving our knowledge about urban runoff. In 1982, the agency published preliminary results of a study called the Nationwide Urban Runoff Program (NURP). Final results have yet to be published, but the data gathered under that project exceeds all prior studies in its depth and validity, according to NURP's managers.

The tentative conclusions of that study will interest this committee. We do not present them as the last word on urban runoff, but they do appear to be the latest word. For example, on the question of how runoff affects fresh water aquatic life, the study notes that:

(1) Half of the substances on EPA's priority pollutant list sometimes occur in urban runoff.

(2) Heavy metals such as cooper, lead, and zinc appear more frequently than organic pollutants from the list do.

(3) High concentrations of heavy metals are found frequently enough in urban runoff to pose some chronic risk to beneficial uses. But the degree of risk is not great enough to become a serious local concern.

I will not take any more of this committee's time to also present the tentative conclusions about impacts on the other beneficial uses of marine aquatic life, recreation, and public water supply. They are summarized well enough in Chapter 6, Volume I of the project. Generally speaking, however, project managers have concluded at this point that most beneficial uses are not being systematically denied for long periods of time. Where urban runoff creates water quality problems, they seem to be local in nature. They do not appear to warrant a national control program. Given our knowledge about rural and urban nonpoint sources at this time, WPCF does not recommend that Congress create a national control program for either aspect of the problem. For rural and agricultural nonpoint sources, we need to review the data and information we already have. For urban nonpoint sources, we need to complete the EPA study already underway and then move on to evaluate runoff controls.

DEADLINES; FOR EFFLUENT LIMITATIONS AND PERMIT COMPLIANCE

In 1982, WPCF testified before this committee in support of extending the compliance deadlines for direct industrial dischargers.[4] We do so again this year. The Federation feels that final promulgation of the effluent limits remaining from the 1976 consent decree is a highly urgent matter. The exact length of a permit extension will depend on the resources Congress directs EPA to expend on promulgating those limits. Therefore, WPCF reserves judgment on proposals for a flat 3-year extension of the current deadline of July 1, 1984.

[4] "Testimony of E.J. Newbould, WPCF President, before the House Public Works Water Resources Subcommittee, July 28, 1982, regarding H.R. 6670"; available on request from the Water Pollution Control Federation office of public affairs.

OCEAN DISCHARGE WAIVERS

WPCF favors the consideration of ocean discharge as a possible alternative to secondary treatment, where circumstances permit. The Federation accepts the criteria in Section 301(h) as a reasonable basis for reviewing applications for waivers. We understand that some congressional supporters of a strong Clean Water Act are afraid that existing language can be interpreted to allow applications for discharges that would be of less than primary quality. WPCF does not support such an interpretation. As a profession, our understanding of marine ecology is too limited to justify the short-term benefits that such dischargers would bring to individual communities at the expense of longer term marine water quality.

WPCF supports the requirement that water quality standards must exist for the specific pollutants covered by a waiver. It supports the need for a biological monitoring system whenever a waiver is granted. It agrees that applicable pretreatment requirements must be enforced and that a program for reducing or eliminating toxic pollutants from nonindustrial wastes must also be required. And finally, the Federation strongly supports the requirements that modified discharges should not be allowed to add to the treatment needs of other point and nonpoint sources.

WATER QUALITY STANDARDS

In April 1981, WPCF published a position paper entitled, "Improving Water Quality Criteria and Standards." [5] In it we suggested four steps to improve water quality standards. The first step had already been taken by EPA while our position was still in draft form: "presumptive applicability" was eliminated from the regulations. Three steps remain. They are:

(1) Developing concise descriptions of the water quality investigations that are needed to create and revise accurate standards;

(2) Spending more time on local water quality investigations; and

(3) Finding constructive ways to enforce the standards-setting program.

On October 29, 1982, EPA published proposed revisions to its water quality standards regulations and invited public comment on those changes. WPCF reviewed the changes and responded officially on February 9, 1983.[6] In general, the Federation supported the changes that EPA proposed. At the time, we felt that the revisions would fulfill the remaining three steps in our 1981 position paper. We still believe that to be true.

Since EPA's 1982 announcement, however, reactions among congressional supporters of the Act have been negative. Some people are concerned that the agency was "backing off" of the gains made with technology-based standards. They apparently fear that EPA's proposal will open the way to wholesale downgrading of designated uses and thus undercut the need for further pollution control. WPCF does not believe this would be the case.

But the fears of congressional critics can not be soothed by debating the way a regulation may be interpreted and applied. When such critics become convinced that regulations will weaken a program rather than strengthen it, the real question is how much does one trust the implementing agency? Earlier this month, EPA Administrator Ruckelshaus took steps to restore that trust. He submitted a new version of the revisions to OMB for clearance. Press reports on the new proposal indicate that it is designed to allay the fears and answer the criticisms created by the original notice. More recent reports state that OMB has approved the proposal.

WPCF commends Mr. Ruckelshaus for his actions. The water quality standards program is a complex one. It is not fully understood by many people in the water pollution control profession, even today. Working together through informal meetings, legislative and executive branch specialists can, we are sure, arrive at a new set of regulations. Rather than codifying existing regulations or freezing the designated uses already set, WPCF recommends that Congress encourage negotiations between the two branches of government and review the final product.

NPDES PERMITS

WPCF supports changes that will allow States to accept partial delegation of the NPDES permit program. The Federation also supports the creation of 10-year permits. Renewal programs now have a backlog of 5-year permits to review. Allowing

[5] "Improving water quality criteria and standards"; Journal Water Pollution Control; April 1981. Available as a separate reprint.

[6] Letter from Charles H. Jones, WPCF president, to David Sabock, U.S. EPA Office of Water Regulations and Standards; February 9, 1983.

10-year permits will help to reduce that backlog. It will relieve reviewers of the need to check dischargers whose effluent characteristics remain stable for many years. All permits have a "reopener" clause that allows the issuing authority to make any changes that might be necessary during the life of the permit. Thus, WPCF does not believe that a 10-year period will delay the adoption of new controls or the addition of new pollutants when they are needed.

WATER POLLUTION CONTROL FEDERATION,
Washington, D.C., February 9, 1983.

Subject: Comments on U.S. EPA's October 29, 1982 Notice Regarding Water Quality Standards Regulation, 40 CFR Parts 35, 120, and 131; as Published in 41 FR 210, pp. 49234-49252.

Mr. DAVID K. SABOCK,
Criteria Branch, Office of Water Regulations and Standards, U.S. Environmental Protection Agency, Washington, D.C.

DEAR MR. SABOCK: This letter addresses nine major policy changes in the U.S. Environmental Protection Agency's (U.S. EPA) October 29th notice. It does not comment on the specific language of the regulations to be revised. In general, WPCF believes the policy changes proposed will improve the current program. The Federation's evaluation of the agency's October 29, 1982 proposal is based on a position paper entitled "Improving Water Quality Criteria and Standards," published originally in the April 1981 edition of Journal WPCF. A copy of the position is enclosed for the record.

The Water Pollution Control Federation (WPCF) is a non-profit educational organization devoted to developing and distributing information concerning wastewater pollution control. WPCF accepts no money from the federal government for any of its activities. It is composed of 44 member associations in the United States and Canada, and is affiliated with 21 other organizations around the world which share similar objectives. Over 30,000 professionals belong to WPCF, either through these member associations or directly.

Over two years ago, WPCF began investigating the problems that the profession faced when developing water quality criteria and standards. The April 1981 position was the culmination of that investigation. Since EPA's October 29, 1982 notice deals almost exclusively with water quality standards, this response deals primarily with the same subject and tangentially with water quality criteria. WPCF maintained in its position that four major steps had to be taken to improve the water quality standards program. Those steps are:

One, eliminate the policy of presumptive applicability.

Two, explain clearly what it takes to do valid water quality investigations.

Three, spend more time and effort on local water quality investigations.

Four, find constructive ways to enforce standard-setting programs.

Eleven specific recommendations to execute the four steps were also offered in the position.

Where the WPCF position and the U.S. EPA proposal address the same issues, they are compatible. The first step—eliminating the presumptive applicability policy—was actually taken by EPA before our 1981 statement was formally adopted. The second step—explaining the requirements of valid water quality investigations—will be taken when the agency decides to publish a final version of "Water Quality Standards Handbook," provided that guidance includes adequate treatment of the processes for calculating total maximum daily loads (TMDLs) and wasteload allocations (WLAs). The third-step conducting more local water quality investigations—will be promoted by the agency's decision encouraging States to concentrate their resources on a small number of high-priority, water quality limited segments.

It is evident that where the U.S. EPA proposal and the WPCF position address the same issues, they are compatible. Moreover, WPCF perceives in the agency's initiative that another common goal is shared: The adoption, at a later date, of means to forge an enforceable link between in-stream water quality standards and discharge permits. The Federation recommends that work to reach this goal begin immediately.

Details of the areas in which WPCF and U.S. EPA agree are presented below. They are listed in the order of the agency's nine major proposed changes.

1. FOCUS ON PRIORITY WATER BODIES

WPCF agrees with the proposal to end the current requirements that States review all their water quality standards every three years. States must be encouraged to focus their reviews on priority water bodies, especially those segments that are water quality limited. EPA's proposed change recognizes the constraints under which most State agencies must operate and quite properly emphasizes a review system that should result in improved water pollution control.

2. USE ATTAINABILITY

WPCF concurs with the new procedure by which States can examine the designated uses of a given water body and revise those designations if the uses cannot be attained. The proposed process includes assessing the benefits and the cost of attainment for each water body investigated. Both the attainability analysis and the benefit-cost analysis are designed to involve all interested and affected parties. WPCF supports this change with the qualification that analyses involving evaluations of nonpoint source pollution must be reviewed very carefully, given the profession's general lack of information about such sources. (For WPCF's position on nonpoint source control, please refer to the enclosed position paper entitled "Controlling Rural Nonpoint Source Pollution.")

3. TYPES OF CHANGES TO DESIGNATED USES

WPCF supports the proposal to abandon the use of the term "upgrade" and "downgrade" when referring to changes in designated uses. These terms and ambiguous because water bodies often have more than one use. States should be allowed to "add," "remove," or "modify" a designated use under certain conditions. WPCF took this stand in its position paper, saying:

"EPA and state agencies consider defining special water use designations and developing appropriate criteria for: special aquatic habitats, headwater, intermittent streams, and streams containing naturally high levels of dissolved solids or other constituents."

4. LEVELS OF AQUATIC PROTECTION

WPCF approves of U.S. EPA's proposals to allow States to define subcategories of aquatic protection within each use. Such subcategories would specify different levels of protection. This change will result in the need to develop water quality criteria for the subcategories created and is consistent with the notion of modifying a designated use as described above. WPCF supports the change proposed.

5. DEVELOPING SITE-SPECIFIC CRITERIA

WPCF concurs with U.S. EPA that States should be able to modify the criteria for specific segments if a thorough survey of the water body shows conditions support the designated use, even though the existing criteria are not being met. Criteria derived from models uncalibrated for local conditions do not reflect reality. To quote from the Federation's position:

"Analyzing the wasteloads for water quality-limited streams using verified mathematical models that are calibrated with local information.

"Consider setting aside some of the stream's capacity as a reserve for future discharges and as a hedge against error or inaccuracies in the predictions made with the model."

This change follows naturally from the 1980 decision to rescind the presumptive applicability policy. It is consistent with U.S. EPA's proposal encourage States to draw up site-specific criteria that reflect local water quality characteristics.

6. ANTIDEGREDATION AND MAINTENANCE OF EXISTING USES

U.S. EPA's proposal includes the existing antidegradation policy and three alternatives. The agency favors Option 1 over the existing policy or Options 2 and 3. Options 1 and 2 and the existing policy are all compatible with Federation sentiments on the antidegradation issue. The Federation's position on this question is based on a policy adopted by WPCF in 1960. In part, the 1960 position says: ". . . National survival—in terms of future urban, industrial, and commercial growth and prosperity—dictates the protection of all water resources from any acts, such as the discharging of harmful substances, which cause unreasonable impairment of water quality and adversely affect their highest levels of usefulness."

7. PROTECTION OF OUTSTANDING NATIONAL RESOURCE WATERS

EPA proposes to remove that part of the existing regulations which provides for the designation of "outstanding national resource waters" on the grounds that such a designation is not provided for by the statute. WPCF's views on this subject are expressed in item 6 above.

8. GENERAL POLICIES

Current regulations do not recognize the ". . . general policies applicable to States' water quality standards," to use EPA's own phrase. The agency proposes to encourage States to adopt policies that ". . . are generally applicable to a State's water quality standards program such as policies on mixing zones, variances, and low flow exemptions." WPCF does not take a position on this proposal as a general change.

Some of the issues EPA desires to treat as general policies appear consistent with Federation objectives. But the proposed variance to individual dischargers based on economic hardship is difficult to understand. The notion of granting a variance from a water quality criterion (as opposed to a standard) appears to have little value. For one thing, criteria apply to bodies of water, not discharges. For another, criteria do not have the force of regulation or law, so it is not clear how receiving a variance from one would change a discharger's permit requirements.

9. REVIEW AND APPROVAL

EPA proposed to define more precisely the approval process for State water quality standard. The agency's detailed recommendations on this point go beyond the scope of the Federation's position.

Under the current regulations, EPA and the States have had to negotiate their disagreements over a particular standards. The proposed change appears to do little to make the negotiation process any shorter or less complex. This may be due to the difficulty of writing exact regulations for an activity—such as negotiating—that is fluid and somewhat unpredictable by its nature. The element of "good faith" is critical if negotiations are to work efficiently, but good faith cannot be written into regulations.

For this reason, WPCF believes that time will tell whether the proposed change is better than the current policy. The Federation only offers the observation that the proposed regulation appears to place the burden of proof in any dispute on the State. This is precisely where it lies under the existing system.

ADDITIONAL EPA ISSUES

WPCF wishes to comment on two remaining points in this letter. First, under its discussion of antidegradation alternatives, U.S. EPA specifically requests examples of instances where the existing policy has precluded—or might preclude—economic development. WPCF has no cases to offer, since collecting examples of such occurrences is outside the scope of its present activities. However, it is fair to say that instances of the type the agency is interested in have not been brought to the attention of Federation leaders or staff members.

Second, WPCF commends U.S. EPA for publishing a draft edition of the first in a two-volume set entitled "Water Quality Standards Handbook." The draft of the first volume conveniently assembles much of the information needed to carry out the changes proposed in the October 29th notice. WPCF reserves judgment on specific procedures contained in that draft until a draft of volume two (dealing with field tests of water body surveys and tests of the benefit-cost procedure) is released.

Two other documents related to the "Handbook—Wasteload Allocation Guidance" (in draft form since 1981) and the "Benefit-Cost Assessment Handbook" (in draft form since November 1982) are also important. Taken together, these four publications are supposed to completely describe all that is needed to implement to the proposed policy. WPCF recommends publishing the final versions of these documents before a final revised rule on water quality standards is promulgated.

In conclusion, the Water Pollution Control Federation appreciates the opportunity to comment on this action. WPCF congratulates U.S. EPA on the effort that went into preparing the revisions. The Federation believes that the proposed water quality standards program will be more effective than the existing program.

Sincerely,

Charles H. Jones, President.

Mr. ROE. Please proceed.

TESTIMONY OF PAUL V. FREESE, CHAIRMAN, WPCF GOVERNMENT AFFAIRS COMMITTEE, WATER POLLUTION CONTROL FEDERATION, ACCOMPANIED BY ROBERT A. CANHAM, EXECUTIVE DIRECTOR, AND ANDREW STEVENSON, PUBLIC AFFAIRS MANAGER

Mr. FREEZE. Thank you, Mr. Chairman.

Mr. ROE. Now, if I can offer a suggestion, you understand the time restraints. We don't want to reduce you; we will be calling you back anyway. I would ask unanimous consent your testimony be included in full in the record, but give us a summary so we have a few minutes to be able to exchange thoughts with you so our time is productive.

Mr. FREEZE. Good morning, Mr. Chairman. I am Paul Freese. I am chairman of the Water Pollution Control Federation, government affairs committee. The executive director of the federation, Mr. Canham, is here on my right.

Behind me here is Mr. Andrew Stevenson, the public affairs manager for the federation. I will just summarize my points of my formal statement which you have. The order of the topics that I would like to mention are in the same order as they appear in the Clean Water Act.

The first is on program authorizations, the federation supports the training and R&D programs contained in sections 104, 106, 112, 314, and 517. The federation believes that the training and manpower forecasting programs in section 104(u) and the State management programs in section 106(a) contribute directly to the goals and objectives of the act.

WPCF also suggests that the clean lakes program of section 314 deserves to be continued.

The programs in these sections support effective management of many other activities, the NPDES permit and the municipal construction grant programs among them. They also support continuing research into some of the basic questions about pollutants. These questions must be answered if our knowledge of the problems is to grow.

Training programs are important because they prepare the next generation of pollution control professionals. As a minimum, WPCF recommends continuing these programs at their current authorization levels.

Under municipal construction grants, we also support continuing the municipal construction grants program.

We recommend, however, that Congress take the following steps when it reauthorizes this program.

First, set a completion schedule for the program;

Second, endorse the concept of self-supporting municipal treatment authorities that can finance maintenance, operation and capital improvements on their own after they have met the requirements of the act;

Third, reaffirm its original intention that the grants program is a one time only opportunity for treatment authorities.

I will not speak at this point in any detail on that. We will respond to questions if you have some.

On the areawide planning programs, the federation supports continued Federal funding for regional and areawide planning. As technology-based controls are supplemented with water quality-based controls and as nonpoint sources become more important, such programs will be important ways to coordinate monitoring, analysis, standard-setting, and enforcement. Nonpoint sources are becoming more important, as we have heard this morning. Intergovernmental programs such as those in section 208 are needed. Under the nonpoint source program there are several aspects that this committee will have to address if it decides to call for additional legislation in this area.

We need a centralized operation to collect, compare and use the results of existing research programs. Hundreds of projects have already been completed and we need to analyze that information before directing that more studies be done.

Some situations where nonpoint source controls have been considered, it appears some of the benefits are mutually exclusive.

Environmental Protection Agency has made progress in assessing the problem of urban storm water, mentioned just a few minutes ago. Preliminary conclusions from one study suggest that most beneficial uses are not being denied for long periods of time. The problems seem to be local in nature. Thus the Water Pollution Control Federation does not recommend that Congress create a national control program for urban runoff.

We do recommend, however, completion of the nationwide urban runoff project, from which the preliminary conclusions came.

Under deadlines for effluent limitations and permit compliance, we support extending the promulgation deadlines for effluent limits.

The federation feels promulgation of the remaining limits is an urgent matter. EPA needs the full support of Congress in order to finish this job. Since compliance is a function of promulgation, WPCF suggests the period for compliance be based on when they are promulgated.

Under ocean discharge waivers, we favor considering ocean discharge as an alternative to secondary treatment where the circumstances permit. We accept the criteria in 301(h) as safeguards for marine water quality, but we do reject any interpretation of existing language that suggests applications for discharging anything less than primary effluents are permitted. Under water quality standards, recently congressional concern about the implications of EPA's 1982 proposal for revising water quality standards has grown. WPCF believes at this point that the legislative branch must trust the executive branch or no improvements in the current program are going to be possible.

Mr. Ruckelshaus has taken steps to restore that trust. WPCF recommends that the committee wait for the final product in negotiations between EPA and congressional experts before making any changes in the law.

Under NPDES permits, WPCF supports changes that will allow States to accept partial delegation of the NPDES permit program. WPCF also supports the creation of 10-year permits. We feel both steps will contribute to reducing permit backlogs and increasing the amount of attention that goes into each permit review.

I thank you, Mr. Chairman, for the opportunity to present these thoughts to you.

My formal statement has been supplied to you. If there are any questions, Mr. Canham or myself will be glad to try to answer them.

Mr. ROE. We too want to thank you for your comprehensive presentation which basically tracks the legislation itself. I don't have any questions at this time.

Are there any questions from the gentleman from Minnesota?

Mr. STANGELAND. Thank you, Mr. Chairman. Just a couple.

On page one you note that the Water Pollution Control Federation suggests a clean lakes program under 314 deserves to be continued. I think you will find a great deal of support on the subcommittee for your position.

Would you kindly provide, either here or for the record, a little more detailed explanation of why you believe the clean lakes program is important and why it should be continued?

Mr. FREEZE. We will be glad to furnish that to you.

[The information received follows:]

WATER POLLUTION CONTROL FEDERATION,
Washington, D.C., September 9, 1983.

Hon. ARLAN STANGELAND,
Longworth House Office Building,
Washington, D.C.

DEAR MR. STANGELAND: On Tuesday, August 2nd, during hearings before the water resources subcommittee, you asked three questions of Mr. Paul V. Freese, a witness for the Water Pollution Control Federation. Mr. Robert A. Canham, our executive director, has asked me to respond to your inquiries.

Why should Congress continue funding for the Clean Lakes Program?

The Clean Lakes Program is authorized by Section 314 of Public Law 92-500. It was created in 1972, when Congress recognized the need to support the restoration of freshwater lakes across the nation. Several thousand publicly-owned lakes were in desperate need of resuscitation by the middle of that decade. And U.S. EPA realized that the funds available could not meet all of the identified needs. Thus the agency set as its objective the restoring and protecting of at least one lake within 25 miles of every major population center. Now, 10 years and $70 million later, EPA's goal is well on the way to being achieved.

There are 280 major population centers or "standard metropolitan statistical area" (Hereafter called SMSAs) in the United States. By the end of 1982, 127 of them had at least one Clean Lakes project within 25 miles of their borders. Projects selected for the program produced a very high return for each federal dollar invested. The public benefit ratio is approximately 8:1, according to a 1982 EPA report. Further, most of the federal money invested in the program went directly to cleanup measures. Classifying potential projects took 5.5 cents; diagnosing their problems took 7.5 cents; and carrying out corrective measures took 87 cents of each federal dollar appropriated. These figures demonstrate that the program was largely free of duplication and red tape. The money went to the problems, not to paperwork.

WPCF also believes that the Clean Lakes Program deserves to be continued because it produces a very high level of Federal-State interaction. EPA gave priority to projects in States that promised to assume responsibility for continuing protective or restorative measures once the work was completed. States had to give serious thought to participating in the program for another reason. They had to help local communities come up with the 50 percent non-federal matching requirement. And EPA built on this need by conditioning the award of cleanup money upon local willingness to assume responsibility for other water-related concerns. Immediate corrective actions are best at eliminating the symptoms of long-term pollution. So stressing local responsibility for maintenance made State and community participants look at best management practices and nonpoint source controls on a regional or watershed basis to make sure that their funds were also effectively spent.

In summary, there are several very good reasons for continuing this program. First, it has restored at least one lake within 25 miles of nearly one half of the

SMSAs in the country. Second, it has done so with an exceptionally low level of administrative "overhead." Third, the benefit-cost ratio is approximately 8 to 1. Fourth, Clean Lakes projects have been combined with other federal and state level actions to multiply the total benefits obtained. Fifth, the program has provided valuable information on the effectiveness of nonpoint source pollution control—a subject your committee has become more concerned about as point source pollution is abated. And finally, a sixth reason was offered by your colleague, Representative Hammerschmidt, when he rose to support to $5.0 million appropriation for the program on June 2, 1983.

During floor debates on the HUD-Independent Agencies fiscal '84 budget measure, Mr. Hammerschmidt said:

"We have all become more aware of the need to address various aspects of acid rain pollution problem that is increasingly threatening our environment. The Clean Water Act's clean lakes program is the only program currently in place and operating today which attempts to deal with at least the lake pollution aspect of this problem on an immediate basis. It would be a bad decision, even a foolhardy one, to abandon this program now at a time when our need for it has probably never been greater."

What more can the committee do to encourage self-supporting public utilities?

Federation witnesses have appeared before your committee to offer recommendations on improving the Clean Water Act many times. Each time they stress the need for municipal wastewater utilities to become self-supporting after meeting the requirements of the act. There is no doubt that members of your committee were concerned, in 1972, with the problem of creating an endless federal grants program for municipal agencies. That is why the grants program in Section 201 was tied directly to the goals in Section 101 and the enforceable deadlines for PTOWs in Section 301. A revised statement of that concern is needed today.

The intent of the House is clearly stated in its March 11, 1972 report on H.R. 11896. That bill and its report were the House basis for the conference that produced S. 2770, the measure enrolled and passed over President Nixon's veto at PL 92-500. Regarding the grants program, the H.R. 1896 report states:

"A major new condition for receiving a grant relates to the establishment of user charges. This section (Section 204) specifically provides that the Administrator shall not approve any grant for publicly owned treatment works, after June 30, 1973, unless the applicant has adopted or will adopt a system of user charges to assure that each recipient of waste treatment services within his jurisdiction, as determined by Administrator, will pay its proportionate share of operation, maintenance (including replacement) and expansion costs. The applicant's jurisdiction means his entire service area.

"The Committee believes it is essential to the successful operation by public agencies that a system of fair and equitable user charges be established. The Committee recognizes that differing circumstances and conditions in local areas may call for especially designed systems and has therefore proposed that the Administrator promulgate general criteria and that such general criteria allow for variations to meet local conditions. This section contains standards the Committee believes should be taken into account by the Administrator; foremost among these is the underlying objective of achieving a local system that is self-sufficient." (Taken from House Report 92-911, page 91.)

This excerpt reveals that the House intended the grants program to end when municipal treatment authorities met the requirements of the law. The House intentions were understood and accepted by U.S. EPA's first administrator, William Ruckelshaus. We know this because the House report just cited also contains a letter from Ruckelshaus dated December 13, 1971 commenting on the provisions of H.R. 11896. On the subject of grants and POTWs, the Administrator wrote:

"We strongly support the concept of requiring that grant recipients have the legal, institutional, and economic capability of self-sufficiency. Accordingly, we believe that the funds recovered from user charges should be retained by the communities in support of this important objective." (House Report 92-911, pages 151 and 152.)

Incidentally, the Office of Management and Budget concurred with Mr. Ruckelshaus letter. So House leaders and administration officials agreed in 1971 that the grants program should produce financially independent wastewater agencies. Finally, a statement of similar intent can be found on page 28 of the Senate's October 28, 1971 report on S. 2770, Senate Report No. 92-414.

In spite of this documentation, Paul Freese, the Federation's witness on August 2, 1983, recommended reaffirming your original intentions. He did so because the legislative record on the conference report to S. 2770 does not reflect the same commit-

ments to independence as the pre-conference reports. That record, Senate Report No. 92-1236, describes the conference version of Section 204 of the measure this way:

"The conference substitute is basically the same as the Senate bill as revised by the House amendment with the following changes:

(1) The requirement that users pay for the cost of future expansion of waste treatment services has been stricken." (Page 112.)

Thus, the final version of the Clean Water Act contains a vaguer, more ambiguous reference to the grants program and self-sufficient POTWs. The exact reasons for this softening of concern are not recorded.

We suspect that the conferees believed that the estimated needs of $24 billion given Congress by the U.S. EPA were too low. Indeed, studies done at the time by the National League of Cities suggest a more accurate figure would have been $33 to $37 billion over the period from 1972 through 1977. This range of estimates is more than $10 billion over the figure that the conferees based their grants program upon. So, in hindsight, prudence might have dictated that they temper their language on the subject of self-sufficiency rather than raise false hopes about the final cost of the program.

Eleven years have passed since that legislative conference. During the past decade, Congress remained firm in its belief that user charge systems had to be a part of any grantee's program. It has never altered the language of Section 204 regarding each POTW's responsibility to maintain a plant and replace its components through user charges. Thus the Federation believes that your committee should take this opportunity to dispell any doubts that have grown up in the intervening years regarding the connection between financial self-sufficiency and the grants program.

Why does the Federation feel that a more aggressive national program on nonpoint sources is unnecessary at this time?

In our testimony, Paul Freese took care to say that the Federation does not support a national program of nonpoint source controls at this time. WPCF does support, however, collecting and analyzing the various studies that have been done on nonpoint source problems. This country needs a center for nonpoint source information. With proper organization, that center could be managed so that research and demonstration funds are spent in the most effective way possible.

Nonpoint sources of pollution are, by definition, multi-faceted phenomena. They are difficult to control with traditional "end-of-the-pipe" treatment systems. Whether rural or urban in nature, controlling such sources will take a very high level of management, as distinguished from pure "treatment." Unless we analyze the information we have on the various aspects of the problem within a coherent framework, our plans for control and management will be disjointed and ineffective.

Moving away from the question of national controls, the Federation feels that there is much Congress can do to encourage the development and testing of local control programs. Regional planning programs like those created through Section 208 of the act can be used to implement nonpoint source controls. Special study programs such as those involving the Great Lakes or the Chesapeake Bay also provide a context for local initiatives. Other local and regional efforts would be encouraged by vigorous dissemination of R&D information from a central organization, as suggested above.

WPCF recognizes that nonpoint sources are serious contributions of pollutants in many areas. And, as technology-based treatment requirements are met on more and more stream segments throughout the country, assessing the possibilities of nonpoint sources control in water quality-limited areas will be necessary. Past experience demonstrates that controls make it possible to attain some benefits or uses, but only at the expense of other desirable outcomes. This point is described more deeply in our 1981 position paper on the issue. Thus, combining the fragmented nature of our knowledge about nonpoint pollution with the possibility that benefits sometimes cancel each other out, produces a very good reason why Congress should require the federal government to organize and improve the state of the art for this problem.

IN SUMMARY

Thank you very much for your interest in the Federation's suggestions for improving clean water programs in the United States. I have tried to keep our answers to your questions brief. At the same time, I have also mentioned some of the larger issues that lie just under the surface of those answers.

If you or your staff would like to explore these issues further, please contact me. I would be pleased to provide you with additional information or to arrange for some of our experts to discuss them with you directly.

Sincerely yours,

ANDREW E. STEVENSON, *Director of Public Affairs.*

Mr. STANGELAND. On page two you recommend that reauthorization of the construction grants program should endorse the concept of self-supporting municipal treatment authorities that can finance maintenance operations and capital improvements on their own after they have met requirements.

I believe the concept is already firmly built into title II of the act. If you have any specific thoughts on how we can amend the language to further emphasize the concept, I think the subcommittee would welcome working with you.

On page four of your prepared statement, you conclude while nonpoint sources are an important part of the pollution control equation, they do not appear to warrant a national control program. Many believe nonpoint sources have been inadequately addressed so far in the Clean Water Act and we will never achieve our goals of fishable, swimmable, until we have better solved the problem of nonpoint sources.

Why is it we should not in your opinion embark on a more aggressive national effort to solve the nonpoint source pollution problems?

Mr. FREEZE. It is not that we disagree that there needs to be a national program. We believe at this time there is an awful lot of research work being carried out that is in progress, the results need to be coordinated and understood better in order to have a meaningful national program.

We do not believe the data is in hand to permit the writing of that type of national legislation at this time. We would be glad to give you additional information on that.

WPCF Position Papers

Industrial pretreatment needs to be overhauled at the national level

Pretreatment of industrial wastewaters before discharge to municipal systems is required by the 1972 Federal Water Pollution Control Act. In spite of this requirement and the fact that most municipal treatment authorities have sewer use ordinances on which local pretreatment programs can be developed, many metropolitan areas do not have active control plans. There are several reasons why progress has been slow. Court actions and administrative decisions within the Environmental Protection Agency have resulted in a complex set of pretreatment regulations, the foundation of which—pretreatment standards—has never been finalized. Added to this has been the need to learn more about the kinds of toxic substances controlled under a pretreatment scheme. In this position paper, WPCF reviews the current state of national pretreatment policy and recommends that five steps be taken to improve the program. First, the distinction between direct and indirect industrial dischargers must be recognized. Second, pretreatment requirements for old and new indirect dischargers should be the same. Third, the concept of "indicator pollutants" must be eliminated. Fourth, the removal credit concept must be eliminated as a national requirement. Fifth and finally, the federal government can do more to encourage state and local authorities to develop strong local programs.

Pretreatment of industrial wastewaters has become one of the thorniest issues facing a treatment agency and its industrial customers. The list of difficult questions that must be answered before a local pretreatment program can work is long. In most cases, pollution control experts do not know enough generally about the toxic substances pretreatment is intended to remove or reduce. Biologists and toxicologists do not have enough data to say how much of an aquatic or human health risk is attached to a particular concentration of a given substance. Treatment agency researchers are still working to determine how much of a substance is removed in the normal course of wastewater treatment. Engineers faced with the challenge of developing the equipment and processes needed to control toxic pollutants are hampered by the lack of good information from the other areas just mentioned, as well as by the "moving target" presented them in the form of categorical standards that are never finalized. What can be done to resolve the problems and move ahead with the program?

Pretreatment objectives were put on the national agenda in the 1972 amendments to the Federal Water Pollution Control Act (PL 92-500). At the time, pretreatment was thought to be necessary wherever industrial dischargers contributed organic and inorganic pollutants that could pass through a plant untreated, or could upset the normal operation of a plant. The concept was not a new one. Its antecedent was the sewer use ordinance developed by many treatment agencies as a way to protect their facilities. At the national level, however, the concept was broadened to embrace the hundreds of substances that were thought to be chronically or acutely toxic to aquatic and human life. The 1972 pretreatment program was legislatively joined with an effluent limits system for direct industrial discharges that was designed to evaluate the toxicity of substances on a chemical-by-chemical basis for direct and indirect industrial dischargers. Section 307(b) of the act gave the Environmental Protection Agency (EPA) the authority to write pretreatment limits for any such substance. The limits could be based on either water quality or pollutant control technology criteria. Although EPA could develop standards for direct and indirect discharges separately, it was required to publish effluent limits and pretreatment limits for *ned* industrial dischargers (as distinguished from dischargers existing when the act was passed) simultaneously. No one foresaw there would be serious problems developing both types of standards for both types of discharges, much less new or existing industries.

Unfortunately, the 1972 program

was a failure. Managers of the national toxics control program who wrote effluent limits found that existing biological and toxicological data were inadequate. Collecting a reliable data base for most substances required years of patient work and millions of dollars. Experts within the scientific community disagree—often sharply—over the interpretation of the studies that were completed. Indeed, the very term "toxicity" was open to debate. EPA investigators managed to produce standards for only six substances in 5 years. The Natural Resources Defense Council (NRDC) then took EPA to court, charging that it was dragging its feet on the national toxics control program. A settlement between the parties was reached in June 1976, scrapping the 1972 program and substituting a new one.

Pressure from NRDC and other activist organizations produced a consent decree in which EPA agreed to look at 65 compounds and to consider writing limits for 129 substances (referred to as "priority pollutants"). As part of the decree, EPA also agreed to basing any limits produced on technological criteria exclusively. Those limits were to be incorporated into the permits of some 14 000 industrial dischargers, grouped into 29 separate categories, and further divided into 399 subcategories. Federal District Court Judge Thomas A. Flannery gave EPA 3.5 years to do most of the work (until December 1979). He assumed that the period would be long enough for standards to be written and for industrial dischargers to meet the July 1, 1983, deadline for putting the proper effluent control on-line. Congress revised the act in 1977 to incorporate the court settlement. It also gave industry an extra year to meet its legal deadline by extending the cutoff point from July 1, 1983, to July 1, 1984.

Even with the extra time, EPA found itself unable to produce the standards with the resources at hand. "It is clear," Administrator Douglas M. Costle reported to the principal plaintiff in the court case, "that the task has proven to be far more resource intensive (sic) and time consuming that originally perceived." On March 9, 1979, all parties to the settlement agreed with Costle and recast their compact to extend the standards deadline a third time, the new date being March 1981. But there was a *quid pro quo*. The agency had to agree to an expanded list of subcategories—from 399 to 700. It was a hard bargain: in return for more time, the agency got more to do.

Throughout the process of renegotiation, many people assumed that significant amounts of toxic substances in question were not removed by conventional treatment and passed through municipal plants to pollute receiving waters. However, testimony before the House oversight subcommittee in 1980 revealed that treatment plants were often more effective removers of the toxic substances than originally supposed. The director of EPA's Municipal Environmental Research Laboratory reported that studies done in three municipal plants showed only 37 of the priority pollutants could be detected entering the facilities. "The concentrations measured were generally low . . . and highly variable," he noted. Information independently presented by municipal authorities and industrial waste treatment plant operators supported the agency's findings that well-run biological treatment plant operators supported the agency's findings that well-run biological treatment systems did, in fact, control toxic substances to a significant degree.

Because effluent limits have to be written before pretreatment limits, the pretreatment program languished somewhat while EPA wrestled with the problem of deadlines. But the lack of attention at the federal level was more than compensated by problems municipal authorities and industrial customers found they had to solve before local treatment agencies could make the program work. WPCF's pretreatment task force held a national symposium on the issue in July 1980 that highlighted the trouble spots. From the meeting came five objectives that must be met to make it work better. They are:

- Recognize the distinction between direct and indirect industrial dischargers;
- Make pretreatment requirements similar for old and new indirect dischargers;
- Eliminate the concept of "indicator" pollutants;
- Eliminate the removal credit system; and
- Encourage state and local authorities to develop strong programs.

Objective—recognize the distinction between direct and indirect industrial dischargers

Under the consent decree worked out between NRDC and EPA, technology-based effluent limits (designed to attain "best available treatment" and therefore called BAT limits) have to be considered for different categories of direct industrial dischargers. By the same logic, the pretreatment limits considered for indirect industrial dischargers have to follow the same classification scheme. The Standard Industrial Classification (SIC) Code contains the categories used. It divides businesses into such processes as: electroplating, gum and wood processing, leather tanning, textile milling, and so forth. Each category is further broken down into subcategories of plants using similar processes within a given industry.

Standard-setters within EPA decided that each category had to be investigated separately. Thus the BAT limits on chrome discharged by electroplaters could be different from the BAT limits on chrome discharged by tanneries. Pretreatment limits on chrome could differ the same way. These divisions have created some extreme variations in the

limits proposed, all in the name of trying to achieve economic "parity" between the direct and indirect discharger groups and between industries in each group that happen to fall into different subcategories. Given the lack of hard data on which to base the setting of even a single, uniform effluent limit for all dischargers of a different toxic substance on the priority pollution list, it is no wonder that the search for parity among different groups of dischargers has bedeviled standard-setters since the beginning of the program.

On the question of parity between categories of direct industrial dischargers, investigator James Patterson of the Illinois Institute of Technology found that tentative EPA limits on common parameters showed nearly a 1 000-fold variability. Patterson gave two possible reasons for the wide range. First, the outside contractors hired by the EPA to study industrial waste streams sometimes had little or no knowledge of the nature of those industries. Second, a lack of coordination within EPA between the effluent guidelines division and other groups familiar with industrial pollution control prevented the cross-checking of research results to uncover the variations before the standards were publicly discussed.

Patterson also found alarming differences between the limits proposed for indirect dischargers within the same category. After taking into account the removals that could be expected at the municipal treatment plant, he calculated a 20-fold difference for limits on antimony and nickel, a 9-fold difference for zinc, a 28-fold difference for lead, and a 100-fold difference for chromium and copper in the inorganic chemical industry. Patterson concluded that the variations created economic disparity between inorganic chemical manufacturers discharging the same pollutants to a treatment system.

Still examining the question of parity among indirect industries, Patterson compared the pretreatment standards proposed with the treatment capabilities of a well-run industrial facility's pretreatment system. That comparison revealed that the range of proposed limits bracketed the removals possible. Total chromium, copper, and nickel, for example, had limits that were 10 to 25 times lower than the concentrations that could be removed. Other substances such as arsenic had limits that were 10 times higher than could be removed. Such a wide spectrum of proposed limits would require some industries to install sophisticated equipment to extract painfully small amounts of one substance while allowing extraordinarily large amounts of other substances to pass through.

Finally, Patterson wondered about parity between direct and indirect dischargers. He compared the equivalence of proposed pretreatment limits with alternative direct discharge limits for equivalence of proposed pretreatment limits for seven industries. In four cases, the proposed pretreatment limits were equivalent to the BAT limits. In one case, they were comparable to "best practicable technology" (BPT) limits (a lower set of figures than BAT numbers). In two cases they were not equivalent to either BAT or BPT restrictions.

What did Patterson's quartet of studies prove? The first point they drive home is that parity is an impractical concept on which to base standard-setting. In the past, long legal battles have surrounded the release of each proposed pretreatment standard. Holding to the notion of parity invites court suit on the grounds of disparity. A second point is that insisting on parity will, in many cases, mean requiring some industries to install pretreatment equipment solely for pretreatment's sake. Achieving parity becomes more important in those cases than protecting the municipal plant, its sludge, or the receiving stream. Indeed, the lengths to which one might go to reach parity sometimes pass the point of no return, as illustrated in an analysis by James North of Resource Consultants, Inc.

Recommendation: recognize the differences between direct and indirect industrial dischargers. Eliminate the parity principle from the standard-setting process. Concentrate on building data bases that are needed to support reasonable BAT standards for direct dischargers. Direct industrial dischargers and municipal treatment plants could then meet comparable effluent limits. With a firm set of effluent limits, municipal authorities can develop pretreatment limits to protect their facilities and receiving waters.

Objective—make pretreatment requirements similar for old and new dischargers

Section 307 of the act requires the EPA administrator to publish new pretreatment limits each time new source direct discharge limits are set under Section 306. Program officials at EPA can interpret this to mean that new source pretreatment standards will naturally be more restrictive than those that were set for existing sources. Nothing in the law or the legislative history of the act supports this interpretation as the only possible one. Indeed, a pretreatment standard may be modified on any one of three grounds: limitations of technology, economic burden, or limitations on space available for new pretreatment equipment at the plant site. The underlying intent of revising Section 307 in 1977 was to help the agency improve its response time when certain substances were shown to be toxic, yet were not covered by either a performance standard under Section 306 or a pretreatment standard under Section 307. Revisions to both sections were also intended to make it easier for EPA to raise direct and indirect effluent limits, *if justified by actual findings.*

Problems endemic to the national pretreatment program arise from the agency's inability to commit enough time and energy to the BAT stand-

ard-setting process before deadlines run out. More effort must be devoted to setting standards for existing sources. Concentrating on existing sources and the limits they will need to adopt contributes to the pace of local pretreatment program development. The requirements of Section 307(c) can be satisfied by initially promulgating the same pretreatment limits for new sources as for old sources.

Recommendation: A single pretreatment standard for each pollutant in each industry category should be set under the national program. No distinction should be drawn between limits on the same pollutant for new and old sources.

Objective—eliminate the concept of "indicator" pollutants

EPA pretreatment program developers have shown a fair amount of flexibility in their efforts to find effective ways to set limits with inadequate information on many of the priority pollutants. One line of reasoning pursued was the idea that certain well-known pollutants (such as suspended solids) could be used as "surrogates" for pretreatable substances. However, the creation of a surrogate depends on amassing enough removal data to establish a statistical relationship between the surrogate and the substance to be controlled. In most cases, surrogates could not be developed. Thus the concept of "indicators" was advanced. Indicators would be substances for which reliable information existed and for which a causal relationship between their removal and the removal of pretreatable pollutants (for which little reliable information existed) was presumed to exist. In short, the indicator concept acknowledged the lack of a firm statistical link but asserted a reasonable judgment that removing the indicator also removed the controlled substance.

Attempts to apply the indicator concept to priority pollutants have focused primarily on organic substances. But the agency has run into serious problems in validating the notion. The main difficulty is that EPA has a much smaller data base for organic toxicants than it does for the more common substances such as heavy metals (copper, chromium, nickel, and zinc) that could serve as the indicators. We do not know enough at this time to link lesser-known pollutants with the more familiar ones—statistically or otherwise. The correlations cannot be drawn and the removal relationship cannot be inferred.

Agency investigators at the 1980 WPCF symposium cautioned against expecting widespread adoption of the indicator concept as a way to speed up the writing of pretreatment limits. At the same conference, Wesley Eckenfelder of Vanderbilt University suggested that EPA concentrate on building better data bases for the lesser known pollutants by concentrating on questions about their actual fate in a municipal treatment plant, their reaction rates when mixed with domestic wastewater flows, and their potential to cause bulking problems in the treatment process.

Recommendation: while an excellent example of how to keep an open mind in the standards-setting process, the indicator pollutant concept should not be pursued any further as a way to develop pretreatment standards. The EPA investigation effort must be directed towards learning more about the actual fate of the pollutants being controlled.

Objective—eliminate the removal credit system

A second idea that gives more flexibility to the pretreatment program is the granting of "removal credits" to the industrial customers of a municipal system where it can be proven that the municipal plant consistently removes significant amounts of regulated pollutants. For example, if the pretreatment standard for copper was 4 mg/l and a municipal authority could show consistent removals of 1 mg/l for copper, industrial contributors to that system would be allowed to discharge up to 5 mg/l of copper in their wastes. Industrial groups following the development of the national pretreatment program strongly favor the removal credit concept. Municipal groups agree that it has merit and can work, but they do not believe the removal credit regulations proposed thus far are practical.

Legal action against EPA by the Chemical Manufacturers Association on this issue led to reproposing the general pretreatment regulations in October 1979. While trying to work out a removal credit arrangement that would work for industries and still meet the objectives of the pretreatment program, EPA negotiators made it very difficult for a municipal authority to actually calculate credits. Most have decided it simply isn't worth the trouble.

There are alternatives to the credit system. Congress should authorize treatment authorities to run their own pretreatment programs independently of the national categorical standards for direct dischargers. This would give municipal treatment authorities full control over the actual design of their programs. They could set their own standards, develop their own system, and eliminate the question of parity as long as their programs meet the discharge requirements of their National Pollutant Discharge Elimination System (NPDES) permit. A pretreatment program of this type would also let local authorities focus on the highest concentrations of toxic substances first, thereby setting their priorities according to local conditions rather than administrative convenience at the national level. This approach leads to the issue of making pretreatment work on the "front line."

Recommendation: Congress should amend the law to require treatment authorities to design their own own programs. EPA would still be responsible for setting effluent limits for end-of-pipe discharges from POTWs.

Objective—encourage state and local authorities to develop strong programs

The objectives and recommendations examined so far are primarily aimed at making it possible for EPA to develop a more reasonable toxic pollutant control program nationally. One of those improvements involves giving treatment authorities full control over the design and execution of their program. Selectively choosing other facets of the general program that state and local participants could assume more responsibility for would also speed up its implementation.

Overall, the concept of pretreatment is sound. The pretreatment regulations should be a good framework for toxic pollutant control in municipal systems that mesh with the NPDES compliance system. However, state and local governments simply do not have the time, people, or money necessary to install a full-blown pretreatment program immediately. At House oversight hearings in the summer of 1980, one state official reported that ". . . the State's request to EPA for pretreatment program authorization projects the need for a staff of 124 for the work for (the state agency) alone, with no mention of the needs at the local levels. In reality, because of Federal and State funding constraints, we can eventually expect a total State staff of a maximum of only 31 people."

The ability of state and local governments to move swiftly once national program requirements are developed has been crippled by the continuing doubt that EPA will be able to meet any of its own deadlines. Accepting the recommendations made in this paper could lead to faster progress nationally, but the agency should not insist that state and local authorities try to do in a few years what is taking the federal government a decade to accomplish. The stumbling block in the critical path of the national program has been our ignorance about most of the toxic substances. But different obstacles confront the other governments.

At the state and local levels, the problem is mainly one of time and energy. Both of these factors depend on the budget available to implement a program. That budget is not a function of the program's complexity, but of how important pretreatment is within the state, compared to all other environmental priorities. As the originators of the national program, EPA officials are rightly concerned about developing regulations and guidance for controlling *all* of the substances on the priority list. At the lower levels, however, it doesn't make sense to be equally concerned about all possible toxic pollutants that may enter the streams. A more effective use of available resources would be to first control those substances that are already known to be a problem. States and local authorities can fulfill the basic objectives of the program by identifying and controlling all indirect dischargers who are contributing to municipal treatment plant interference. To its credit, EPA has been willing to honor this type of arrangement.

Recommendation: EPA should interpret pretreatment program regulations to permit state and local authorities to phase in their programs, starting with pollutants and industrial contributors that are known to upset plant operations. Additional control for eliminating pass-through problems and for tracking the fate of lesser-known substances may be developed later.

"Industrial Pretreatment Needs To Be Overhauled At The National Level" is the fourth in a series of WPCF position papers. It was developed by a task group consisting of Jack Washburn (chairman), Ken Kirk, Gerald McDermott, and Robert O'Dette.

This is a reprint from the *Journal Water Pollution Control Federation*, the monthly technical journal published by the Water Pollution Control Federation.

The Water Pollution Control Federation (WPCF), a non-profit educational membership organization, was founded in 1928. Pledged to provide leadership and guidance in the control of water pollution, the Federation acts as a source of education and information to the public as well as to individuals in the field of water pollution control. As such, it does not lobby or accept federal funding.

WPCF is composed of 40 member associations in the U.S. and is affiliated with 25 other organizations around the world. More than 30 000 people belong to the Federation. Our members include engineers, biologists, chemists, academia, federal, state, and local government officials, wastewater treatment plant operators, consultants, equipment manufacturers, contractors, industrial representatives, students, and others interested in clean water.

The U.S. and foreign associations are autonomous groups represented on the WPCF Board of Control, the policy-making body of the Federation. This bonding of individually strong groups under one banner is why the Federation has long been the leading technical organization in the water pollution control field.

WATER POLLUTION CONTROL FEDERATION
2626 Pennsylvania Avenue, N.W.
Washington, DC 20037
(202) 337-2500

Mr. STANGELAND. I would appreciate it if you could flesh that out for our benefit. Thank you.

Mr. ROE. Are there any other questions?

The gentlelady from New York.

Ms. FERRARO. Thank you, Mr. Chairman. I would just like to follow up a little bit on the municipal construction grant.

On page two of your testimony you make some suggestions that Congress take the following steps. You set out three steps.

Could you give us a little more detail on that? What would the completion schedule be? How long would it take? How much per year in Federal grants?

Mr. FREEZE. We, in putting together a position paper for the federation, suggested a 10 year phase-out of the program. There are several reasons for that.

One is that we believe there must be a certain amount of money available for the program that people can depend on.

We believe if there were a set period of time—we suggested 10 years, over which people could know how much money they could count on—they could plan and set their projects up on that basis. That would be a much more realistic effort than hoping for $5 billion this year and nothing next year.

So we have suggested 10 years. We are not locked into that position, but that is what our paper says. We have always endorsed the concept of self-supporting plants.

We believe in the long run, as we say in point three. We believe this is a one-time-only program.

It was intended, as I understand the bill, it was intended to be that type of financing, a shot in the arm to get our industry on its feet.

But it never was anticipated to my knowledge that that would be continuing forever, but we would have to go back to the tried and true fundamental way of funding municipal projects through water and sewerage usage charges or something similar to that.

Something on a local financing basis. In our position paper that is what we have emphasized.

Ms. FERRARO. You have mentioned the position paper twice. Could you share that position paper with the committee so we would have your full thoughts on the matter?

Mr. FREESE. We would be pleased to.

[The information received follows:]

Washington, D.C., August 23, 1983.

Hon. GERALDINE FERRARO,
Cannon House Office Building,
Washington, D.C.

DEAR REPRESENTATIVE FERRARO: On Tuesday, August 2d during hearings before the water resources subcommittee, you asked two questions of Mr. Paul V. Freese, a witness for the Water Pollution Control Federation. Mr. Robert A. Canham, our executive director, has asked me to respond.

Your first question pertained to the WPCF documents supporting Mr. Freese's formal statement. We are sending enough sets of the reference documents to the majority and minority staffs for each member of the subcommittee to receive one.

Your second question pertained to the Federation's position on completing the construction grants program.

When the 1972 act was passed, leaders within WPCF recognized that federal support for publicly owned treatment works (or POTWs) would be needed. There was no

other way to meet the 1977 and 1983 water quality goals Congress had set. Our members applauded provisions in Titles I and II that required construction grant recipients to plan their financial affairs so that the federal government would not have to continue subsidizing the POTWs once the goals were fulfilled.

Since that time, the construction grants program has directed over $30 billion into improving municipal treatment systems around the country. Many of the facilities are not yet completed, because the process of designing and constructing such systems takes many years. Once in operation, those facilities will do a great deal to restore and maintain our nation's water quality.

In 1972, Congress was primarily concerned with improving treatment capacity on a massive scale. Now, a decade later, we believe that congressional leaders should be primarily concerned with guaranteeing that the facilities constructed will operate properly. WPCF members believe the change in focus is appropriate, given the progress that we have made in the grants program. We strongly believe that now is the time for Congress to reaffirm its original intention that POTWs become self-supporting public utilities. Thus the statement enclosed deals extensively with that issue.

At this point, let me define the term "self-supporting" as we use it in our paper. "Self-supporting" means that communities can meet their treatment requirements without additional assistance from the federal program. Our definition of the term does not preclude a State from deciding that it wants to assist POTWs through a grant or loan program. It simply means that when a community meets the federally required goals, it is no longer eligible for federal assistance.

In 1980, we began to receive reports from our members and from grant managers at U.S. EPA that some communities were applying for a second round of grant assistance. These were communities that had already built facilities required by the law and were now coming back for more money to expand or improve those facilities. This disturbed us greatly.

At the same time, the Public Works subcommittee on investigations and oversight began hearings on the results of the grants program. Subcommittee investigators uncovered instances of grant-funded facilities that were inadequately staffed and operated. The General Accounting Office supplied similar reports of its own. From this, WPCF concluded that the goal of self-supporting utilities had to be re-emphasized, or the reason for creating the grants program would be lost.

In 1981, the Federation published its first statement on the grants program, urging that it be completed. The position was controversial, even within our own membership. It remains so today. In fact, our 1982 sequel was the results of a question about that statement from this subcommittee. In our supplement we recognized the contributions of the 1981 amendments to the program and suggested a 10-year completion schedule for it. The schedule included a minimum of $19.6 billion from the federal government. We also encouraged consideration of a federally-supported trust fund as the vehicle for channeling money into construction during the latter half of the completion period.

To my knowledge, the Water Pollution Control Federation is the only organization that advocates completing the program. And I am sure that the Federation is the only one that has suggested a specified timetable and budget for the program. We hope that our position will lead other interested groups to address the same question.

In closing, let me say that WPCF is very sensitive to the practical implications of making POTWs financially independent. It will mean that customers will pay more for wastewater treatment. And traditionally, sudden increases in wastewater charges make voters critical of their local officials. Few politicians would support such an unpopular decision if they doubted the public was behind them. Consequently, those of us in the "clean water community" need to capitalize on the strong public support that several witnesses at the hearings mentioned.

It will take many years of public education to make people appreciate the value of wastewater treatment. Is the environmental consciousness that Lou Harris reports strong enough to ease the jolt many customers will feel when their rates go up? We believe it is, if nurtured through public education. And the first step in that educational process is making people aware of the benefits they receive through the grants programs . . . benefits that can only be retained through financial independence.

Thank you for the opportunity to explain our position. Should you or your staff wish to discuss the grants program further, please contact me. My telephone number is 337-2500, extension 33.

Sincerely yours,

ANDREW E. STEVENSON, *Director of Public Affairs.*

Ms. FERRARO. At the risk of appearing to be in a bit of a rush, on the nonpoint source programs, you at the bottom of page 3 indicate that you would not take any more of the committee's time to present tentative conclusions of the impacts on other beneficial uses of—et cetera.

Could you briefly discuss those other matters with us?

Mr. FREESE. We could briefly discuss it or supply, again, a position paper we have prepared on nonpoint sources, on rural nonpoint sources. The paper is specifically on rural NPS.

It does not address the urban problem which you have raised. What we have seen are—as I believe was mentioned again this morning—studies by a number of different agencies. The Farm Bureau has been involved. Soil Conservation Service has been involved. We have been involved.

That information has not been brought together, shared and put into a results oriented paper. We believe before any action is taken that the information that is available needs to be analyzed and understood.

That was the point of our comment here. On the urban runoff, which you asked about earlier, we made some note that half of the substances on EPA's priority pollutant list sometimes occur in urban runoff.

Heavy metals we mentioned, copper, lead, zinc, appear more frequently than the organics do. But they are there, also.

High concentrations of heavy metals are found frequently enough in urban runoff to perhaps pose a chronic risk in some cases.

So we believe the problem is there. We just don't believe that the results of the research have been completed and understood at this point.

Ms. FERRARO. Thank you. I would appreciate it if you would supply a position paper on this point as well.

[See Journal—Water Pollution Control Federation, page 333.]

Mr. ROE. We want to thank you very much for your presentation. Again, don't think the brevity is lack of interest. It is not. We will be calling you back further.

I know you are going to be monitoring as the hearings are held and we will look for further input as we go along.

We want to thank you very much for being with us this morning.

Mr. FREESE. Thank you very much.

Mr. STANGELAND. If I might point out, Mr. Chairman, I think I have tallied up over 800 hours on the bill we are presently moving through committee, so they can rest assured brevity is not going to be the order of the day on this piece of legislation, either.

Mr. ROE. Very good.

Our next witness is representing the National Association of Manufacturers, Mr. Harold Jensen, director of energy, conservation and environmental control, Warner Lambert Co., Morris Plains, N.J. and chairman, NAM water task force.

Mr. Jensen, welcome to our committee. If you would be kind enough, your testimony will be inserted in the record in full. If you would summarize, we would appreciate it.

[Statement referred to follows:]

TESTIMONY ON BEHALF OF THE NATIONAL ASSOCIATION OF MANUFACTURERS, PRESENTED BY HAROLD JENSEN, DIRECTOR OF ENERGY CONSERVATION AND ENVIRONMENTAL CONTROL, WARNER-LAMBERT CO.

I am Harold Jensen, Director of Energy Conservation and Environmental Control for Warner-Lambert Company and Chairman of the National Association of Manufacturers' Environmental Quality Committee.

The National Association of Manufacturers is a voluntary association of more than 13,000 enterprises engaged in manufacturing in the United States. The greater bulk of its members discharge water into navigable streams either directly or through Publicly Owned Treatment Works (POTWs). Therefore, they are greatly impacted by the provisions of the Federal Water Pollution Control Act, referred to as the Clean Water Act. Therefore, we deeply appreciate the opportunity to present our views on needed amendments to the Clean Water Act before the Subcommittee on Water Resources.

We understand that at this initial one-day hearing, the Subcommittee is interested in an overview by major interest groups of the issues involved in reauthorization of the Act. Consequently, we will limit our testimony to a brief listing of what we believe are the most important issues. We understand that the subcommittee will hold further hearings in September, at which time we would like to have the opportunity to elaborate on these points.

On July 20, 1983, the NAM sponsored a National Conference on Clean Water Act Reauthorization held in Washington, DC. The issue which was the subject of most discussion was that of pretreatment. The present National Categorical Pretreatment System has created a vast amount of confusion among dischargers and among owners and operators of Publicly Owned Treatment Works. This rigid and inflexible system does not take cognizance of variations in individual plant discharge streams and variations in the capacities of POTWs to handle the particular wastewater streams involved. These interrelated factors are site specific and cannot be properly considered under any national uniform industrial program. Representatives of various industries, representatives of agencies operating POTWs, and representatives of state regulatory authorities all agreed on this matter at the National Conference on Clean Water Act Reauthorization. Thus, there is widespread support among all interested parties for alternative local pretreatment systems. Consequently we strongly urge that the Subcommittee approve an amendment which would allow the establishment of alternative local pretreatment systems.

I will briefly touch upon other issues of great importance to industry. The first is the fact that present law specifies a deadline date of July 1, 1984 for effluent limitations based on Best Available Technology. Some of these effluent limitations have not yet been promulgated, some have been promulgated only recently, and some are being litigated. It would be either impossible or extremely costly at best to meet this deadline date. The Act should be amended to allow at least three years from the date of promulgation of the effluent limitations for each particular industry's category or subcategory. There should be no fixed deadline date specified in the law since experience has shown that specific deadline dates have become meaningless in actual practice.

Another disturbing aspect of the implementation of the Clean Water Act relates to the fact that there is a backlog of some 70 percent of applications filed for reissuance of National Pollutant Discharge Elimination System permits usually referred to as NPDES permits. From a realistic point of view, there is no point to limiting NPDES permits to a term of 5 years. Many different interest groups believe that the resources of both EPA and dischargers could be conserved without sacrificing the objectives of the Act by extending the term of NPDES permits from 5 years to 10 years.

We also urge that effective steps be taken to control water pollution from nonpoint sources. Industry has spent billions of dollars over the last dozen years in installing, operating, and maintaining water pollution control facilities. The result has been very substantial improvement in water quality in many areas. In other areas, the remaining problems are frequently due to municipal dischargers or discharges from nonpoint sources. It is not rational to continually ratchet down on industry when the results will be little perceptible improvement in water quality and the problems still remain. In many instances, manufacturing plants return water of better quality to the receiving stream than the water originally withdrawn. We note that the Small Watershed Program administered by the Soil Conservation Service of the Department of Agriculture has helped to minimize the problems of erosion and siltation in many areas. Perhaps this program could form a foundation for an expanded comprehensive program to control water pollution from nonpoint sources

both in rural and urban areas. We strongly urge that the Subcommittee provide for such a program.

The evidence indicated that the installation of Best Practicable Control Technology (BPT) by industry has served to control many pollutants which have been classified as "toxic". Therefore, we urge that the Act be amended to provide that the Best Available Technology be required only in the case of truly significant toxic problems.

Another matter of concern to manufacturing companies is the fact that a number of designated water uses in various parts of the country are impossible of attainment. We urge that the states be allowed flexibility to adjust water quality standards and uses to meet realistic conditions and needs of each particular state.

We greatly appreciate the opportunity to present our views.

TESTIMONY OF HAROLD JENSEN, DIRECTOR OF ENERGY, CONSERVATION AND ENVIRONMENTAL CONTROL, WARNER LAMBERT CO., REPRESENTING THE NATIONAL ASSOCIATION OF MANUFACTURERS

Mr. JENSEN. Good afternoon, and thank you.

I anticipated that this would be a brief overview, as openings. Therefore, we hit upon a few key issues. Like other witnesses, we would be glad to come back and get into more depth at some time, if you wish.

As chairman of the water task force of National Association of Manufacturers, I know you are aware that we are representing some 13,000 enterprises involved in uses of our waters and greatly impact it.

I would just like to call to your attention that 2 weeks ago, July 20, NAM sponsored a national conference on Clean Water Act reauthorization held here in Washington, D.C. The subject that received the most discussion was that of pretreatment. It was brought out that the national categorical pretreatment system has created a vast amount of confusion among dischargers and among owners and operators of publicly owned treatment works.

This rigid and inflexible system does not take cognizance of variations in individual plant discharge streams and variations in the capacities of POTW's to handle the particular wastewater streams involved. We came to the conclusion from this conference that the national uniform industrial program is not workable.

Representatives of various industries, representatives of agencies operating POTW's, and representatives of State regulatory authorities all agreed on this matter at the national conference on Clean Water Act reauthorization. Thus, there is widespread support among all interested parties for alternative local pretreatment systems. Consequently, we strongly urge that the subcommittee approve an amendment which would allow the establishment of alternative local pretreatment systems.

Other issues we feel that are of importance, and these are not listed necessarily in order of priority, we would like to look at extension of effluent limits from the 1984 date. As you know, some of these regulations have not yet been implemented, some of them have. Some of them are under litigation. So we strongly urge we have the 3-year extension spoken of before.

One thing we are concerned about is that there should not be a fixed deadline for the completion because we have learned in the past history of the Clean Water Act that in actual practice, fixed deadlines do cause problems.

With respect to the NPDES permit life, most we think would agree that the resources of both EPA and dischargers could be conserved without sacrificing the objectives of the act by extending the term of NPDES permits from 5 years to 10 years.

Nonpoint sources have been discussed today and we definitely feel this should be an issue in the discussion of the amendments to the act. Industry feels they have done a fairly good job in treating their wastewaters and would hate to be the—having more implementation placed upon us, ratcheting us down only to find that the nonpoint sources were contributing large quantities of the pollutants, then find the problem is not completely solved.

Another area that has been discussed, the toxics. The evidence indicates that the installation of best practicable control technology (BPT) by industry has served to control many pollutants which have been classified as toxic. Therefore, we urge that the act be amended to provide that the best available technology be required only in the case of truly significant toxic problems.

The last issue is water quality standards. We feel designated water uses be more flexible and in the State area to relate to the fact that local conditions do prevail and many times the natural conditions are the ones that are causing the water not to meet the water quality standards.

Well, I appreciate the opportunity to testify. We would be glad to offer further information or answer any questions you may have.

Mr. ROE. Are there any specific questions?

We will be calling you back, as you know. Are there specific other questions of Mr. Jensen at this point? We want to thank you for your presentation. I think what you have done is highlight the concerns of the National Association of Manufacturers. We will be calling you back.

Our next witness is Mr. William West, director of environmental control, Republic Steel Corp., and chairman of the AISI committee on environment. We want to welcome you to the committee.

Mr. West, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF WILLIAM L. WEST, DIRECTOR OF ENVIRONMENTAL CONTROL, REPUBLIC STEEL CORP. ON BEHALF OF THE AMERICAN IRON AND STEEL INSTITUTE

Mr. Chairman, Members of the Subcommittee, I am William L. West, Director of Environmental Control for Republic Steel Corporation. I am appearing here today on behalf of the American Iron and Steel Institute, a trade association which includes 62 domestic corporations representing about 88 percent of the steel production capacity in the Untied States. I am Chairman of the Institute's Committee on Environment.

I would like to present the viewpoints of the American Iron and Steel Institute on amending the Clean Water Act. Before discussing amendments to the Act, I would like to provide a little background on the steel industry. The steel industry has in the past and continues to support the environemtnal objectives established by the Congress. Our industry is committed to carry out responsibily our share of the nation's water pollution control program. The steel industry has already invested over $2 billion in facilities for the control of water pollution. We have in place and operating today facilities to control over 95 percent of all water pollutants generated in our plants. Under the new effluent limitations guidelines established for our industry last year, we will be installing within the next few years additional facilities to achieve about 99 percent control of conventional and nonconventional and toxic pollutants generated within our plants. I think our record in the area of water pollu-

tion control is one of which we can and should be proud. We recognize that we have a responsibility to improve upon our accomplishments to date.

This nation and the steel industry are faced with an unprecedented economic situation. The nation is just recovering from the worst economic climate since the Great Depression on the 1930's The steel industry, the nation's most basic industry, was one of the hardest hit in this recession. In 1982, our industry operated at well under 50 percent of its capacity. The industry's employment level in 1982 reached its lowest since the days of the Great Depression. While there real signs of recovery today, the industry is not yet profitable. It is widely recognized that we must make major capital investments in modernizing and improving our facilities if we are to retain our position as a world leader in steel production. We believe that modernization and growth of our industry are fully compatible with rational environmental policies. We would empahsize that new, modern facilites are inherently cleaner and less polluting than other, existing plants. We believe that at this stage in the evolution of the nation's water pollution programs some amendments to the Clean Water Act and some changes in regulatory approaches are essential to permit prudent use of our environmental spending, so that we can have a balanced program of economic growth and environmental progress.

Turning now to the Clean Water Act, I testified before this Subcommittee a little over a year ago and pointed out the industry's urgent need for extending the deadlines under the Clean Water Act. The passage of a year has magnified the necessity for extending the compliance date of July 1, 1984, the present deadline in the Act for technology requirements. That deadline was based on the premise that effluent limitations guidelines were to have been established by mid-1980. That schedule would have provided for industry a 48-month period from establishment of the guidelines to completion of facilities. I would point out that establishment of effluent limitations guidelines is only the first step toward final compliance. The second step is incorporation of these guidelines into NPDES permits establishing the requirements for specific plants. This, in itself, is a complex, time-consuming step. It is not a simple, cookbook procedure; analysis and evaluation of the uniqueness of the individual plant and site specific problems can be addresssed only by the permit writer working closely with the plant operator. The complexity of the permitting process is illustrated by the fact that the U.S. Environmental Protection Agency or the states, where delegation is in effect, are jsut now beginning to issue NPDES permits to the steel industry. Most steel plants have not yet been issued permits even though the applicable effluent limitations guidelines were issued over a year ago. The time for compliance has thus been reduced to less than a year.

Only when the permitting process is complete can the discharger have all of the necessary information to begin process selection and design and construction of a treatment facility. Based on extensive [illegible] industry experience, we can say that the lead time from the establishment [illegible] permit requirements to routine operation of complex control systems, the ty[illegible] for final treatment in the steel industry, is a period of about 36–42 months.

Therefore, we believe it essential that the Clean Water Act be amended to extend the deadlines for all technology-based requirements by a period of 42 months after the date of enactment or 36 months after the imposition of specific limits for industrial operations, whichever is later. This extension should apply to all newly imposed technology-based requirements, including those under Section 301(b)(2) of the Act and those under Section 301(b)(1)(A)(1), that is, any modified or redefined BPT which will in most cases be achieved concurrently with the requirements for attainment of limitations set under Section 301(b)(2). We encourage this Subcommittee to initiate amendments to effect such changes.

Another section of the Clean Water Act that we believe should be amended deals with programs for pretreatment of industrial wastewaters. We believe it quite appropriate that the pretreatment portions of the law be reexamined and amended significantly to provide a more workable, practical system of pretreatment permitting. In 1977, the Congress amended the Clean Water Act specifically to provide for the granting of removal credits by a publicly owned treatment works (POTW). EPA's implementation of the removal credit program has resulted in regulations that are so complex and administratively difficult that they tend to discourage rather than encourage cost-effective joint treatment of industrial and municipal wastes. Several large operators of POTWs, the very people who are required to administer the program, have stated that the removal credit regulations are unworkable. In addition, a report by the House of Representatives Subcommittee on Oversight and Review of the Committee on Public Works and Transportation in the 96th Congress also concluded that removal credit provisions are unworkable. To resolve the problem, AISI recommends legislation to establish a process which would enable

local agencies having effective local programs to implement them without continued reliance on national categorical programs. Local agencies would be required to have in place, or be on a schedule to have in place before the compliance date for a categorical pretreatment standard, a pretreatment program that meets national pretreatment objectives and demonstrates the legal, administrative and technical capability to require industrial compliance with locally set requirements acceptable to the states and EPA. The local standards would be derived on a site-specific basis to protect water quality and sludge quality as well as plant operations.

Another serious problem to industry is encountered where diverse manufacturing operations discharge to the same wastewater collection system, requiring the application of two or more of the 21 major industrial pretreatment effluent limitations guidelines. Industry is required to meet pretreatment guidelines no later than three years after promulgation. Many of these guidelines, however, are yet to be promulgated. The net result is that individual plants are faced with the impossible situation of having to comply with at least two different compliance dates. This has been identified as "the moving target" problem. We believe that a better solution is to require a facility to meet its specific pretreatment standards three years after promulgation of the last set of regulations applicable to each specific facility.

In addition to these two areas where we believe that significant amendments to the Clean Water Act should be made, there has been considerable discussion of the need for amendments in other areas, particularly those of water quality standards and toxic pollution of streams. Relative to water quality standards, there has been a great deal of discussion of preventing the downgrading of waterways and maintaining existing designated uses. The steel industry, let me assure you, does not favor increased pollution levels in streams. We do not favor changing properly designated uses of various streams or allowing increased pollution which would prevent a stream from maintaining its presently achieved uses. On the other hand, we know that some present water quality standards were improperly set to provide for protection of fish, shellfish, and wildlife and recreation in and on the water, without adequate analysis as to whether these uses were attainable.

Some of the current designated uses do not represent proper uses now attained or even potentially attainable, but are the result of hasty and sometimes improper rulemaking. To perpetuate these mistakes of the past by legislative decree would not be to the advantage of the country or in keeping with the true objectives of the Clean Water Act. We believe that the present Clean Water Act provisions with respect to water quality standards are adequate.

Another aspect of water quality is a proposal for automatic upgrading of water quality criteria wherever water quality is shown to exceed current standards. We believe such a proposal contains serious potential for improper and damaging upgrading. For example, if stream surveys were conducted during periods of subnormal industrial operations and indicated a clean stream segment, that segment would have to be upgraded to equal the current quality level. Once operations return to normal levels, additional controls might be required simply to achieve the water quality encountered under periods of reduced operations. Such provisions would, in effect, represent a continuing "ratcheting down" of the criteria and result in a regulatory merry-go-round of revising the standards, installing additional treatment, and then repeating the process again. Clearly, this is not and should not be the intent of the Clean Water Act.

Furthermore, any time installation of additional facilities results in improved water quality, streams might have to be upgraded to conform to the newly encountered stream quality, even though there is no social or economic reason for such upgrading. Thus, automatic upgrading would severely limit any possibility of future expansion or growth since there would never be under such a proposal sufficient allocation of water quality to allow future waste flows.

It has also been suggested that the Act be amended to take care of "toxic hotspots;" that is, areas which will not meet fishable/swimmable water quality standards, even after implementation of best available technology and adequate pretreatment and municipal waste treatment. We believe that Section 302 of the present Act, which establishes a proper mechanism for establishment of water quality related effluent limitations beyond best available technology, is quite adequate to permit elimination of such "toxic hotspots" if they exist, and that no amendment to the Act is required to implement further controls of this type. The Institute believes that the present provisions of the Clean Water Act with respect to water quality standards adequately serve the purposes of the Act.

To summarize our position very briefly, we believe that the Clean Water Act should be amended quickly to extend the deadlines for achievement of technology-based requirements by industrial dischargers, and that the pretreatment provisions

should be modified to provide greater flexibility to encourage cost-effective joint treatment of industrial and municipal wastes. We do not believe that any changes to the water quality standards or toxic pollutants sections of the Act are required.

We thank you very much for this opportunity to appear before you today to express our opinions on amendments to the Clean Water Act. We will be happy to provide the Subcommittee any further information you require and to provide assistance in drafting effective amendments to the Clean Water Act.

Mr. ROE. Please proceed.

TESTIMONY OF WILLIAM L. WEST, DIRECTOR OF ENVIRONMENTAL CONTROL, REPUBLIC STEEL CORP., AND CHAIRMAN, AISI COMMITTEE ON ENVIRONMENT

Mr. WEST. I will do so.

Mr. Chairman, members of the subcommittee, I am William L. West, director of environmental control for Republic Steel Corp. I am appearing here today on behalf of the American Iron and Steel Institute, a trade association which includes 62 domestic corporations representing about 88 percent of the steel production capacity in the United States. I am chairman of the institute's committee on environment.

I would like to present the viewpoints of the American Iron and Steel Institute on amending the Clean Water Act. I testified before this subcommittee a little over a year ago and pointed out the industry's urgent need for extending the deadlines under the Act. The passage of a year has magnified the necessity for extending the compliance date of July 1, 1984, the present deadline in the act for technology requirements.

Most steel plants have not yet been issued permits that describe those requirements even though the applicable effluent limitation guidelines were issued over a year ago. The time for compliance has thus been reduced to less than a year. Therefore, we believe it essential that the Clean Water Act be amended to extend the deadlines for all technology based requirements by a period of 42 months after date of enactment, or 36 months after imposition of specific limits for industrial operations, whichever is later.

This extension should apply to all newly imposed technology requirements, including those under 301(b)(2) of the act and those under 301 (b)(1) (a)(1), any modified or redefined BPT will in most cases be achieved concurrently with the requirements for attainment of limitations set under section 301(b)(2), the BPT. We encourage the subcommittee to initiate amendments to effect such changes.

Another section of the Clean Water Act we believe should be amended deals with programs for pretreatment of industrial wastewater. We believe it quite appropriate that pretreatment portions of the law be reexamined and amended significantly to provide a more workable practical system of pretreatment permitting.

EPA's implementation of the removal credit program has resulted in regulations that are so complex and administratively difficult that they tend to discourage rather than encourage cost effective joint treatment of industrial and municipal waste.

To resolve the problem, AISI recommends legislation to establish a process which would enable local agencies having effective local programs to implement them without continued reliance on nation-

al categorical programs. Local agencies would be required to have in place or be on schedule to have in place before the compliance date for a categorical pretreatment standard a pretreatment program that meets national pretreatment objectives and demonstrates the legal, administrative and technical capability to require industrial compliance with locally set requirements acceptable to the States and EPA.

Another serious problem to industry is encountered through pretreatment where diverse manufacturing operation discharge to the same wastewater collection system requiring the application of two or more of the 21 major industrial pretreatment effluent limitations guideline. This has been identified as the moving target problem. We believe a better solution is to require a facility to meet its specific pretreatment requirements 3 years after promulgation of the last set of regulations applicable to each specific facility.

In addition to these two areas, we believe significant amendments to the Clean Water Act should be made, there has been considerable discussion of the need for amending in other areas, particularly those of water quality standards and toxic pollution of streams.

Some of the current designated uses do not represent proper uses now attained or even potentially attainable, but are the result of hasty and sometimes improper rulemaking. To perpetuate these mistakes of the past by legislative decree would not be to the advantage of the country. We believe the present Clean Water Act provisions with respect to water quality standards are adequate.

Another aspect of water quality is a proposal for automatic upgrading of water quality criteria whenever water quality is shown to exceed current standards. Automatic upgrading would severely limit any possibility of future expansion or growth since there would never be under such a proposal sufficient allocation of water quality to allow future waste flows.

It has been suggested also that the act be amended to take care of toxic hot spots, that is, areas will not meet fishable, swimable water quality standards even after implementation of best available technology and adequate pretreatment and municipal waste treatment. We believe section 302 of the present act, which establishes the proper mechanism for establishment of water quality related effluent limitations beyond best available technology, is quite adequate to permit elimination of such toxic hot spots.

To summarize our position very briefly, we believe the Clean Water Act should be amended quickly to extend the deadlines for achievement of technology based requirements by industrial dischargers and that the pretreatment provisions should be modified to provide greater flexibility to encourage cost effective joint treatment of industrial and municipal waste.

We don't believe any changes to the water quality standards or toxic pollutants sections of the act are required.

Mr. Chairman and members, I thank you for the opportunity to appear before you today and express our opinions on amendments to the Clean Water Act. We will be happy to provide to the subcommittee any further information you require and answer specific questions.

Mr. ROE. We want to thank you for your testimony.

I was taken by about the middle of page 3 where you made an observation.

> It is simply not a cookbook procedure analysis and evaluation of the uniqueness of the individual plant. Site-specific problems can be addressed only by the permit writer working closely with the plant operator.

I think what you are saying there is that where we have these industry related matters, such as the steel industry, somebody is going to write a framework of operation to achieve the optimum removal of pollutants; if they are, it can't be done from Washington by telephone. Somebody has got to be there to know what is going on.

Is that a fair assumption?

Mr. WEST. That appears to be a very long, involved process. Not only do they take the information we submitted to the, either the State or EPA, if they have the authority, but they also asked additional questions. There seems to be a question and answer period that goes on for several months.

The fact of the matter is that most people assumed the guidelines can be applied in a matter of a few hours and that you can tell your requirements—just the fact that EPA has not issued a significant number of permits for our industry even though our ELG's were issued over a year ago I think demonstrates the difficulty in issuing these permits.

Mr. ROE. Is that based upon the point of view that you have got to send back and forth to Washington or regional EPA offices? Or do people actually come out and inspect the operation?

Mr. WEST. They actually come out and inspect the operation. They ask for additional information. They also have to make some type of judgment as to sources within our plants that aren't subject to ELG's. There are some 57 subcategories in the iron and steel industry that are specific to our operations. Yet we also have other facilities that are not covered by those regulations.

The permit writer has to make some best engineering judgment as to what represents best practicable or best available treatment for that particular process. That becomes part of our permit also.

Mr. ROE. Which is time consuming.

Mr. WEST. Very time consuming.

Mr. ROE. We will continue to have some additional testimony.

As you know, this is the first overview. What we want to do is to develop the different theses and themes involved. We will be calling people back to get into it in more depth. But you have contributed well to our beginning. We appreciate it and will be in contact with you.

Mr. WEST. Thank you.

Mr. ROE. Thank you, Mr. West.

Our next witness is Ms. Ruth Keeton, who chairs the Howard County Council, Maryland, National Association of Regional Councils.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF RUTH KEETON, CHAIR, HOWARD COUNTY COUNCIL, MEMBER, REGIONAL PLANNING COUNCIL, BALTIMORE, MD.

Mr. Chairman, I am Ruth Keeton, Chair, Howard County Council and a member of the Regional Planning Council for the Baltimore Region. I appreciate the committee giving me this opportunity to testify on amendments to the Clean Water Act dealing with nonpoint source pollution.

Regional councils are areawide organizations of general purpose local governments encompassing a total regional community. Their primary purposes are to increase communication, cooperative decision-making and coordination among local governments, and to develop policies and programs to meet mutual problems. Regional councils have been established to deal with areawide problems such as environmental quality, housing, community and economic development, transportation and public safety. Regional councils exist today in all the nation's major metropolitan areas, including the 37 interstate ones. The National Association of Regional Councils represents over 350 regional agencies in both rural and metropolitan areas throughout the United States. Most of the designated 208 areawide water quality management planning organizations are members of NARC.

NARC strongly supports the efforts of this committee to address the problem of nonpoint source pollution. We are especially appreciative of Chairman Howard's and Representative Oberstar's leadership on this issue. The impact of nonpoint source pollution is too great to ignore any longer. Without control, it will dramatically diminish the positive effect of our point source efforts.

When the Clean Water Act was passed by Congress in 1972, the majority of water pollution control experience was with industrial and municipal point source problems. Our understanding of nonpoint source pollution was limited and early attempts to quantify the problem presented a global, almost all pervasive problem. However, through state and areawide nonpoint source efforts under the section 208, 205(j) and other programs, water quality managers have increased their understanding of the magnitude of the problem and have identified major categories and approximate sizes of nonpoint source loadings in most states. Using techniques developed in the 208, National Urban Runoff and other programs, areawide water quality managers are now able to more realistically identify those cases where nonpoint source pollution is having a significant effect on water quality and propose workable solutions.

From a national perspective, the 1982 state water quality assessments (305(b)) show that in one-fifth of the states, nonpoint source pollution is now the most important cause of water degradation in those waters not meeting uses. Agricultural nonpoint source pollution is the major source of nutrients in U.S. lakes with euthrophication problems. EPA reports that of those states (20) that have quantified their progress towards meeting the 1983 Clean Water Act goals, three-quarters (15) list nonpoint pollution as a significant source in their remaining problem waters. From my own experience centering on the Potomac and the Chesapeake Bay, we know that approximately 67 percent of the total nitrogen load and 39 percent of the phosphorus delivered to the Bay originates from nonpoint sources.

The Clean Water Act establishes a focus and rational decision-making process for the consideration of nonpoint source issues. States and local governments through their regional councils develop water quality management plans which describe both point and nonpoint sources of pollution, assist state and local officials in development of pollution control programs and provide a framework for managing water quality information on a continuing basis. Regional councils have been intimately involved in this process under the section 208 and 205(j) water quality management planning programs. Through EPA's farsighted sponsorship of the National Urban Runoff Program (NURP), regional councils (many of which were demonstration participants) have verified best management practices (BMP) and gained valuable operation experience.

In carrying out their responsibilities under the Clean Water Act, regional councils have developed water quality management plans, technical and administrative skills (that include the ability to identify and quantify nonpoint source problems and work within management systems that will implement best management practices) and management systems that are responsible for implementing plan recommendations. They have served as clearing houses and coordinators for all (or a variety of) water related activities within their regions. Councils serve as key links in the nonpoint source management networks that include state water pollution control agencies, local governments, soil conservation districts, university technicians, U.S. EPA, USDA and other government and private agencies.

More than anything the identification and solution of nonpoint source problems is an intergovernmental process. Most best management practices involve land use regulation. They cannot be carried out without the active support and cooperation of local government which has traditionally held this responsibility. Regional councils have had much success in mobilizing local governments and resources to address the nonpoint source problem. They have been able to link water quality concerns with traditional local interests like stormwater control, zoning and municipal development. Regional councils have assisted their member local governments in drafting preventative ordinances and effectively involved affected community groups in the development of nonpoint management programs.

The management of nonpoint source water pollution is very much a local government function in the Baltimore region. In Maryland, most of the powers and programs for this function have been delegated to local governments. Water pollution does not respect political boundaries. In order to be able to effectively plan for and manage water quality, Howard County has joined together with other major local governments in the region under the auspices of the Regional Planning Council as we have done in transportation and other important areas. Our region has prepared and adopted an areawide water quality management plan which has been fully certified by the Governor and EPA.

We and our neighbor local governments have been working for some time to implement this plan. Implementation was given a head start because the a Regional Planning Council passed through to its local governments about half of the "208" grant funds it received. The plan was prepared jointly by local staffs and the regional staff. Each local government has now organized itsl local staff as a local water quality management office. This means that the local people who helped prepare the plan are now working with their local colleagues to implement it. We hope to continue this cooperative implementation planning process under section 205(j) and to give implementation a major push with the assistance of the proposed legislation which I am testifying on today.

Some of the things we have done or are doing to implement our water quality plan include the following:

A task force of elected officials, water quality experts, and citizens made field inspections of the administration of our sediment and erosion control ordinance. We spotted problems and made management corrections so that compliance with program objectives rose from about 50 percent to over 90 percent.

We upgraded our stormwater management program to such a point that we will probably only have to make minor adjustments to comply with new state stormwater management regulations which have recently been adopted.

We have a water conservation program aimed at reducing water needs as well as reducing the load on our sewerage system. Water saving devices have been installed in over 10,000 dwellings. These save each house about 40 gallons a day or more than $60 a year.

We have expanded and upgraded our major sewage treatment plan so that it now produces some of the cleanest effluent in the state.

We have enacted low-density zoning for much of our most environmentally-sensitive watersheds so that pollution from urban runoff will be minimized.

Our county contributes to the budget of the Soil Conservation District which is doing very important job in implementing the nonpoint source controls in the agricultural plan adopted by our county, the Regional Planning Council, and the state.

These and other actions have been taken in close consultation with the state and downstream counties which will benefit from protection of the quality of water flowing into their jurisdictions and similarly upstream jurisdictions have worked with us in preparing and implementing their plans. Cooperative planning through the Regional Planning Council has been invaluable in providing both for the give and take and for the areawide interest necessary for practical intergovernmental cooperation.

The grant funds which can be made available to local governments and areawide organizations to promote implementation will have a great deal of leverage in terms of improving water quality because we already have most of the powers, programs, and people to take necessary action. We have already developed the necessary cooperative working relationships at local, regional, and state levels. We do, however, need additional incentives in order to exercise this leverage. I will elaborate on this later in my statement.

While appropriate consideration of abatement and control of pollution from nonpoint sources throughout the water quality management process is required by the Clean Water Act and existing EPA regulations, NARC feels nonpoint source prob-

lems have not received the attention they deserve. This has occurred for a number of reasons.

EPA has not placed enough emphasis on nonpoint source pollution as a problem of national concern. While it is understandable that the agency would try to concentrate its efforts on the more obvious point sources in the early years of the clean water program, there has not been a strong institutional focus of nonpoint issues within EPA. Termination of funding for areawide management planning under section 208 has, in NARC's view, further accentuated the perception that nonpoint source problems were not considered a high priority by EPA.

Most states have downplayed the nonpoint source problem since no money is available under the construction grants program to address it and they know they still have to manage the point source problem anyway. The definition of nonpoint source problems is an exacting science and many states have choosen to focus on point sources where the funding (construction grants) and implementation program (NPDES) is well defined. This can be illustrated by an analysis of grants made under the recently enacted section 205(j) water quality management planning program. NARC, in an informal survey, found that most of the funding was being used to support state level construction grant activities. Even in those cases where funds have been passed through to areawide water quality management agencies the focus of much of the work program is on activities that support construction grants. EPA did not make any discernable effort to direct at least a portion of these funds to nonpoint source activities.

Finally, funding for implementation of nonpoint source control programs has fallen largely to local governments. In this period of difficult fiscal constraints, local officials must weigh the benefits of nonpoint management programs against the benefits of all other services they must provide. It is difficult to justify initiating or maintaining a nonpoint management program when local officials cannot make a compensating reduction in their expenditures for treatment facilities or operations. The Clean Water Act presently does not allow any reduction in pollutant loadings caused by implementation of nonpoint source management practices to be credited toward meeting point source loading requirements. The lack of such incentives weighs the decision-making process toward initiation of construction grant type solutions where assistance is available.

In order for nonpoint source problems to be solved, NARC believes a number of steps should be taken. EPA must give higher priority to nonpoint sources problems and urge the states and local governments to do the same. Recently, NARC participated in a meeting convened by Acting Administrator for Water, Rebecca Hanmer to discuss how EPA can improve its effectiveness in this area. This is a good start and NARC is currently putting together a list of suggested changes that EPA could make in its regulations and policies to give greater emphasis to nonpoint source issues. Further, we must continue to identify and refine our understanding of nonpoint source problems, including a reexamination of data and recommendations developed in 208 plans in light of findings from the National Urban Runoff, Great Lakes International Surveillance Plan, Chesapeake Bay, Rural Clean Water and Model Implementation programs.

Nonpoint source problems tend to be site specific in terms of the types of pollutants and best management practices that are most effective. These can best be determined at the local level through existing areawide water quality management agencies. NARC does not believe massive new nonpoint source assessments must be made but there is a need to initiate or continue "implementation planning" which will give life to adopted water quality management plans.

Implementation planning would be characterized by the following activities:

(1) Assumes the problem has been identified.

(2) Assumes the management practices have been identified.

(3) Identifies the agency(ies) proposed to be responsible for implementing control measures.

(4) Identifies all legislation and rules which affect agencies activities as well as those that are related to the pollution problem and BMPs.

(5) Examines current agency practices which are or may be related to BMP implementation.

(6) Identifies benefits (water quality and others) which will accrue to the community if BMP is implemented.

(7) Identifies incremental costs to the agency, to the private sector, to consumers, to the public for various levels of implementation.

(8) Examines and identifies potential revenue sources to defray incremental costs.

(9) Describes and encourages needed changes in agency practices for BMP implementation.

(10) Identifies and encourages needed changes in legislation and rules.

(11) Suggests funding mechanism.

(12) Works with affected public officials, agency personnel and the public throughout the process.

(13) Fully documents all data, findings and recommendations.

(14) Institutes and maintains education program.

Much of this activity related to the intergovernmental process, I referred to earlier. Recent evaluations of the Model Implementation Program noted that future nonpoint source programs should provide sufficient opportunities for implementation planning and mechanisms must be established to transfer state of the art technology to projects and ensure that it is appropriately utilized. Finally, NARC believes federal and state funds should be made available to supplement local resources.

NARC supports the establishment of a national nonpoint source management program that would provide financial assistance on a matching basis to states, local governments and their areawide water quality management agencies. The program should build on the work that has already been accomplished in the 208 program. Areawide water quality management agencies should refine water quality management plans, where appropriate, in light of findings and data developed under the NURP, RCWP and MIP programs. Priority should be given to implementing preventive measures to protect critical and high quality water bodies (such as water supply) and abatement measures for those water bodies not meeting standards where NPS is a significant factor. The prevention of nonpoint source problems through the early implementation of best management practices in urbanizing areas is our most cost-effective strategy.

NARC feels the nonpoint source problem is serious enough to require the states to begin implementing a management plan within two years. States should be required to meaningfully involve local governments and areawide water quality management agencies in the development of the nonpoint source control program. Funds should be provided to local governments and areawide agencies to implement those control strategies to be performed at the local level. We would include the phrase "to the maximum extent possible" in such a provision. Regional councils have developed a high level of expertise about the water quality problems in their regions and it should be utilized.

This legislation should also contain provisions calling for the continuation of assistance under sections 205(g), 205(j) and 106. EPA should issue regulations coordinating activities under these sections with the new nonpoint source program. The regulations should also require states to give priority in funding section 205(j) to areawide agencies undertaking nonpoint source control programs as was intended by Congress. A survey conducted earlier this year by NARC, revealed that while 88 areawide and local water quality management agencies received some funding under the section 205(j) program, the majority of these funds were retained at the state level.

I must note that in order to get these funds to pass down to the local and areawide levels where cooperative planning and implementation must largely take place, there must be very explicit direction by Congress. Even under section 205(j) where Congress mandated that priority funding go to areawide and local units, Regional Planning Council has spent more than a year in intense negotiations with the state water quality agency in trying to get these pass-through funds to actually reach the local level. In particular, to assure that local governments and areawide agencies are real partners with the states in nonpoint source management, Congress should once again mandate priority funding to areawide organizations and local governments and require the EPA regional administrators to take positive steps to insure its intent is carried out.

Recognizing that the current federal budget situation will limit the amount of funds available for a national nonpoint source management program, NARC would provide additional incentives for states and localities to address nonpoint source problems. A major assist would be to allow any reduction in pollutant loadings through the use of nonpoint management practices to be credited toward meeting point source loading requirements in that area. NARC feels such an incentive is applicable in many areas and could save expenditures under the construction grants program. A necessary prerequisite to NARC's incentive proposal is the establishment of a monitoring system under the state's implementation plan that is capable of measuring their reduction of pollutant loadings resulting from nonpoint source management practices. NARC is confident that such monitoring systems are technically feasible and reliable based on the experiences of regional councils across the country.

20-955 O—84——24

NARC also proposes to allow an adjacent downstream state to petition the EPA Administrator to make a determination whether the failure to develop and implement a nonpoint source management program had an adverse impact on the petitioning state's efforts to attain national water quality goals. If the determination is affirmative, the Administrator could order the offending state to develop and implement a compatible nonpoint source management program. Failure to comply would allow the petitioning state to bring a civil action providing for penalties up to $10,000 per day during such violation. We feel this proposal leaves the responsibility where it belongs, at the state level, and provides an opportunity for states to negotiate their differences.

NARC believes the enactment of national nonpoint source management program would be a positive step in addressing this important water quality issue. We urge the committee to include such a provision in the final version of H.R. 3282. NARC appreciates the opportunity to testify before this distinguished committee and I will be pleased to try and answer any questions that you may have. Thank you.

Mr. ROE. Please proceed.

TESTIMONY OF RUTH KEETON, CHAIR, HOWARD COUNTY COUNCIL, MARYLAND, NATIONAL ASSOCIATION OF REGIONAL COUNCILS, AND MEMBER, REGIONAL PLANNING COUNCIL, BALTIMORE, MD., ACCOMPANIED BY JOHN J. BOSLEY, COUNSEL

Ms. KEETON. May I introduce John Bosley, legal counsel for the National Association of Regional Councils. I have asked him to join me in case there are questions.

Mr. ROE. We appreciate your testifying.

Ms. KEETON. Thank you.

For 9 years I have been a member of the Baltimore Regional Planning Council and am happy to speak out of that experience to you. I am also the very proud council member of a county that has a treatment plant that discharges one point phosphorus and is respected up and down the Patuxent River.

Mr. ROE. Fine.

Ms. KEETON. Our focus today, though, for regional councils is nonpoint source pollution. NARC strongly supports the efforts of this committee to address the problem of nonpoint source pollution. We are especially appreciative of chairman Howard's and Representative Oberstar's leadership on this issue. The impact of nonpoint source pollution is too great to ignore any longer. Without control, it will dramatically diminish the positive effect of our point source efforts.

When the Clean Water Act was passed by Congress in 1972, the majority of water pollution control experience was with industrial and municipal point source problems. Our understanding of nonpoint source pollution was limited and early attempts to quantify the problem presented a global, almost all-pervasive problem. However, through State and areawide nonpoint source efforts under the section 208, 205(j) and other programs, water quality managers have increased their understanding of the magnitude of the problems and have identified major categories and approximate sizes of nonpoint source loadings in most States. Using techniques developed in the 208, national urban runoff and other programs, areawide water quality managers are now able to more realistically identify those cases where nonpoint source pollution is having a significant effect on water quality and propose workable solutions.

From a national perspective, the 1982 State water quality assessments, 305(b), show that in one-fifth of the States, nonpoint source

pollution is now the most important cause of water degradation in those waters not meeting uses. Agricultural nonpoint source pollution is the major source of nutrients in U.S. lakes with euthrophication problems. EPA reports that of those States—20—that have quantified their progress towards meeting the 1983 Clean Water Act goals, three-quarters—15—list nonpoint pollution as a significant source in their remaining problem waters.

From my own experience centering on the Potomac and the Chesapeake Bay—where I serve on the land use committee created by the three Governors, of Pennsylvania, Virginia and Maryland, to recommend management priorities to them before their summit meetings this winter—we are all learning that 67 percent of the total nitrogen load to the bay and 39 percent of the phosphorus delivered to the bay originates from nonpoint sources. And we know what to look for and what to do about it.

So today nonpoint is a greater focus and one we can identify and one that needs to be addressed in a comprehensive program under Clean Water Act. More than anything, the identification and solution of nonpoint source problems is an intergovernmental process. Most best management practices involve land-use regulations. They cannot be carried out without the active support and cooperation of local government, which has traditionally held this responsibility.

Regional councils have had much success in mobilizing local governments and resources to address the nonpoint source problem. They have been able to link water quality concerns with traditional local interests like stormwater control, zoning and municipal development. Regional councils have assisted their member local governments in drafting preventative ordinances and effectively involved affected community groups in the development of nonpoint management programs.

Water pollution does not respect political boundaries. My county, Howard County, has joined together with the other six county governments in the Baltimore area representing over half the State's population, as we have done in transportation and other important areas to manage our water resources. We have approved—both the Governor and EPA fully certified an areawide water quality management plan that addresses both point and nonpoint efforts.

Our local governments have been working for some time to implement this plan. Implementation was given a headstart because the Regional Planning Council passed through to its local governments about half of the 208 grant funds it received. The plan was prepared jointly by local staffs and the regional staff.

Each local government has now organized its local staff as a local water quality management office. This means that the local people who helped prepare the plan are now working with their local colleagues to implement it. We hope to continue this cooperative implementation planning process under section 205(j) and to give implementation a major push with the assistance of the proposed legislation which I am testifying on today.

We have had some regrets that in our State and other States that the section 205(j) funds have not been distributed back to areawide and local jurisdictions as the legislation you have approved mandates. Let me give you an example of things we are doing in the region to implement our water quality plan.

A local task force of elected officials, water quality experts, and citizens made field inspections of the administration of our sediment and erosion control ordinance. When you actually go to see whether they are only in the books or are also being implemented on the land, particularly during construction, we found that more needed to be done. In my case, two additional inspectors were sent out. Every building inspector, whether he is for funding or electricity or what, is now trained to fly a water quality problem and to alert specialists to check it out immediately.

Within the region, the compliance with the program objectives of the 208 plan have risen from 50 percent to over 90 percent in those areas because you keep an eye on it on a constant basis and provide the local government staff resources to make sure it works.

We have upgraded our stormwater management program to such a point that we will probably only have to make minor adjustments to comply with new State stormwater management regulations which have recently been adopted.

We have a water conservation program aimed at reducing water needs as well as reducing the load on our sewage system. We know we can't always have those capital funds to invest in upgrading and expansion that it is urgent we use them with a sense of stewardship. Water saving devices have been installed in over 10,000 dwellings. These save each household about 40 gallons a day or more than $60 a year.

We have expanded and upgraded our major sewage treatment plant so that it now produces some of the cleanest effluent in the State.

We have enacted low-density zoning for much of our most environmentally-sensitive watersheds so that pollution from urban runoff will be minimized.

Our county contributes to the budget of the Soil Conservation District which is doing a very important job in implementing the nonpoint source controls in the agricultural plan adopted by our county, the Regional Planning Council, and the State.

These and other actions have been taken in close consultation with the State and downstream counties which will benefit from protection of the quality of water flowing into their jurisdictions and similarly upstream jurisdictions have worked with us in preparing and implementing their plans. Cooperative planning through the Regional Planning Council has been invaluable in giving us the give and take for the areawide interest necessary.

While appropriate consideration of abatement and control of pollution from nonpoint sources throughout the water quality management process is required by the Clean Water Act and existing EPA regulations, NARC feels nonpoint source problems have not received the attention they deserve. This has occurred for a number of reasons.

Most States have downplayed the nonpoint source problem since no money is available under the construction grants program to address it, and they know they still have to manage the point source problem anyway.

Finally, funding for implementation of nonpoint source control programs has fallen largely to local governments. In this period of difficult fiscal constraints, local officials must weigh the benefits of

nonpoint management programs against the benefits of all other services they must provide.

In order for nonpoint source problems to be solved, NARC believes a number of steps should be taken. EPA must give higher priority to nonpoint sources problems and urge the States and local governments to do the same.

We must continue to identify and refine our understanding of nonpoint source problems, including a reexamination of data and recommendations developed in 208 plans in light of findings from the national urban runoff, Great Lakes international surveillance plan, Chesapeake Bay, rural clean water and model implementation programs.

In other words, we have learned a lot; we know a lot. Now we need to really focus on doing it.

Nonpoint source problems tend to be site-specific in terms of the types of pollutants and best management practices that are most effective. These can best be determined at the local level through existing areawide water quality management agencies. NARC does not believe massive new nonpoint source assessments must be made, but there is a need to initiate or continue implementation planning and initiation which will give life to adopted water quality management plans. We have gone that far, and it is no time to quit.

Finally, NARC believes Federal and State funds should be made available to supplement local resources. NARC supports the establishment of a national nonpoint source management program that would provide financial assistance on a matching basis to States, local governments and their areawide water quality management agencies. The program should build on the work that has already been accomplished in the 208 program. Areawide water quality management agencies should refine water quality management plans, where appropriate, in light of findings and data developed under the NURP, RCWP and MIP programs.

It is not like starting from scratch. Priority should be given to implementing preventive measures to protect critical and high quality water bodies—such as water supply—and abatement measures for those water bodies not meeting standards where NPS is a significant factor.

NARC feels the nonpoint source problem is serious enough to require the States to begin implementing a management plan within 2 years. States have many tools, but it should be put together as a key element of a water quality program, nationally and locally.

States should be required to meaningfully involve local governments and areawide water quality management agencies in the development of the nonpoint source control program. Funds should be provided to local governments and areawide agencies to implement those control strategies to be performed at the local level. We would include the phrase, "to the maximum extent possible," in such a provision. Regional councils have developed a high level of expertise. We, as policy makers, understand and know what is needed.

This legislation should also contain provisions calling for the continuation of assistance under sections 205(g), 205(j) and 106. EPA should issue regulations coordinating activities under these sec-

tions with the new nonpoint source program. The regulations should also require States to give priority in funding section 205(j) to areawide agencies undertaking nonpoint source control programs, as was intended by Congress.

I must note that in order to get these funds to pass down to the local and areawide levels where cooperative planning and implementation must largely take place, there must be very explicit direction by Congress.

Recognizing that the current Federal budget situation will limit the amount of funds available for a national nonpoint source management program, NARC would provide additional incentives, for example, for States and localities to address nonpoint source problems. For example, a major assist would be to allow any reduction in pollutant loadings through the use of nonpoint management practices to be credited toward meeting point source loading requirements in that area.

In the Patuxent River Basin, we have agreed on a standard for nitrogen and phosphorus loadings at a level that would restore that river to the quality of the early 1950s. And we can translate that into both nonpoint and to point pounds. And so that the end product is the one that creates the benefit to the river that you wish.

NARC feels such an incentive is applicable in many areas and could save expenditures under the construction grants program. A necessary prerequisite to NARC's incentive proposal is the establishment of a monitoring system under the State's implementation plan that is capable of measuring their reduction of pollutant loadings resulting from nonpoint source management practices.

We are now monitoring monthly on the Patuxent River, for example, so we will be able to share with the residences whose practices, and, in the case of the agricultural community, are contributing to the water quality—we will be able to have a show and tell so they can see a direct linkage. NARC is confident that such monitoring systems are technically feasible and reliable based on the experiences of regional councils across the country.

NARC believes the enactment of a national nonpoint source management program would be a positive step in addressing this important water quality issue. We urge the committee to include such a provision in the final version of H.R. 3282.

We appreciate the opportunity to be included as you begin to refine and add to this legislation. We would be happy to be of any help to you at any time.

Mr. ROE. Thank you very much for your indulgence. You know, I think you have made a splendid presentation. I am not saying that just to be nice.

I think that what you have pointed out is two things that are extremely important. One is that if we are going to carry out a national water resources policy, then it has got to be carried out by everybody participating.

Ms. KEETON. That is right.

Mr. ROE. It can't be directed from Washington alone.

I think the second point is that as we now have come full circle today vis-a-vis the harbor program we had earlier, that the relationship of cleaning up that whole basin or any other basins along the line depends on how we do with nonpoint source pollution.

Ms. KEETON. Very much.

Mr. ROE. Without the two going hand-in-hand, we are just not going to achieve it.

So I want to thank you for your testimony. We are not through with your input yet; you know that.

Ms. KEETON. Yes. Thank you.

Mr. ROE. We will be calling all of these witnesses back as the program unfolds so that we can start to plug in some of the observations that we have been able to enjoy today and exchange views on.

Ms. KEETON. As a resident of the Bay, one of the watersheds, tributaries, I would like to add my support to Representative Dyson's comments, also.

Mr. ROE. I would like to see Representative Dyson add, however, nonpoint source as being an extremely important part of that legislation.

Ms. KEETON. I agree.

Mr. ROE. The gentleman from Minnesota.

Mr. STANGELAND. I, too, want to thank you, Ms. Keeton, for excellent testimony, and a concern of a problem that I think perhaps the Congress, because of resources and priorities, hasn't addressed as well as it might. It is not only EPA's problem or fault. It might well be part of our problem.

I think the concept was that point sources could be addressed first and resolved; then nonpoint came in. I look forward to future hearings on this matter.

Mr. ROE. Thank you very much for being with us this morning.

Before we recess, I would like to enter into the record at this point a statement received from our colleague, the Honorable Brian Donnelly of Massachusetts, a member of this committee and the Subcommittee on Water Resources.

[Statement referred to follows:]

STATEMENT OF HON. BRIAN J. DONNELLY, A REPRESENTATIVE IN CONGRESS FROM MASSACHUSETTS

Mr. Chairman, The Clean Water Act has been on the books for eleven years now. In that short span of time, our nation has worked together to make dramatic improvements in the quality of our rivers, streams, and lakes.

Waterways that were open industrial and municipal sewers just a few years ago now run clean. Delicate speicies of fish and plant life have been reintroduced successfully in many cases. But the job is not complete.

As part of our effort to restore the quality of our inland waters, I urge this subcommittee to address the growing problem of acid rain. In vast areas of our country, and certainly in the New England region, acid precipitation is un-doing much of the work we have done to make our waters safe for aquatic life and for recreation.

A recent study in Massachusetts shows 82 percent of our lakes and streams affected by acid rain. One stream in nine cannot support fish at all. Ponds and lakes that have been stocked with fish are so acidic, the fish are unable to reproduce, and catches have fallen steadily and sharply in recent years. In the Quabbin Reservoir, a major fishing spot, the harvest dropped by one-third in 1981, and by another 10 percent last year.

What is happening in Massachusetts is symptomatic of what is happening through much of this country and Canada. The fact is that a substantial amount of water pollution is currently caused by airborne pollutants. Our nation's need for comprehensive legislation to combat water pollution requires us to address the issue of acid rain. I encourage this subcommittee to take the first positive legislative steps to control this serious threat to our environment.

Mr. ROE. The subcommittee will stand in subject to the call of the Chair.

[Whereupon, at 1 p.m., the subcommittee recessed subject to the call of the Chair.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, SEPTEMBER 20, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington D.C.

The subcommittee met at 10:07 a.m., in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

This morning the Subcommittee on Water Resources resumes its hearings on possible amendments to the Federal Water Pollution Control Act. We will have another hearing Thursday of this week as well as additional days in the future in order to accommodate the very large number of persons and organizations who have expressed a desire to testify on this most important clean water issue.

During these hearings we expect to receive testimony on a wide range of issues, including extension of the compliance deadlines for achievement of best available technology by industry, the pretreatment program, nonpoint source pollution, water quality standards, and other issues relating to our efforts to restore and maintain the quality of the Nation's waters. The information developed at these hearings will enable us to ascertain what amendments are appropriate in order to improve the Federal water pollution control program and make it work more effectively.

Before we call our first witness, we have our chairman of the full committee, Jim Howard from New Jersey, and the Chair would defer to the chairman of the full committee.

The CHAIRMAN. I thank you, Mr. Chairman, and I will be very brief.

What I want to do is to congratulate you and congratulate all the members of the subcommittee for the work that you are doing now concerning clean water, which is such a vital, vital issue in many ways all over this Nation, and the fact that you are looking deeply into the basics of the problem. This subcommittee has certainly done a monumental task already on the water projects legislation which passed this committee. That would be a fine badge of accomplishment if it were the only thing that this subcommittee did during this Congress. I just want to thank you on behalf of all the other members of the full committee for the work you are doing on this vital subject and we certainly look forward to seeing a fine,

fine bill come from this subcommittee out to the full committee. I just wish to congratulate you on your effort.

Mr. ROE. I want to thank the Chairman for his generous comments.

The Chair defers to Mr. Stangeland.

Mr. STANGELAND Thank you, Mr. Chairman.

I want to join you in welcoming all of the witnesses and will testify on the issue of maintaining and improving the quality of the waters of the United States.

The Federal Water Pollution Control Act amendments, commonly known now as the Clean Water Act, continues to be a valuable tool for insuring that this Nation will always have an abundant source of clean water.

This act has been basically sound environmental legislation for over 10 years. Nonetheless, we should always consider any legislation that will improve the purposes of this act. For instance, significant changes were made in 1981 to title II, the construction grants program.

Among other things this year, some of the funding provisions of the Clean Water Act must be addressed. Section 106, the State grants provision, and section 314, the clean lakes program, are examples of funding provisions that expired last September. Such provisions need to be reviewed and considered for continued funding. Other major issues that deserve full consideration this year include compliance dates, pretreatment, nonpoint sources, and permits, among others, as you so eloquently outlined.

Today, and in subsequent hearings, we will be hearing suggestions for changes that can be made to improve the Clean Water Act. In many cases I am sure we will hear arguments to not change parts of the act. In any case, the goal must be a viable piece of legislation that is tailored to meet the needs of today and the future.

Mr. Chairman, I look forward to hearing from our witnesses today. I hope that upon consideration of their views, we will be able to craft this legislation so as to continue the Nation's efforts to maintain and improve the quality of our rivers and lakes.

Thank you, Mr. Chairman.

Mr. ROE. I thank the gentleman from Minnesota.

We have the honor as our first witness today, the Honorable Abraham Kazen from Texas, a distinguished leader in Congress in many fields, particularly in water supply and water quality. So, we want to welcome our colleague here today.

TESTIMONY OF HON. ABRAHAM KAZEN, JR., A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS

Mr. KAZEN. Thank you, Mr. Chairman.

Before I start my presentation, I want to assure you that I appreciate the work that your subcommittee is doing in this very vital facet of American life. I appreciate the cooperation, the work that we have done together. As you know, I chair the subcommittee on Power and Water Resources of the Interior Committee, and I have had the privilege of working very closely with you and the members of this Committee.

Mr. Chairman, I am here today to express my appreciation for the work your committee is doing in the critical area of clean water and to speak briefly on some of the problems facing my State and, in particular, the city of San Antonio.

It is my understanding that Mayor Cisneros of San Antonio and some of our city officials hope to appear before this committee at some future date to address the needs of the city, but I would like to take this opportunity to outline some of their problems in a general way and perhaps to suggest one or two possibilities for future consideration.

San Antonio is faced with coming up with $448 million for sewage treatment and sewer facilities to meet the Federal Government's 1988 deadline for secondary treatment and the State's water quality standards.

Approximately $300 million of the $360 million program is needed to meet backlog and existing treatment and collection needs, and $60 million is for growth, yet the Texas Department of Water Resources estimates that the city may receive a maximum of only $50 million in Federal funds during 1984 and 1985. We are talking about 10 percent of the total amount although Congress provided for 75 percent matching grants, which has not yet been appropriated.

The major element of the San Antonio program is the replacement of an outmoded and totally inadequate facility at Rilling Road with the Dos Rios Plant. Rilling Road is so objectionable, the stench is so bad, that it has actually stifled growth in the southern part of the metropolitan area.

EPA approved the plan in April 1980. It is agreed that the Dos Rios Plant will have major water quality benefits for the San Antonio River and the San Antonio National Historical Park. San Antonio played by the rules, Mr. Chairman, and conducted five major planning steps, from regional plan through a public participation program, and it has done all that it has been asked to do by the government.

The only thing lacking is adequate funding. At this point, I would add that I know there are local jurisdictions across the country faced with the same deadlines and compliance schedule, and I believe that improvement of water quality has major public health, economic and environmental benefits. This is a legitimate national endeavor, and it should be accomplished.

Mr. Chairman, I endorse additional funding. As all of us know, there are many issues where we would like to allot more funds, but because of national priorities we must bite the bullet and cut, postpone or eliminate.

I simply do not see how we can afford to do this when the legitimate national goal of cleaning up our water is concerned. It needs to be confronted squarely and handled promptly according to timetable. Unfortunately, because of the level of funding, this is not being done, and projects delayed are projects made more expensive for future generations.

I would also hope that we in Congress can come up with some way of targeting areas of greater need, such as replacement of Rilling Road when it is obvious that it is causing a health problem for a great growing metropolitan area. One way might be in legislation

allowing the States to target critical water quality areas which the current law does not allow.

Our State officials—and I hope you hear from them in the near future—feel they could do a better job distributing the money based on need if the laws were changed to give them more flexibility. In the 1981 amendments, changes were made in funding priorities to allow for only backlog needs and none—none for growth. Texas suffered from this because some of our cities are growing faster than the backlog needs can be handled, and I hope that your committee will take this into consideration during your deliberations.

I appreciate you hearing me out today, and I urge you to listen carefully when you hear from our Texas officials and consider the difficult problems facing them and all of our local governments endeavoring to do what we have told them must be done.

This is an issue with wide support. I know it is a difficult problem for this committee, but I urge you to continue your usual good job.

Mr. ROE. We thank our distinguished colleague for his excellent testimony and I for one agree most fully in what the points that he has made, and we will work in that direction.

Are there any further questions for our distinguished colleague?

The gentleman from New Jersey.

The CHAIRMAN. Thank you very much, Mr. Chairman.

I just wish to thank the gentleman from Texas for appearing here today. He is one of the main reasons we have this fine cooperation between his Subcommittee on Water and Power Resources that has such an interest in water on the Committee on Interior and our committee. I thank him also for his testimony facing up to the fact of what we must do. There are some areas where cutting back money at this time while in the long run it is going to cost us a lot more. We do know from my area in New Jersey where we had a great deal of pollution of our streams when this committee started the first major clean water legislation back in 1965, we have been able to see in 17 or 18 years the slow progress we have been making. We have seen the fact that our rivers, our streams, our bays are being cleaned up very slowly. We have heard from our fishermen of the kind of fish that are back in the area that we had not seen in 20 years. Our inlets are becoming cleaner and we are beginning to see the small crabs coming back into the inlets where they had not been for many, many years. But with the cutbacks in sewerage treatment plant construction funds by more than a half in the last two budgets that we passed, we have seen a very fast deterioration of this situation. And we have come to the conclusion that although it takes a long, long while to clean up the waters in this country, it does not take much time at all to see them ruined. That is why we are hoping that we will be able to come out of this committee and present to the floor a bill with reasonable funding for the things that we know we have to do, the situations that we can begin to correct, without any breakthrough in technology. This may be one area in Federal spending where you can solve a problem by throwing money at it because we know what we have to do. The cold facts of the dollars are there. If we do that, then we can progress so that we will have a decent environment in the future.

And for every year that we fail in that, we may be giving ourselves an additional 8 to 10 years of much more expensive funding to try and clear up this situation. So I am very, very happy to hear from the gentleman from Texas who shows that this problem is not just an industrial Northeast, Upper Midwest problem. We have a big job to do for all of our people all over the country. I think that is a very, very good sign.

I wish to thank the gentleman for his appearance and for his support for decent clean water legislation. I am sure it will have a profound impact on other Members of the House when we do bring what I am sure what will be a fine bill before the House of Representatives in the near future. And I want to thank him very much for his very valuable testimony here today.

Mr. KAZEN. Well, Mr. Chairman, it is we, the other Members of this Congress, who are not privileged to sit on this committee that owe you and the members of your committee a great debt. There is no question but what the health of the people of this country must have the highest priority. And when you have a situation like I have in our city of San Antonio, where under the Clean Water Act they were promised 75 percent funding, we do not even get 10 percent. At the same time, there is a deadline of 1988 and our people just do not have the money to do it locally. The residential monthly sewage fee the total program will require will be in 1988 of $31. A fivefold, fivefold Mr. Chairman, increase of 1982 rates.

Mr. Chairman, we have only received $2 million. Because we took the time to get the complete package and not having done it in stages, the way Dallas did, the way Houston did, they received millions of dollars, but we followed the law which said we want a comprehensive plan. We did it. Now it is complete and the money is not there. Yet we have got that deadline to meet, we have that terrible, terrible situation down there in the center of the city where the health of the people of that great metropolitan area is endangered every day. The stench is so bad, Mr. Chairman, you cannot even get in that part of town, and it is stifling the growth. And that is where we have got to make these corrections, highest priority possible, clean water, the health of our country. And for this, Mr. Chairman, knowing what your interests, the interest of this committee is, we want to thank you for what you are doing and certainly we stand ready to help you.

The CHAIRMAN. That may be why it is beneficial that we do have a Federal Government that does have the type of vast resources for collecting and equitably distributing funds as needed with proper flexibility for the local people. We certainly hope to be able to respond to that.

So I agree totally with what you said and thank you an awful lot for coming here today.

Mr. KAZEN. Thank you, Mr. Chairman.

Mr. ROE. Are there any further questions for the distinguished Chairman from Texas?

We want to thank you very much for your splendid contribution.

Mr. KAZEN. Mr. Chairman, thank you.

Mr. ROE. Our next witness this morning is the Honorable Lang Marsh, who is Deputy Commissioner of the New York State De-

partment of Environmental Conservation, and is representing Mr. Henry G. Williams.

We want to welcome Mr. Marsh to our committee.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF NEW YORK STATE COMMISSIONER OF ENVIRONMENTAL CONSERVATION HENRY G. WILLIAMS

Good morning Mr. Chairman and members of the subcommittee, I am Langdon Marsh, executive deputy commissioner of the New York State Department of Environmental Conservation. On behalf of Commissioner Herny G. Williams, I appreciate the opportunity to share with you some New York views relative to clean waters.

In our experience, the current Water Act is basically sound and has led to significant improvements in the quality of New York's and the Nation's water. We are proud of our accomplishments but recognize that adjustments are necesssary if we are to sustain these accomplishments and also to progress with the difficult toxic and hazardous substance problems facing us. We must also recognize the continued need to complete the upgrading of sewage treatment facilities through the construction grant program. Specifically for the more important subject areas we recommend:

1.. Funding authorization: Retain authorized level of $75 million for section 106 program grants for the next five years and $22.7 million for the section 104 training grants.

2. Construction grants: Extend the program for a minimum of four years and increase the annual appropriations to $3.5 billion nationally. Further, funding to States for program grants administration should be continued through section 205(g).

3. Compliance dates: Extend deadlines for BAT for industry and secondary treatment for POTWS to July 1, 1988.

4. NPDES permit duration: Extend permit term from 5 to 10 years.

5. Water quality standards: Retain section 3.3 intact.

My summary comments will focus on those amendments we believe are most critical to enhancing the national framework for water quality management while providing the flexibility the States need to administer their responsibilities.

1. FUNDING AUTHORIZATION

State grants under section 106 represent the primary source of federal funding for the administration of our water pollution control program responsibilities. Any reduction in real dollars to State programs at this time could have a significant impact on our ability to deliver basic programs. Reduction of our monitoring network, curtailment of our inspection and enforcement activities relative to major facilities, and the return of delegated programs such as NPDES are real possibilities within the next few years, given administration proposals and state resource constraints.

It is totally inconsistent to promote the enhancement of State authority and flexibility while simultaneously withdrawing an already inadequate Federal support base. It is further incongruous that Congress might reduce this support just as the issues become more complex. As we turn the corner on responding to the conventional pollutant problems, which still exist, I might add, we're faced with the arduous task of adequately regulating the discharges of toxic/harzardous contaminants to our water bodies.

As there are timing and statutory problems with supplementing 106 funds with 205(g) and (j) allocations, we can't support EPA's contention that offsetting funds might be available. It remains essential that 106 funds continue and to reach a level of $75 million dollars and that they be sustained.

2. CONSTRUCTION GRANTS

Historically the time period from project initiation to project completion has been 7-10 years. Thus, any program extension must be for a minimum period of four years to accommodate the planning and design periods necessary to get a project to the contruction phase. A period of time such as this along with consistent, available

funds will permit all levels of government to properly plan, budget and manage the program to improve water quality.

Funding in the past has been erratic (appropriations less than authorization) and generally less in each succeeding year. Further, current levels are insufficient to meet the inflation needs of the projects proceeding under the program. New York State has needs to excess of $16 billion with projects in the grants program totalling $4.5 billion and only $271 million annually to fund them. A minimum increase in appropriations to $3.5 billion nationally is needed.

The 1981 amendments remove from Federal funding eligibility the project categories of major rehabilitation, combined sewer overflow abatement and collector sewers unless the Governor of a State elects to set aside a portion of a State's allotment for these categories. Given the large need, a decrease or lack of funding available for major rehabilitation and combined sewer overflow abatement strikes directly at deteriorating municipal infrastructure. Building new treatment plants for our cities, when the conveyance facilities have collapsed or are in danger of collapsing will not have a water quality benefit. The total system must be reliable and using setasides short changes this effort. Major rehabilitation and combined sewer overflow abatement should be restored as eligible categories so that we can get on with the job of improving municipal infrastructures.

The present distribution system for Federal funds should be continued using the needs based allotment formula already in place. Further it should continue to reflect all categories of needs, since funds will continue to go to the newly ineligible categories under setasides or, if as proposed above, to these categories if eligibility is restored.

Funding should continue for States to administer the program under delegation agreements from the Federal Government. Further, consideration must be given to increasing the amounts available for this purpose to account for inflation. The same amounts annually only serve over time to result in less and less staff availability to accomplish the same or increased workloads. Again program stability must be maintained.

3. COMPLIANCE DATES

EPA's failure to meet statutory deadlines for establishing effluent and compliance standards and guidelines has created significant problems for those States, like New York, with aggressive management programs. Our commitment to issue second round permits using "best professional judment" places us in a potentially uncomfortable economic disadvantage to other States that may be waiting for EPA to set national limitations. More importantly, public health and the environment continue to be adversely affected, as water quality standards will not be attained or maintained in some improtant water bodies.

In that we recognize that there may be practical reasons for extending statutory compliance dates, we urge Congress to provide EPA with both resources and a clear mandate to ensure that standards and guidance will be promulgated in time to make compliance dates realistic.

We recommend that Congress extend deadlines for bat and municipal compliance to July 1, 1988 if EPA can promulgate national effluent standards by July 1, 1984.

4. NPDES PERMIT DURATION

Ten-year permits would give regulating agencies the ability to concentrate their resources on permit compliance rather than permit administration. Obvious advantages to the permittee are a reduction in paperwork and a more stable basis on which to make business decisions.

In New York, ninety percent of the point source pollution load comes from ten percent of the sources. Ten-year permits will allow us to concentrate our resources on the more significant discharges. We've always had, and should continue to have, the authority to revise permits prior to their expiration to update permit requirements or schedules. It is recommended that the duration of NPDES permits be extended from five to no more than ten years.

5. WATER QUALITY STANDARDS

We are surprised and dismayed at the array of proposals to revise the water quality standards process. Some legislative and regulatory proposals are tampering with the very basic State right to classify through best usage determinations and establish standards within a public hearing process while being overviewed by the EPA.

We cannot support variations of this process either by those who believe mechanisms should be provided to make case-by-case point source exceptions (lenient approach) to those who believe no changes should be allowed (freeze approach) to those who believe toxic numerical requirements should be mandated within given time frames (stringent approach). Rather we urge that no hasty judments be made which may alter an already equitable and viable water quality standard setting process, we therefore recommend no changes to the legislation at this time.

CLOSING REMARKS

In closing, I would like to stress that a true Federal, State, local partnership can only be realized if there is a strong legislative mandate for clean water, implemented by clear concise regulations and an adequate resource base. We trust that Congress will give both of these on its deliberations on appropriations and amendments to the Clean Water Act.

Thank you for the opportunity to appear before your subcommittee today.

Mr. ROE. Please proceed.

TESTIMONY OF LANGDON MARSH, EXECUTIVE DEPUTY COMMISSIONER, NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Mr. MARSH. Good morning. Thank you, Chairman and good morning to you and the members of the subcommittee.

I am Langdon Marsh, executive deputy commissioner of the New York State Department of Environmental Conservation. As the chairman has mentioned, I am here on behalf of Commissioner Henry G. Williams of the Department of Environmental Conservation. I do appreciate the opportunity to share with you some of our concerns about clean water legislation that is now before you.

We believe that the clean water legislation that was represented by the Federal Water Pollution Control Act of 1972, as it has been amended, is basically sound. The approach is correct, as Chairman Howard has mentioned, and we believe that the basic structure of the act should be continued. We think a lot has been done not only in New York and other northeastern States but around the country to accomplish the goals of that act. But we know that there is a great deal more that must be done, and particularly in the area of toxic and hazardous substance problems that we have before us.

The statement indicates the five areas in which we propose either that amendments be made or not be made as the case may be and I will briefly discuss each one of them.

On funding authorization, under section 106 and section 104 training, we strongly recommend the retention of the authorized level of $75 million for the 106 program and $22.7 million for the 104 training grants. These State grants under 106 are the primary source of Federal funding for the administration of our water pollution control program and we have a very significant and important monitoring and surveillance program in the State of New York. We could not stand any reduction in that program; 106 funds are an important part of the support of that program.

We are also looking at a number of problem areas that require enhancement of our efforts from the levels of past years and we think that it would be essential that Congress either maintain or increase its support for our programs so that we can begin to address these problems.

Right now, for example, we are trying to get a groundwater pollution program off the ground, so to speak, in Long Island and

other parts of our State. We need resources to do that. This is an absolutely essential part of our water resources, water pollution control responsibilities; we have not done enough. We recognize that.

There are toxic problems throughout the State. We need to do something.

The question of nonpoint sources was mentioned by the chairman in his opening remarks. We are beginning to struggle with that in places like Lake George near the Adirondacks to come up with adequate water management plans that will deal with the problems of nonpoint sources. We cannot do that kind of planning without the support of the program grants through the Federal Water Pollution Control Act.

We also would like to see the 106 funds continued even if there are 205 (g) and (j) allocations to the State.

On construction grants, we have a great many projects in the pipeline but only a small or dwindling amount of Federal resources available to address the problems. All of these projects require long leadtimes and we need to have consistently available funds so that we can properly plan, budget and manage the program.

Our needs have been estimated in excess of $16 billion on a statewide basis. The total projects in the program today total about $4.5 billion, but we only have annual appropriations of approximately $271 million to fund them. So we are suggesting an increase in appropriations to $3.5 billion nationally to meet this need.

We are also concerned about changes in eligibility requirements that the 1981 amendments put into effect, particularly in the areas of major rehabilitation, combined sewer overflow abatement, and collector sewers.

As you know, these are not eligible unless the Governor of the State elects to set aside a portion of the State's allotment for these categories. Given the large need we have, a decrease or lack of funding available for major rehabilitation and combined sewer overflow abatement strikes directly at deteriorating municipal infrastructures.

Building new treatment plants for our cities, when the conveyance facilities have collapsed or are in danger of collapsing will not have a net water quality benefit. The total system must be reliable and using set-asides shortchanges this effort.

So we are suggesting that major rehabilitation and combined sewer overflow abatement should be restored as eligible categories so that we can get on with the job of improving and restoring municipal infrastructures.

The present distribution system for Federal funds should be continued using the needs based allotment that has already been in place.

As I mentioned, it should continue to reflect all categories of needs so that we can get on with the job. We are also of course interested in continuing the amounts available under 205(g) to administer the program as the needs become more complex, as they increase, as we have to deal with exotic problems which we did not have to deal with before. We need at least the amount of staff availability we historically had to accomplish the same or increased workloads.

20-955 O—84——25

On compliance dates, we recognize that EPA has had considerable problems over the past years in coming up with national effluent standards and that has created problems for both municipalities and industry.

We are suggesting the extension of deadlines for best available technology and municipal compliance to July 1, 1988, assuming that EPA can promulgate national effluent standards by July 1, 1984. And we urge Congress to provide EPA with the resources and a clear mandate to insure that standards and guidance will be promulgated on time to make these compliance dates realistic.

Duration of permits. We manage a lot of permits in New York State, 1,500 priority discharges. We do a lot of paperwork. Not all of it is to great benefit. We are suggesting that a 10-year permit would give us as a regulatory agency the ability to concentrate our resources on permit compliance rather than permit administration. We should of course continue to have the authority to revise permits prior to their expiration, to update requirements or schedules.

Water quality standards. We are concerned with the number of proposals to revise the water quality standards process. There are some legislative and regulatory proposals which would tamper with our basic State right to classify waters through best usage determinations and establish standards under the oversight of EPA. So we do not support variations of the existing process, such as to make case by case point source exceptions, to make no changes or freeze changes altogether or to mandate toxic numerical requirements within given timeframes.

We urge that no hasty judgments be made which alter an already equitable and viable water quality standard setting process. And therefore no changes should be made in the legislation at this time.

In closing, I would like to stress that a true Federal, State, local partnership can only be realized if there is a strong legislative mandate for clean water, implemented by clear, concise regulations and an adequate resource base.

We trust that Congress will provide all of these in its deliberations, appropriations, and amendments to the Clean Water Act.

And again, Mr. Chairman, thank you very much for the opportunity to make this presentation to you. I will be happy to answer any questions.

Mr. ROE. I want to thank the gentleman from New York for his substantive presentation to the committee.

Are there any questions to the gentleman from New York?

The gentleman from Minnesota.

Mr. STANGELAND. Just a couple, Mr. Chairman.

Mr. Marsh, how adequate are the act's water quality monitoring authorities?

Mr. MARSH. In what sense, sir?

Mr. STANGELAND. Are we doing sufficient monitoring?

Mr. MARSH. Well, we do not believe so. For example, in New York we have the ability to maintain about 110 ambient monitoring sampling stations taking monthly samples. On the other hand, we have approximately 70,000 miles of waterways throughout the State. We would like to be able to do a great deal more ambient

monitoring. We would also like to increase by doubling or tripling our surveillance monitoring of key discharges.

As I mentioned, we have about 1,500 principal industrial discharges throughout the State and we are only able to really do surveillance sampling of about 200 of these per year. We think we ought to be doing a great deal more than that.

Mr. STANGELAND. Is your restriction monetary?

Mr. MARSH. It is purely monetary, yes. We have the equipment, we have the capability within our State health department to do very sophisticated analyses for toxics. But we do not have the ability to take the samples or to get enough people to analyze them at our State Health Department.

Mr. STANGELAND. What more should we be doing in the area of nonpoint source pollution control?

Mr. MARSH. Well, I believe that the areas that have been identified as nonpoint source problems are areas that are principally of concern to State regulatory authorities. I think that the proper role of the Federal Government is to provide continued resources to States, to do the analyses, planning, cooperative working with farmers and others to come up with adequate plans and programs to deal with the problem.

I gave as an example in my testimony the cooperative arrangement which we are working out with the communities around Lake George, which is a highly important water body in our State, trying to address this problem, to maintain the very pure water quality in that area. We think that a cooperative approach involving Federal planning and support funds and State cooperative arrangements with local governments and some regulatory authority, perhaps in some areas to deal with erosion control and other matters, would be proper.

Mr. STANGELAND Do you think then that we need a major nonpoint source program at this time? Do we need it and is the need $16 billion, did I understand you to say?

Mr. MARSH. That is the total needs per the EPA's needs study, yes.

Mr. STANGELAND. But is that point or nonpoint?

Mr. MARSH. That is just point sources.

Mr. STANGELAND. So we have a long way to go in correcting the point source problem. Should the priority be moving nonpoint pollution control into the program at this time or should we continue to address the point sources?

Mr. MARSH. Well, I believe that we have to do both. We believe within the State that we have severe water quality problems that come from both sources. In our principal waterways the problem has traditionally been a point source problem. However, we have areas such as the sensitive lakes in the northern part of our State and the bays in Long Island where the problem is probably as much or more a nonpoint source problem as it is a point source problem.

We believe that we need the adequate informational and analytical ability to assess the actual problems, nonpoint source problems in these areas and to devise nonstructural and regulatory and other solutions as well as perhaps some structural solutions.

I do not think at this point that we would suggest a major construction-type program but I do think that it is important that the States have the resources to gather the information, analyze the problem in more detail than the 208 program has enabled us to do and then come up with legislative and other solutions, principally I suspect of a nonstructural nature in order to address the problems in key water basins throughout the State.

Mr. STANGELAND. Thank you, Mr. Marsh.

Mr. ROE. The gentleman from New York, Mr. Nowak.

Mr. NOWAK. Thank you very much and let me welcome Mr. Marsh before the committtee. He is a new member of the DEC team and certainly a welcome one as far as many people that have watched this program develop over the years in New York State. And I know that not only are his contributions going to be many to the State but I think because of his background and the expertise that he has garnered in water resource matters over many, many years, he will stand him in good stead to develop a meaningful program for the State. Also, I think he can be a great contributor to this committee in trying to fashion the Federal legislation which will allow the State to move forward.

Mr. Marsh, you indicated in your testimony that combined sewer overflow abatement should be restored as a grant eligible category. The Clean Water Act, as you discussed, does provide a special source of funding for the correction of that problem.

I am wondering why, in view of that so-called special source, in your opinion, should that category be restored to full eligibility?

Mr. MARSH. Well, I appreciate your kind remarks and I will certainly do my utmost to live up to them.

On the question—we think that all municipal sources should be—all municipal problem areas should be treated alike because the contribution of these various categories to our water quality problems and our public health problems is not clearly just from one source or the other. For example, I have some figures here that indicate, of that $16 billion in needs, a good 5.6 billion or about a third is from combined sewer overflow correction, and only 3.4 billion of that number is for new treatment plants. So we believe that the overall needs of the State should be treated alike, that we should be able to prioritize them in the fashion that our true needs reflect.

The special funding provided by the Clean Water Act only addresses discharges to marine areas and has not been funded at an adequate level. So whatever our most severe problems are, we think that the legislation should enable us to address them, whatever category they fall into.

Mr. NOWAK. What you are saying basically is that if the percentage problem of pollution comes from combined sewer overflows, that may in various communities have to be attacked first. There seems to be little sense in going into a construction grant if the major portion of the pollution is emanating from another source, and I think that is the thrust of your testimony.

Mr. MARSH. That is correct.

Mr. NOWAK. And that if we could provide that flexibility within the Federal mandates, you would be able to attack the harshest

polluters or polluting sources prior to spending large sums of money and perhaps only get at 40 or 50 percent of the problem.

Mr. MARSH. That is correct.

Mr. NOWAK. I do not want to take too much time. I have other questions which I will submit later.

We talk about the need for total infrastructure rehabilitation. I wonder if you could relate this problem to the infrastructure needs of the State? How does your testimony relate to that?

Mr. MARSH. Well, as I pointed out, we have a major, as I characterized it, $16 billion problem, just in the area of correcting our water pollution problems. And the grants program that has been ongoing is, of course, basically an infrastructure development program. We think that continuation of that would do a great deal to help New York State rebuild its infrastructure and an adequate level of construction grants would go a long way to help us do that.

Again the removal of major sewer rehabilitation from the category of eligible grants by the 1981 amendments somewhat hampers our ability to address the infrastructure needs of the State. Of the figures that I began quoting to you before, approximately 3.8 billion of the 16 billion we need is in major sewer system rehabilitation. So again it would be important to try to include that as an eligible category and to increase the grants to enable us to begin addressing that need. It is also a very important aspect in terms of policy here.

I think that a Federal policy discouraging major sewer system rehabilitation is in effect saying to the older central cities that their needs are not as important as areas that are developing, and I think it is important that the Federal policy be neutral on that score.

Mr. NOWAK. At least give the flexibility to the States to take care of your own particular needs.

I want to thank you for your statement. I think it is a very relevant statement. It is something that this committee, I am sure, will give great thought to as we work to improve this whole program.

Thank you very much.

Mr. ROE. The gentleman from New York, Mr. Molinari.

Mr. MOLINARI. Thank you, Mr. Chairman.

I have a couple of questions. Before I ask the questions, I would like to extend my welcome also and make the observation that we are very happy with the work that is being performed, as a New Yorker, by the new Commissioner. The prior one, in my opinion, was an absolute disaster as far as New York State was concerned. But it is refreshing to see the approach that is being taken now, and I particularly want to compliment you folks on the job you did on your odor identification problem that vexes my congressional district. It was a marvelous work product and I was very much impressed, and I look for good things to happen.

You say that legislative and regulatory proposals are tampering with the basic State rights to classify water bodies through best usage determinations and to establish appropriate standards.

Can you elaborate upon this concern? Where do you see the problems or conflicts?

Mr. MARSH. Well, I think that the chief conflict that we have at the moment is with EPA's draft policy for the review of advanced

municipal wastewater treatment facilities. At this point, the agency seems to be willing, and it has happened in a couple of cases in New York, to question the appropriateness of a designated use of a water body that has been established by the adoption of water quality standards, including a best usage classification adopted by the State under an EPA approved program and the standards and use designations have actually been approved by EPA as part of the Water Pollution Control Act. And then the policy in effect turns around and says that in the context of a particular grant for a project, EPA can question whether or not what is the usage is actually going to be achieved by the proposal to construct the sewage treatment facility. In one case, for example, what EPA will support in terms of a grant for a particular facility would fail to meet the State water quality standards, and we have a big argument with them about that. We are put in a position, having adopted the water quality standards, of then having to go back and rejustify them with great technical and sophisticated analysis. We do not think we should be put in that position, and that EPA should support what is necessary to meet water quality standards, as was the original intent of the act.

We are also concerned about some of the legislative proposals that we have heard about that would tend to weaken the water quality standards setting process, as I mentioned in my testimony.

Mr. MOLINARI. One more question.

How can New York claim that it has an aggressive permit program, yet still need EPA support in promulgating the best available technology standards?

Mr. MARSH. Well, we have a very professional staff working in our water quality program. They do a good job but what they are called upon to do in the current regulatory climate is to exercise their best professional judgment in a whole series of toxic problems and other problems where they simply do not have adequate guidance from EPA. This is difficult in two respects.

One, it consumes a considerable amount of staff effort to come up with these best professional judgments, and I believe they do a very good job at it, but, second, it tends to put New York, which does this job or wants to do this job, somewhat at a disadvantage with other States who might not have the ability to put those resources to work to come up with those standards and are simply awaiting Federal guidance and effluent standards later on. We think that everybody should be on the same track and we think that EPA is the organization that was designated as a matter of policy by the 1972 act to do that work. We hope that you give them the support to continue that and finish it promptly.

Mr. MOLINARI. That leads me then to one more question.

What do you perceive as the proper role of the Federal Government in this area as opposed to that which would be assumed by the States?

Mr. MARSH. Well, the basic balance that has been achieved up to now is I think a good one. We have the ability at the State level to determine our priority needs; we have the ability to set our own water quality standards, best usages of waters and so forth. We have the ability to run our own permit program through the delegation of the NPDES process. And basically the system works.

We think, as I mentioned, some of these new policies tend to interfere with what I think was a well-functioning structure in the first place. I think the Federal Government's role has properly been to collect funds and distribute them fairly to States according to their needs, to provide oversight of the water quality standard setting process and permitting process, to make sure that the goals of the act are going to be achieved.

Mr. MOLINARI. Do you have the ability to detect the presence of industrial users of toxic waste being dumped into your waterways?

Mr MARSH. We have the ability to do it but not nearly to the extent that we would like.

As I mentioned, we would like to double or triple our surveillance capabilities.

Mr. MOLINARI. But if you had double or triple the resources, then you would not believe that you would need an enhanced role on the part of EPA in that area?

Mr. MARSH. That is correct. We think that the States are best equipped to carry out the day-to-day monitoring, surveillance, and permitting aspects of the program and to deal with the construction grant priorities as well.

Mr. MOLINARI. Thank you very much.

No further questions, Mr. Chairman.

Mr. ROE. The Congresswoman from New York, Ms. Ferraro.

Ms. FERRARO. Thank you very much, Mr. Chairman.

I too want to welcome the Commissioner and I appreciate his testimony. My colleague from Massachusetts stated that it is New York Day, and, of course, I am most delighted that it is.

I just want to followup a little bit on the questions of my two colleagues with reference to the needs of the State and the participation of the Federal Government in those needs, and I am talking about the dollars.

You indicated to Congressman Nowak that the size of the problem in New York State is about $16 billion, is that right?

Mr. MARSH. That is right.

Ms. FERRARO. What percentage of that is available through Federal assistance and what percentage does the State assume responsibility for in dollars?

Mr. MARSH. Well, we have under the present program about a $350 million a year program in construction grants of which 75 percent is Federal dollars. And under present law, 12½ percent is put up by the State and 12½ by localities. As I mentioned, the $271 million a year is against a total need for just those projects that are in our process, either grants have been given to or have been applied for, of about $4.5 billion. So out of the total $16 billion need, to get even those that are in process completed, is going to take a number of years at the present Federal grant levels.

Ms. FERRARO. So that the $16 billion is really a long-term goal.

Mr. MARSH. That is the long-term goal. That is the total needs under USEPA's needs survey.

Ms. FERRARO. I just wanted to ask you to give us a statement on PCB's. We are going to have testimony from the city with reference to it. It has been several years since the Congress turned its attention to the problem of PCB's in the Hudson River. We directed the

EPA to get on with the job of removing the worst hot spots, and I have discussed that.

Today we have seen very little progress.

In view of this, what is New York State's strategy for dealing with the PCB problem?

Mr. MARSH. Well, our twofold funding strategy is to obtain the funds that were authorized by Congress, specifically for the PCB dredging pilot project in the Hudson River of which about $18.3 million are now being withheld by EPA. We have a lawsuit against EPA to try to release those funds, as you know. But if we do not receive some results in that suit by the end of next week, we are going to have to ask EPA to reprogram the money to other needs or we would lose it.

EPA has put the PCB project on the Superfund list, which indicates that some of it may be available for the future. Our plans are in accordance with the studies that have been done to date, to dredge as many of the hot spots of PCB contamination in the river north of Troy as we can afford to do, and to encapsulate as much of that material as we can and perhaps to incinerate the most concentrated parts of it, if we can find a suitable place to do that.

So if we had our druthers, we would be using Clean Water Act funds to do the dredging aspects and the Superfund moneys that might become available to deal with the encapsulation or the destruction of the material that is dredged. Ultimately, we are going to seek supplemental funding to deal with the remainder of the problem, the remainder of the hot spots and some of the remnant deposits and dredge spoil areas, and assess the whole project for its viability as a precedent to do other in-place toxic work. We also have, of course, underway remediation of other PCB dump sites in the area of the Hudson River to prevent that kind of contamination from being released into the river in the future.

We have a problem of providing a site. Our siting board did—this is for the encapsulation of the materials—our siting board did approve a site that is now being held up in State Court. We hope to have that resolved quickly.

Ms. FERRARO. What is the likelihood that you will get a decision from the court by next week in order to fall within the deadline, EPA deadline?

Mr. MARSH. Well, we have two courts involved. One, the decision that we need by next week is from the Federal court to extend the deadline for the obligation of the Clean Water Act funds beyond September 30. That is all we need from the court by next week.

Ms. FERRARO. Is there a likelihood that you would get that decision by next week?

Mr. MARSH. Well, there is a good likelihood we will get the decision. I would not be able to predict how likely success will be.

Ms. FERRARO. Thank you very much. Thank you, Mr. Chairman.

Mr. MOLINARI. Will the gentlelady yield, or the Chairman yield for a question?

Mr. ROE. Yes, of course.

Mr. MOLINARI. On that score, there have been some statements made that if we do not proceed to clean up the PCB hotspots in the Hudson, that the net effect could eventually mean the closing of New York Harbor. Yet it is my understanding that the Administra-

tor of EPA, Mr. Ruckelshaus has made a determination that there is no correlation between the PCB's in the New York Harbor and that which appears in the upper Hudson.

Could you please give us the views of the department on that problem?

Mr. MARSH. Well, we do not believe that there is any question that ultimately the PCB's in the upper Hudson will migrate over the dam, the Federal dam at Troy into the lower Hudson and eventually find their way to New York Harbor. New York Harbor obviously is highly impacted by other sources of pollution, so it is hard to say at the moment how much of the contamination found there is a result of dumping in the upper Hudson.

But the studies, I think, clearly show that there will be a long-term trend which could be exacerbated by heavy water conditions at any time to scour the materials out of the upper Hudson and eventually transport them to the lower Hudson.

Mr. MOLINARI. Will that not disturb though the bottom sediment to the extent that some PCB's would find their way downstream that were resting upon the bottom?

Mr. MARSH. Oh, yes. And that is the danger. One could get very heavy water that has a scouring effect that takes silts right over the top of the dam.

Mr. MOLINARI. You are talking about during a storm?

Mr. MARSH. Yes.

Mr. MOLINARI. I am talking about during the removal process.

Mr. MARSH. I am sorry.

Mr. MOLINARI. During the removal process you are going to be scouring it from the bottom.

Mr. MARSH. That is right.

Mr. MOLINARI. And then disturbing it. I have heard it said, now I am not making the statement myself, but I am just raising the question. Would this not pose a problem in that you are disturbing the PCB's that are laying on the bottom in the removal process and in some quantity it would be wending its way downstream?

Mr. MARSH. Well, no question when you disturb the sediments that there will be some suspension of them in the water column. The way the project is designed, it is supposed to protect the migration of sediments during the actual dredging by a number of means so as to minimize that. And I think that while there is always some tradeoff and some potential problem there, the judgment has been that the amount that you are going to remove from possible future migration is so much greater than the small amounts that would be released during the actual dredging operations, that it is a clear net benefit.

Mr. MOLINARI. Thank you very much. I appreciate it.

Mr. ROE. Let me interject a thought at this point. You are speaking to a need and I think this gets into a little more depth of what the members of the delegation from New York have been asking. You speak of a need of New York State of $16 billion which is a point source pollution. Then you spoke to the issue of nonpoint source.

But do you have any ideas as to what your figure on nonpoint source would be?

Mr. MARSH. Well, no, because we do not have a handle on what it will take to clean up all of the potential nonpoint sources that we have. You have such a variety of potential problem areas. If we just take the inactive hazardous waste landfill sites, for example, we have identified some 700 or so throughout the State, of which a handful are in the Federal Super Fund and 100 or so, I guess at the moment 60 or so are being intensively studied for addition to the Federal list.

Mr. ROE. So—because the time is so desperately short, is your statement then saying the following that the State of New York has not identified the order of magnitude at this moment of what the nonpoint source situation is. Is that a fair commentary?

Mr. MARSH. That is a fair commentary, yes.

Mr. ROE. All right.

Then question No. 2 is: You came back and you said in your original testimony that the relationship of continuing monitoring and in effect expanding the monitoring would help to add to that knowledge. Is that a fair commentary to make?

Mr. MARSH. Yes, it would, although most of the monitoring that I spoke about was of point sources. I also said that I felt we should add to our capability to analyze the problem from the point of view of nonpoint sources as well.

Mr. ROE. Yes.

Well, what I am trying to get at is that we have listened to a lot of testimony and I have been on this for the last 15 years myself, so we listened to testimony and after a while the testimony becomes the given fact rather than the point of what the facts are or the known facts are. All I am trying to ascertain from you is that as of this date now, and I mean no criticism, is that you have not been able to as far as your State level, to identify the order of magnitude of the nonpoint source contamination. Is that a fair commentary?

Mr. MARSH. That is correct. Certainly not on a total basis.

Mr. ROE. So therefore, would you not know whether that is greater. We speak of $16 billion being needed for point source now and we have no idea what the other may be and we know that in many areas is an enormous level of concentration, feedlots and that sort of thing as far as pollution of those rivers and streams is concerned in the first place. So we really have not identified, or for whatever the reason might be at this juncture, what the nonpoint source, time order of magnitude is. Is that a fair commentary to make?

Mr. MARSH. I think so.

Mr. ROE. And should not the committee be directing some intensity of their legislative efforts in that direction?

Mr. MARSH. I should think so.

Mr. ROE. And I am leading to a point.

The second point that I think I want to bring up for the benefit of the committee members is the following. You spoke to the issue of increasing the aggregate funding from the $2.4 billion, I think, what was it, $3.5 billion.

Mr. MARSH. $3.5 billion.

Mr. ROE. And you spoke of $227 million roughly being available to New York State and its political subdivisions in the Federal matching end of it.

Now, the one thing that puzzles me is that we know in view of both the previous administration's and this administration's policy toward segmented projects, that many of those plants are not operating at the capacity they should be operating or really doing what they should be doing because that is all over the country, plants sitting waiting for funding to complete.

I was doing a little calculating when you were testifying on the question. If we are talking about $16 billion being a backlog and then we speak of parts and pieces of plants being completed, no effrontry to New York because it is the same thing in my State, we come to the point of saying, how long is it going to take us? Things are not standing still. We are not dealing with the magic survey needs that have been put out by EPA. EPA has come back to our respective States and has said hey, look, you work with us and tell us what you need, what you see your situation to be over a period of time to get it cleaned up. That is what the needs survey produced.

But the needs survey, to my knowledge, did not have a breakdown in saying that if we are going to get the greatest accomplishment for the immediate funds, these are the projects we would recommend New York State to do. Let us concentrate our funding here. We can clean up 500 million gallons a day in pollution. We are not doing that because the needs survey does not speak to that issue.

What I think would be helpful to the committee, getting to my point, would be if you could come back and take the funding at a level of income coming into New York State now under the $2.4 billion and project that against the needs survey.

So that Congress can make that decision if it wants the $2.4 billion and takes 80 years to do it, maybe we would never get anything done. We could be wasting more money than increasing that allocation and shortening that period of time.

And I think that is what the gentlelady specifically is speaking to from New York. Or are we just saying to the American people, are we lulled into needs surveys, more monitoring. Are we bleeding to death? That is the issue.

So could you be enormously helpful? And I would like you to do that for us, say that as a request of you today, that you would submit supplemental testimony. If we were to take the given situation as it is now and project our needs out over that $16 billion, that would give us some idea as to the kind of problem you are faced with. And I think we need that to fortify the testimony presented.

Let me conclude on one other point before I call on the gentleman from California.

The PCB issue is another phenomena that is just floating around and we have had all kinds of meetings with Senators, Members of the House, with the EPA and the whole bit. And they just cannot seem to get a handle on the thing. You know, conflict between the Superfund, conflict between EPA and decisionmaking process, particularly if we are coming back and letting people negate water quality standards as you were speaking to earlier, as far as my State and your State dumping added pollutants into that river and that bay.

So someplace along the line I do not see any testimony so far and I know we are going to hear from New York City, I do not see any real hope of anything moving on PCB's. I really do not see it. And here it is a major, major problem and there does not seem to be any exigency about it. It is not a crash program.

Should it be isolated into its own—should the Congress come back and add an amendment to this legislation or appropriate legislation to say that the PCB problem in the Hudson River, Hudson Bay is of major national importance and we ought to be working with that as a major important national problem rather than the frittering and diddling that we are doing now, if you will pardon my euphemism. What is your thought on that?

Mr. MARSH. On that last point, we feel very strongly that Congress should make that determination. We thought it was a very clear one.

Mr. ROE. But they did not provide the money to do it.

Mr. MARSH. Well, they provided the $20 million under 116.

Mr. ROE. Do you think that is going to clean it up for $20 million? What is your estimate for cleaning it?

Mr. MARSH. It was an adequate start. We think it is probably going to take several times that.

Mr. ROE. Does anybody know? Is there any study that has been made that could say to Congress we need $150 million to clean that up?

Mr. MARSH. I believe we could provide that figure. I do not have it at this time and I would be happy to provide the other time level——

Mr. ROE. That would be of enormous help to us because we are going to have to justify that.

Mr. MARSH. Yes; I think that is a good idea. Thank you.

[The following was received from Mr. Marsh for the record:]

APPENDIX 1—CONSTRUCTION GRANTS NEEDS

1. TEXT

In response to the question of how long it will take New York to meet its construction grants needs based upon its share of the current level of spending, assuming there will be no inflation and that 20 percent of each allocation will be available for "ineligible" categories, we project that the "eligible" needs category of approximately $4.5 billion will be met by the year 2000. This does not include a projection for currently ineligible needs which total an additional $11.7 billion. At the same rate of funding those needs would not be met until approximately 2060, again assuming no additional inflation. The rationale for this projection is attached.

2. ADDITIONAL RATIONALE FOR CONSTRUCTION GRANTS NEEDS PROTECTION

The $16.1 billion reflected on the 1982 Needs Survey should be broken down into two categories: the $4,966.0 million that would be eligible for Federal grants after 1984 and the $11,154.0 million that would not be eligible unless the Governor sets aside 20 percent of the State's allocation for such projects. In order to determine the balance of these two categories on October 1, 1984, the following analysis was performed:

[In millions of dollars]

	1984 eligible	1984 ineligible
1982 needs survey	4,966.0	11,154.0
Less reduction due to 1982 grants	−207.4	−102.1
Subtotal	4,758.6	11,051.9
Plus 1982 inflation (3.5 percent)	+166.5	+386.8
Estimated Oct. 1, 1982	4,925.1	11,438.7
Less reduction due to 1983 grants	−541.7	−135.6
Subtotal	4,383.4	11,303.1
Plus 1983 inflation (3.5 percent)	+153.4	+395.6
Estimated Oct. 1, 1983	4,536.8	11,698.7
Less reduction due to estimated 1982 grants	−257.6	−85.5
Subtotal	4,279.2	11,613.2
Plus estimated 1984 inflation (3.5 percent)	+149.8	+406.5
Estimated Oct. 1, 1984	4,429.0	12,019.7

As of October 1, 1984, two scenarios are possible: either a 20 percent Governor's set aside or else all Federal funds used for the ordinary eligible projects. These two possibilities have been treated separately on the following two pages. Assumptions are that NYS will continue to receive an annual allocation of $271 million of which 15 percent will be used for reserves leaving $230.4 million to reduce needs. For Federal fiscal year's 1985, 1986 and 1987, 80 percent of projects in the eligible category would be "grandfathered" at the 75 percent Federal grant and 20 percent would receive 55 percent. In the following years, only 60 percent of the projects would be grandfathered at 75 percent. All projects funded from a set aside would be at the 55 percent level. No inflation has been factored in after October 1, 1984.

GOVERNOR SET-ASIDE 20 PERCENT FOR OTHERWISE INELIGIBLE PROJECTS

[In millions of dollars]

	1984 eligible needs		1984 ineligible needs	
	Grant reduction	Cumulative ending balance	Grant reduction	Cumulative ending balance
Oct. 1, 1984		4,429.0		12,019.7
Fiscal year:				
1985	259.6	4,169.4	84	11,935.7
1986	259.6	3,909.8	84	11,851.7
1987	259.6	3,650.2	84	11,767.7

Appendix 2—Hudson River PCB Cleanup Costs

TEXT

In regard to the PCB Reclamation and Demonstration Project for the Hudson River, it is estimated that total cost for planned work will approximate $50 million in 1980 dollars. The work included is comprised of three components:

(1) The dredging of 40 in-river hot spots containing 170,000 pounds of p.c.b.

(2) The removal and encapsulation of the remnant deposit area from the former Fort Edward Dam; the approximate quantity of PCBs is 45,000 pounds.

(3) The remediation of New York State dredge spoil sites which contain approximately 70,000 pounds p.c.b.

Appendix 3—Estimated Costs of Implementing Nonpoint Source Controls

TEXT

The New York State 208 studies produced no reliable cost estimates of implementing nonpoint source controls for agricultural or silvacultural runoff, storm sewers, etc.; nor to our knowledge does anyone else have reliable figures. It is expected, however, that costs would reach billions of dollars, and that at present, any program results would be hard to document.

Remediation is probably not feasible, although a closer look at preventive approaches might be helpful. Specifically, we would welcome monies for selected Best Management Practices in high problem areas, and for work closely related to our agricultural resources, such as Cooperative Extension, Soil Conservation Service/State Programs, etc.

The needs are so large that monies to address these issues should not detract from current point source and construction management programs, nor possibly from developing aggressive toxic discharge efforts.

Mr. Roe. The gentleman from California.

Mr. Packard. Thank you, Mr. Chairman.

Being down the line a little bit, some of the same questions that I have concern about have been asked, but I would like to enlarge upon them just briefly.

Did I understand it correctly that the matching formula is 75/25, 75 Federal funding and 25 local?

Mr. Marsh. As of now. That would drop back to 55 percent a year from now.

Mr. Packard. Has the State of New York been able to keep pace with their commitment toward that funding formula?

Mr. MARSH. Do you mean have we been able to spend the funds that have been allocated to us?

Mr. PACKARD. No; have you appropriated your local shares to match the Federal shares as they have become available?

Mr. MARSH. Yes; we have a State Bond Act and local governments have to be able to provide their share in order to get a grant.

Mr. PACKARD. In other words, the Federal funding is conditioned upon the matching funds being available?

Mr. MARSH. That is correct.

Mr. PACKARD. You stress in your report that the availability of Federal funding ought to be based upon needs. In my mind that creates a little bit of a dilemma because there are two ways to mitigate the problem.

One is to increase the funding that would be used for clean up purposes but the other is to do a more thorough and complete job of enforcement and monitoring.

You can just put more and more money into it but if you do not get to the source of the problem then you have an unending need and you never can mitigate the need. The chairman really, in his last few comments, stressed the concerns that I have.

Has the State of New York done any studies to determine those projects which would go the furtherest toward meeting the EPA standards? Have you categorized them in terms of their greatest need and then determined whether that is where the concentrated dollars are to go in preference to spreading it around to the multitude of projects?

Mr. MARSH. Well, each year we produce a priority list of projects that ought to get the first Federal dollars that are available and each year we go through a public process to establish that list. And I will not say—I will not guarantee you that it does exactly what you suggest, because part of the criterion for—of getting on the list—is readiness to go. And that means there are some projects which are not ready to go which may in terms of the water quality improvement need perhaps score higher but yes, we do have the priority list that we come up with every year and we are developing a basin-by-basin survey of what our major water quality problem areas are and the sources of those problems so that we will have a better handle in terms of exactly what sources need to be cleaned up first in order to make the most dramatic and immediate improvement in the water quality situation.

Mr. PACKARD. I think you understand the point, that is if there is $2.4 billion Federal dollars available throughout the country, New York would be eligible for certain percentage of these dollars, that those dollars ought to go to those projects that would be the most cost effective in terms of mitigating the problem.

The second point. Has the State of New York done any studies to identify those industries or those sources of pollution that create or contribute the greatest toward pollution and then what have you done in terms of enforcement and monitoring those sources of pollution? Have you developed a strategy to approach it from the other side of the coin, that I have already mentioned, that is the enforcement and mitigating requirements?

Mr. MARSH. Yes; we have categorized all of our industrial discharges into essentially major and minor sources and we have targeted the most important contributors to our pollution problem for the most intensive effort in setting effluent limits and in surveillance and monitoring activities. We will again be using that survey, basin-by-basin survey that I mentioned, to identify on a water quality basis, and to further refine that list to make sure that we are getting at the most significant discharges.

Mr. PACKARD. Does the State depend on Federal guidelines to enforce or do they have their own additional guidelines?

Mr. MARSH. Well, the problem that I alluded to in my testimony is at the moment we are now faced with having to establish our own limitations on key constituents, particularly the toxic ones in industrial discharges, that so-called best professional judgment. We do that based on a variety of inputs of health and environmental data.

What we would like to be doing more of is operating under more definite Federal guidelines and effluent limit data that would enable us to set the limits with a great deal more efficiency and again with equity throughout the country.

Mr. PACKARD. I think you get the gist of what I am pointing out and that is I would hope the States individually would take the initiative to seek for solutions without simply looking to the Federal Government for either funding or for regulatory procedures in terms of the enforcement aspect of the States. They have a problem and obviously that means we have a problem too. But the solution is not wholly here.

Mr. MARSH. I agree with that.

Mr. PACKARD. The solution is at your level.

Thank you very much.

Mr. ROE. The gentleman from Pennsylvania, Mr. Clinger. I am sorry I bypassed you.

Mr. CLINGER. Thank you very much, Mr. Chairman. Thank you Mr. Marsh for your very constructive testimony. I was particularly struck by the points you make with regard to the bias, if you will, in the existing legislation. That is bias in favor of new construction and in favor of creation of new facilities, which is, I guess, implicit in the fact that we remove certain activities from eligibility for funding under the Federal law. Clearly there is a regional implication here because the older parts of the country have much greater problems in terms of rehabilitation and sewer overflow and those kinds of problems, and perhaps less of a need for major new construction.

However, you should note that whereas these activities have been removed for Federal funding eligibility, there is the option within the Governors' hands to use a portion of the funds for those purposes. I guess my question is: Why do you feel the set-asides that are provided for in the law are not adequate to address the problem? Why would the set-asides not provide the States with the flexibility necessary to address those problems of rehabilitation? I think you said $3.8 billion of your $16 billion was in the area of rehabilitation and another $3 or $4 billion was in the area of sewer overflows. Why are not the set-asides adequate to address those?

Mr. MARSH. Well, I think the amount of the set-aside is too small to enable the full needs to be addressed and I think there is also a signal that is given by providing a lesser importance for those types of facilities that indicate that, you know, the construction of sewage treatment plants are of greater priority.

Mr. CLINGER. These are poor relatives, in effect, that is given the emphasis?

Mr. MARSH. That is right

I think it would be useful both to either increase or abolish the set-aside limits and to provide the clear signal that infrastructural kinds of remedies are of equal importance to others.

Mr. CLINGER. Well, thank you. I agree with you on that point.

But you have indicated also that under the existing law the State's share or the State and local share will increase fairly dramatically in 1985, I believe it is. What is the State of New York doing to prepare for that additional assumption of responsibility?

Mr. MARSH. Well, two things. One is that we are helping those communities along that are trying to get in under the gun so as to be eligible for the 75-percent funding. The other is we are pursuing legislative options in the State of New York to increase the State's share.

Mr. CLINGER. Let me interrupt. Your share now is taken care of through bonding authority?

Mr. MARSH. That is correct.

Mr. CLINGER. And you are proposing to increase that bonding authority?

Mr. MARSH. No. At the present time the bonding authority will be available through the end of this decade, essentially, even if the new projects drop back to the 55-percent level.

But what we are contemplating is reorienting the funds within the Bond Act so as not to increase the local share dramatically from what it is today, because we feel that the severest funding constraints are at the local level and to increase the local share from 12.5 percent to essentially 30 percent would be much too great a jump and we would not be able to get priority projects moving.

Obviously it would be nice to continue the 75-percent share but if that is not possible, we are going to take some action to help our localities out.

Mr. CLINGER. Just one final question. You have indicated that a cause of some frustration for the State of New York is EPA's failure to meet statutory deadlines for establishing effluent compliance standards and that this has caused you significant problems and perhaps long range, even more significant problems that you are attempting to do something in these areas. Whereas other States are perhaps just sitting back waiting for EPA effluent standards.

What kind of input does the State of New York have in the establishment of those standards? Are you involved with EPA in fashioning those standards?

Mr. MARSH. Well, the process for setting effluent guidelines by EPA is a reasonably open one and we have participated both in a technical level and commenting on proposed standards as they come out in the Federal Register.

20-955 O—84——26

Mr. CLINGER. And you feel that your input has been used in the establishment of these standards?

Mr. MARSH. By and large, yes. I think we are—we do not feel that we are equipped to do the same sophisticated level of analysis that is capable of being done at the Federal level to come up with these guidelines. But yes, I think by and large we have been satisfied with the results in those areas where they have come out.

Mr. CLINGER. Thank you very much. Thank you, Mr. Chairman.

Mr. ROE. Are there any further questions for the gentleman from New York?

The gentleman from Minnesota, did you have another question?

Mr. STANGELAND. Well, just one quick one that I think might be worthwhile to have for the record.

You mentioned that you are in the process of getting a groundwater program off the ground. Could you expand on that a little further? What are your groundwater program plans?

Mr. MARSH. We have several identified ground-water problem areas: Long Island being far and away the most important one because it is the sole source aquifer for 2.5 million people. We have some Upstate aquifers that are also under stress. What we have done is to prepare or are in the process of preparing management strategies for both the Long Island aquifer and the upstate areas. And these will include both intensifying monitoring and enforcement efforts and also identification and analysis of potential sources of impacts on the groundwater and consideration of land use controls and other nonstructural measures to deal with the problems that come up.

The Long Island strategy is just about complete in draft form and we will be looking at that and trying to get support from local governments and to the extent possible, from State and Federal resources to do—to go further with it.

We are planning to identify all of the major aquifers in the State, do mapping, to identify potential sources of contamination, existing or potential, and come up with strategies to deal with them on a preventive basis, because we feel that we have tremendous resources there that are on the tipping level right now, it could go either way.

Mr. STANGELAND. I think we would be very interested in getting those strategies when they are developed, when the plans are finalized it might be enlightening and helpful to us.

Mr. MARSH. It certainly would.

[The following was received from Mr. March for the record.]

APPENDIX 4—LONG ISLAND GROUNDWATER STRATEGY

COMMENT

At the present time, the Long Island Groundwater Strategy is undergoing technical review and is not ready to be released. As I indicated in my testimony, we will send you a copy of these strategies when they become available. I expect to be able to deliver a review draft by the first of November.

Mr. ROE. No further questions, we want to thank you very much Commissioner Marsh for being with us this morning and would really appreciate that economic analysis. It does not have to be in

great depth. I am just curious to see what the timeframe is. So we thank you very much.

Mr. MARSH. Thank you. I appreciate the opportunity again. The committee does great work.

Mr. ROE. The next witness is representing the city of New York and I would ask them both to come up together, Mr. Allan M. Tumolillo, who is the assistant commissioner, department of ports and terminals, representing on behalf of Ms. Susan Frank who is a commissioner, together with Mr. Joseph T. McGough, Jr., who is a commissioner of the department of environmental protection in the great State of New York.

We want to welcome you this morning and obvicusly you can see there is a great interest in what New York is doing.

The full text of your prepared statement will appear in the record at this point.

[Statements referred to follow:]

TESTIMONY BY SUSAN FRANK, COMMISSIONER, N.Y.C. DEPARTMENT OF PORTS AND TERMINALS

Good morning, Mr. Chairman and members of the Committee. My name is Susan Frank, and I am Commissioner of the New York City Department of Ports and Terminals. I assumed that position very recently, on August 1st of this year, and this is my first opportunity to meet many of the members of this committee. The occasion is an important one, because the reauthorization of the Clean Water Act is a vital matter for New York City, and one which I urge you to support.

One of New York's greatest natural resources is its waterfront, which played an important role in making the city one of the great commercial centers of the world. The improvements in water quality in recent years that have been achieved because of programs funded by the Clean Water Act have been of enormous benefit to the thousands of New Yorkers and others who use our waterways for commercial or recreational purposes.

The dominant waterway in New York is, of course, the Hudson River, and the effort to improve its water quality depends upon the reauthorization of the Clean Water Act. In particular, I want to focus your attention on the proposed removal of PCBs from the Hudson.

The Hudson River has been severely by the discharge of PCBs, which are suspected of causing birth defects and other serious illnesses in humans, and are suspected carcinogens. PCB contamination of the Hudson was officially recognized as a problem by the federal government in 1975, when fish samples analyzed by the Environmental Protection Agency and the Fish and Wildlife Service revealed PCB concentrations far greater than permissible levels. Further research by the New York State Department of Environmental Conservation has documented the presence of approximately 630,000 pounds of PCB contaminating the bottom sediments of the Hudson River, with 5,000 pounds being carried down to the lower river estuary each year. Forty sites have been identified where PCB deposits in the riverbed sediments contain at least 50 parts per million of PCBs. These 40 so called "hot spots" contain close to 50 percent of the total PCB contamination in the upper Hudson.

This extensive contamination has had a devastating effect on New Yorkers' ability to use and enjoy the Hudson. With PCB levels in some fish exceeding 100 times the FDA's acceptable limits, the State of New York has had to prohibit all commercial and recreational fishing in the upper Hudson and most commercial fishing in the lower Hudson. The accumulation of PCBs in the Port of New York caused the United States Army Corps of Engineers to suspend for a time the issuance of dredging permits for maintenance of adequate harbor depth. The issuance of permits resumed after the Corps, EPA, and local authorities were able to devise a unique process called the "interim guidance martix" to evaluate applications. As contamination increases, it is not likely that the matrix can remain in effect indefinitely. While maintenance dredging has resumed, the continuing accumulation of PCBs creates the risk of closing part or all of the Port of New York.

Any disruption of the Port would have a severe economic impact on the entire region. Maritime commerce in the Port creates 150,000 jobs in the region with an annual payroll of $3 billion and more than $7 billion in sales revenues. These activi-

ties generate over $300 million a year in state and local taxes. The cargo that passed through the Port of New York in 1982 was valued at $42 billion, the highest of any port in the nation. The systoms revenue to the Federal government generated by this commerce exceeds $1 billion.

In 1978, the State proposed a PCB cleanup project in which the hot spots would be dredged and the contaminated deposits would be removed and disposed of in a secure landfill. The material would be encased in clay and closely monitored to control any runoff or leachate until such time as an effective and economical means of destroying PCBs is developed.

In order to assist New York in implementing the cleanup of this serve hazard, the Congress in 1980 amended the Clean Water Act to add Section 116, which provided for funding of the Hudson River Reclamation Project by the Environmental Protection Agency. Congress provided $20 million to help pay for the project and directed the EPA to make the funds available to New York.

The technical merit of the reclamation project was confirmed by EPA's environmental impact statement, which was published in final form in October 1982. EPA concluded that the dredging and landfill containment of PCBs was the environmentally preferable solution to the problem. Despite these findings, the Environmental Protection Administrator announced in December 1982 that funding would not be provided under Section 116 because of the desirability of allocating funds from the so-called Superfund.

It is clear that this approach will not allow us to move quickly to resolve this urgent problem. The Superfund must somehow deal with 17,000 hazardous waste sites throughout the country that require remedial action. EPA officials have said that their high-priority list may ultimately exceed 1,000 sites. The Hudson River was only added to that list on September 1st, and must compete for allocations from the Superfund with the 545 other sites that have been listed.

EPA's decision has created nearly a year's delay in implementing the Hudson River cleanup, and that delay continues. Not only has this allowed the contamination of the lower Hudson to continue unchecked, but the value of the unspent funds is dissipated as time goes on and costs increase. Prompt action is necessary if we are to obtain full value from the allocated funds.

This situation is completely unnecessary, and would be resolved quickly if EPA would comply with the clear intent of the Congress and release the funds authorized by Section 116 of the Clean Water Act. A broad range of public officials and concerned citizens, including the New York and New Jersey Congressional delegation and several members of this committee, have publicly urged the EPA Administrator to do so. Two lawsuits have been filed to require EPA to release the funds, one by the State of New York and another by four major environmental organizations, the Hudson River Sloop Clearwater, Scenic Hudson Incorporated, the Natural Resources Defense Council, and the Hudson River Fishermens Association. The lawsuits have been endorsed by Save Our Port, a coalition of business, labor and governmental groups in the Port of New York and New Jersey.

Another option that would accomplish the same purpose of immediate implementation of the Hudson River Reclamation Project would be immediate action by EPA to allocate equivalent funds from the Superfund, eliminating time-consuming procedural delays. We in New York defer to the Congress in determining which procedure is preferable. The important issue is to end the delay and move ahead with this crucial cleanup program.

We appreciate the actions taken by members of this committee to obtain prompt action by the Environmental Protection Agency. I strongly urge your taking action that will enable us to eliminate this extreme hazard from one of America's great waterways.

New York City has developed a number of major programs in recent years to revive maritime commerce and revitalize the waterfront for new recreational and commercial activities. The elimination of a serious pollution problem in the Hudson River will be a great step forward in restoring this great natural resource for public use. We in New York appreciate the support of this committee and the Congress in achieving this goal.

STATEMENT OF JOSEPH T. MCGOUGH, JR. COMMISSIONER, DEPARTMENT OF ENVIRONMENTAL PROTECTION, CITY OF NEW YORK

Mr. Chairman and Members of the Subcommitee, I am Joseph T. McGough, Jr., Commissioner of the New York City Department of Environmental Protection. I

would like to thank you for the opportunity to testify before you today on possible amendments to the Federal Water Pollution Control Act.

I am going to address my remarks today to two issues which are currently before the Committee in considering the Act: the level of funding for construction grants, and the 301(h) variance from secondary treatment requirements for sewage treatment plants discharging into marine waters. Both of these have an enormous, direct impact on the City of New York, and they are closely related.

The Federal Water Pollution Control Act Amendments of 1972 required a nationwide, uniform minimum level of secondary treatment for all municipal wastewater treatment plants. In many instances, this level would not be adequate to meet local water quality requirements; and in some instances, perhaps it would be more than is necessary. But it was felt that a uniform minimum of treatment should be required partly because of a quite legitimate skepticism about how accurately water quality based requirements could be calculated. To help cities comply with this requirement, a massive grants program was initiated as the municipal component of a crash program to restore the integrity of the nation's waters.

We all support this goal and there is also almost universal support for the basic regulatory approach set forth in the Act. One result of this approach to secondary treatment, however, is that some misallocation of funds has resulted. In a crash program a certain amount of haphazardness is to be expected: what we want is results. While other aspects of a water pollution control system were grant eligible, secondary treatment was the basic legal mandate. Thus, it was possible to fund infiltration and inflow correction, or combined sewer overflow abatement, or to build or rehabilitate sewer systems, but there was nonetheless a bias in the system for completing the treatment plants.

Ten years have now elapsed since the enactment of Public Law 92-500. Much progress has been made; thousands of treatment plants are in the process of being upgraded throughout the country. Over $30 billion in federal funds have been invested. But we have a very long way to go before the secondary treatment requirement, first mandated for 1977, can be complied with nationwide. In the meantime, construction grant funds are decreasing. It is surely not necessary to recount to Members of this Subcommittee the story of this Administration's successful effort to decrease the Federal commitment to this program to its current level of $2.4 billion.

In a world of diminishing resources, it becomes painfully obvious that requirements and dollars go hand in hand. We are not, however, advocating any change in the basic requirements for municipal treatment in the current law. We advocate that every dollar spend be in the most effective manner. In order to achieve that, we strongly support a flexible grants program which allows the most effective steps to be taken on a system-wide basis to clean up and maintain the water quality of the water body in question. This program should include a limited variance for discharges into marine waters, which can help insure that limited water pollution control dollars can be spend in the way that produces the greatest water quality benefits.

We noted with approval the increased funding for construction grants contained in Chairman Howard's bill, H.R. 3282. Funding under the construction grants program is crucial to the City's effort to comply with the Act's mandates for sewage treatment. The City is currently operating under a consent decree governing the construction of two treatment plants, North River and Red Hook, which, when constructed to full secondary treatment, will represent a total investment of $1.5 billion.

For years, the City faced the problem of the deteriorating condition of the Coney Island and Owl's Head plants, both of which were in dire need of immediate, short-term remedial attention to prevent breakdown in the treatment process that could affect 200,000 homes and bathing beaches. During this past year the City has begun the process of upgrading and rehabilitating these two plants.

Again, if this nationwide commitment to secondary treatment is to be achieved, continued and increased funding under the construction grants program is absolutely essential, not just for the City but also for the thousands of communities which are still hoping to begin construction on needed improvements.

This brings us to 301(h). It was in 1977 that Congress for the first time embraced the concept that it might be possible to identify areas where scarce water pollution control dollars could be saved and more effectively spent in other ways than complying with the uniform secondary treatment requirement. This was not a blanket endorsement of the water quality based approach to water pollution control. Rather, it was an attempt to single out the one instance where it is the most clear that under certain circumstances the millions of dollars of public investment in secondary treatment can in fact produce little or no benefits in water quality. (This is not to

say that there are not others.) To insure that this instance would be narrowly drawn, it was circumscribed by a number of very stringent requirements. It is worth restating these limitations to recall just how stringent the provision is: To obtain an ocean discharge variance, the applicant has the burden of showing that:

(1) there is an applicable water quality standard specific to the pollutant for which the modification is requested;

(2) such modified requirements will not interfere with the attainment or maintenance of that water quality which assures the protection of public water supplies and the protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife, and allows recreation activities, in and on the water;

(3) the applicant has established a biomonitoring system;

(4) the modified requirements will not result in any additional requirements on any other point or nonpoint source;

(5) all applicable pretreatment requirements will be enforced;

(6) to the extent practicable, the applicant has a program to eliminate the entrance of toxics from nonindustrial sources into the treatment works;

(7) there will be no new or substantially increased discharges from the plant of the pollutants above the levels specified in the modified permit; and

(8) any construction grant funds will be used either to meet the above requirements or provide the best practicable waste treatment technology.

The variance was to be available only to those communities with existing outfalls in 1977, discharging into marine waters, defined as discharges into "deep waters of the territorial sea or the waters of the contiguous zone, or into saline estuarine waters where there is strong tidal movement and other hydrological and geological characteristics which the Administrator determines necessary to allow compliance" with the second of the above showings. In addition, to make the variance even more limited, a strict time limit was included.

In 1981, as this Committee acted to reauthorize the construction grants program, the Committee endorsed the marine discharge variance. After receiving extensive testimony, and considering similar efforts of the Investigations and Oversight Subcommittee, the Water Resources Subcommittee approved amendments to section 301(h) which eliminated the deadline on applications, eliminated the limitation to communities with ocean outfalls in existence in 1977, allowed States to delegate the authority to make 301(h) determinations and deleted paragraph 301(h)(8) relating to best practicable waste treatment technology. In the full Committee, delegation of variance authority was withdrawn, but a provision was added allowing communities currently achieving secondary treatment to apply for the variance. In its report (H.R. Rept. 97-270) the Committee stated:

"Engineering advances have been made in recent years which have led to improvements in outfall design achieving rapid dilution, in the ability to predict the dispersal patterns of outfall discharges, and in monitoring capability to analyze environmental effects. In addition, there have been continuing increases in capital costs to achieve full secondary treatment, reduction in Federal funding levels, and rising operating costs. In view of these factors, and in order to achieve needed savings in the cost of treatment of municipal wastes, the Committee considers it desirable to make the option of ocean discharges available where it can be shown that unacceptable adverse environmental effects will not result."

Under the provisions of 301(h) as put into the law by this Committee, the City of New York has applied for variances for six of its plants. Four of the City's applications affect plants now in operation: the Newtown Creek facility and the Bowery Bay, Hunts Point and Walds Island plants. The latter three are currently providing full secondary treatment year round. We propose to continue full secondary treatment at those three plants during the summer months and provide primary treatment during the winter months (November to May) when the cool waters surrounding the City naturally absorb and hold more oxygen to meet the needs of indigenous marine life. The application for the Newtown Creek facility proposes a 70 percent removal rate for this facility year round rather than the 85 percent removal required under EPA's current definition of secondary treatment. The remaining two applications are for Red Hook and North River. For North River, the City proposes full secondary treatment for half the flow during the summer months and primary treatment for the other half of the effluent. This would result in a 50 to 55 percent removal rate during the summer months. During the winter, the plant would operate at primary treatment. For Red Hook, the City proposes to build and operate the plant at primary treatment year round. Through these measures, over $450 million in construction costs and several million a year in operating costs could be devoted to water pollution control measures which clearly have greater benefits. These applications are currently undergoing scientific review and revision under the provi-

sions of the Environmental Protection Agency's regulations. At this time, the main issue is a scientific one having to to with modelling the water quality impacts of discharges into the water in the area and the compliance with water quality standards. We feel that this is a proper defensible, scientific decisionmaking process and that it ought to continue. We intend to abide by the outcome.

In general, we are now in a time when environmental laws, which were written in the most admirably sweeping and idealistic terms, are being and must be scrutinized to determine where limited public resources can obtain the most pollution reduction benefits. This is a difficult process. Every time a way is found of directing funds from dubious to more urgent purposes, the effort will be open to the charge of backing off from the original goals of the Act, and allowing dirtier water—for example, by allowing less than secondary treatment. But we, as public officials, now live in a more complicated world of limited resources where difficult choices must be made.

I would now like to address some of the specific provisions included in the Howard bill, H.R. 3282.

DISCHARGE INTO ESTUARINE WATERS

The provision of most concern to us is the amendment eliminating the application for a variance for discharge into saline estuarine waters where there is a strong tidal flow. This prohibition will eliminate a category of applicants from consideration without regard to the water quality conditions in the specific location. We believe that each case should be examined individually and a decision on whether to grant a variance should be based on the extensive scientific evidence submitted by each applicant pursuant to the strict standards set by the law. If an applicant demonstrates that water quality would not be adversely affected by the modified requirement, then no justification exists for eliminating the possibility of a waiver for estuarine waters. We could, however, support the language included in the Senate bill which states "such marine waters must exhibit characteristics assuring that water providing dilution does not contain significant amounts of previously discharged effluent from such treatment works".

PRIMARY TREATMENT

The bill also requires that a treatment plant provide at least primary treatment including screening, sedimentation, skimming and chemical treatment to control pathogens. We endorse this proposal but suggest that chemical disinfection be required only when appropriate.

MARINE WATER QUALITY CRITERIA

Paragraph (c) of Section 5 of H.R. 3282, in addition to requiring primary treatment, also requires a showing that the effluent "meets the criteria established under section 304(a)(1) after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged." The intent of this provision is not clear. Water quality standards under the existing program apply to specific pollutants, not to effluent streams. Where POTW effluents contain pollutants of concern, these may be regulated through state water quality standards which are established using the federal Environmental Protection Agency's water quality criteria documents as guidance. Some of this guidance does contain information on the effects of pollutants on saltwater aquatic life and we would support additional research in this area. EPA is also developing guidance on adjusting water quality criteria to reflect local conditions; and unlike other portions of EPA's proposed revisions to water quality standards, that initiative has received widespread support from Congress and the public. We support use of water quality criteria in this way, and we do not take the proposed amendment as suggesting that existing or future guidance on saltwater criteria for the protection of marine life be given automatic regulatory force. As such, the proposed amendment is consistent with the existing provision of section 301(h)(1) and we would request clarification if there is intended to be any other impact.

CUMULATIVE EFFECTS

Another provision of concern to us is the requirement that the cumulative effects of possible variances be considered as a condition to the grant of a variance. This is a valid concern but one which will be difficult to administer. However, the provisions of H.R. 3282 relating to interstate management conferences for estuaries might be a more proper vehicle for consideration of the effects of applications upon

a particular body of water. Additionally, section 301(h)(4) now requires that a variance not result in any additional requirements on any other point or nonpoint source and therefore implicitly deals with this issue. Finally, the requirement that all treatment plants receiving a variance provide a minimum of primary treatment is a valid step in addressing the concern of cumulative effects of variances.

REMOVAL OF TOXICS

Finally, the provision requiring removal of toxics at the same levels as that provided by secondary treatment and the entire question of removal levels for toxics is one which is of concern to us. It is a complex issue which must be addressed in a rational manner. Mandating that removal of toxics be at the same level as now provided by secondary treatment does not address the real question of determining what level of each toxic pollutant is permissible, which should be accomplished by specifically setting standards for each pollutant.

In summary, we believe that the regulatory process should be permitted to proceed. A variance from the requirement for secondary treatment is for a five year period only, at which time a re-evaluation can occur. In addition to the limited time period, extensive monitoring is required in order to determine the effects on water quality during the life of the variance. This mechanism for continued evaluation of 301(h) waivers will address many of the concerns expressed about the program.

I would like to thank the members of the committee for the opportunity to present our views.

Mr. ROE. Please proceed.

TESTIMONY OF ALLAN M. TUMOLILLO, ASSISTANT COMMISSIONER OF PORTS AND TERMINALS, CITY OF NEW YORK, ACCOMPANIED BY JOSEPH T. McGOUGH, JR., COMMISSIONER, DEPARTMENT OF ENVIRONMENTAL PROTECTION, CITY OF NEW YORK

Mr. TUMOLILLO. Thank you, Mr. Chairman. It is a pleasure to be here today. Some reference has already been made to the Hudson River reclamation project, the PCB problem that we have in New York State and New York City. I would just summarize some of the elements of the background on that and get into our proposals.

The Hudson River, as some of you well know, has been polluted by the PCB's that have been deposited in the river in upstate New York, near Troy, N.Y. This contamination has led to many problems in the lower bay, the denial of dredging permits as well as problems in the river to the commercial fisheries operation up there, and if either of those activities were suspended it would cause grave economic damage to the State and City of New York.

The EPA and the Fish and Wildlife Service have determined that the PCB contamination in the river and in the bay exceeds the permissible levels. In New York State, the Department of Environmental Conservation initiated the Hudson River reclamation project with State funds and funds collected from the General Electric Corp., one of the companies that has contributed to the pollution.

The program envisioned removing 40 of the hot spots, the most concentrated hot spots of PCB's in the Hudson River. These are the hot spots that when there is the high flow of water down the Hudson, the sediments are carried over the dam down into the lower bay and some are deposited on the slips and berths of New York Harbor, thus leading to permit problems. In 1978, 1979 and 1980, the Army Corps of Engineers in New York, the lead agency for issuing permits, got to the point of rejecting virtually all permits applied for that year due to the PCB contamination. Obviously not all the PCB's in the harbor come from the Hudson River,

although some portion does come from them and is the most concentrated source. Some additional sources are runoff from the streets and so on.

The pressure from court interests, labor, and concerned citizens to keep the port open because of its tremendous economic benefits to the region led to what was called an interim guidance matrix, a technical formula by which permits could be accepted or rejected and some remedial action taken in protecting the ocean where most of the dredged material would be taken.

Since that time, there has been, as you mentioned, no action taken on the PCB cleanup. Two environmental impact statements have been completed, one by the State of New York and one by the Environmental Protection Agency, both recommending going forward with the project.

Congress in 1980 very clearly stated its intent that the river should be cleaned up, recommended the use of the $20 million under section 116 to fund that program. Admittedly, it is not enough to clean up the entire river as you mentioned earlier, Mr. Chairman, but it is an adequate start and does hit the most important part of that problem.

EPA has taken the tack that Superfund is the route to go. And as you all know, there are hundreds, if not thousands of sites across the United States which are considered eligible for Superfund. And where this would sit in that priority listing, it is not clear. It appears to be far down the list under the Superfund requirements, which would mean that there would be further delays, additional studies to prove that the project should go forward and decide what the scope of the project would be.

The $20 million that was authorized and appropriated has lost value since 1980: it has diminished sharply. We support the State position that the dredging should go forward and that if Superfund were available for this project for the incineration, than that should be looked at immediately.

We do not have detailed legislative proposal to you, we have looked to the Congress to give us guidance. We do wish that the Congress would reiterate its clear intent that the river be cleaned up so that the port of New York and that the commercial fisheries operation in the upper Hudson can continue and the economic benefits of those activities can accrue to the region.

Wheather the reauthorization of section 116 is the preferred route with additional funds coming from the Superfund program or funds are solely out of Superfund, we will be guided by the Congress.

Our main concern is that this project move forward now rather than 5 years from now.

Mr. ROE. Would the gentleman yield on that point?

What you are saying is that somebody has got to make a decision and get it moving. Is that really basically what we are saying.

Mr. TUMOLILLO. Yes.

Mr. ROE. And then apparently it is not going to be made unless Congress makes that decision, is that a reasonable point of view?

Mr. TUMOLILLO. Yes, that is our position.

Mr. ROE. Thank you.

Mr. TUMOLILLO. That is the testimony from my department. I would turn the floor over to Commissioner McGough. If there are any questions.

Mr. ROE. Commissioner McGough.

Mr. MCGOUGH. Yes, I want to thank you for inviting me today and giving me an opportunity to testify on these important issues.

I am going to address my remarks to two primary issues. One is the level of funding, construction grants, and the other is the 301(h) variance from secondary treatment requirements. Both of these are enormously important issues to the City of New York and they are interrelated.

The Federal Water Pollution Control Act amendments of 1972 required a nationwide uniform minimum level of secondary treatment for all municipal waste water treatment plants. In many instances this level would not be adequate to meet local water quality requirements and in some instances it was recognized and perhaps would be required.

Mr. ROE. Would the gentleman pull his microphone a little closer, please.

Mr. MCGOUGH. But it was felt that a uniform minimum standard of treatment nationwide should be required, probably because of a quite legitimate skepticism about how accurately water quality based requirements could be calculated. To help cities comply with this requirement, a massive grants program was initiated as the municipal component of a crash program to restore the integrity of our Nation's waters.

We support this goal and the regulatory approach set forth in that act.

One result of this approach to secondary treatment, however, is that some misallocation of funds has resulted. In a crash program a certain amount of miscalculation is to expected. What is important is swift action.

Ten years have now elapsed since the enactment of Public Law 92-500. Much progress has been made, thousands of treatment plants are in the process of being upgraded and over $30 billion in Federal funds have been invested. But still we have a long way to go before the secondary treatment requirements, first mandated for 1977, can be achieved thoughout the Nation.

Accordingly, we note with approval the increase in funding for construction grants contained in Chairman Howard's bill, H.R. 3282. Funding under the construction grants program is crucial to the city's efforts to comply with the act's mandate. The city is currently constructing two new sewage treatment plants in North River and Red Hook, which when constructed to full secondary treatment, would represent an investment of $1.5 billion.

In addition, the city has begun upgrading the last two plants, Coney Island and Owl's Head to full secondary treatment, bringing to 11 the number of full secondary plants in operation in the city.

Again, if this nationwide commitment to secondary treatment is to be achieved, continued, and increased funding under the construction grants program is absolutely essential not just for the city but also for the thousands of communities throughout the Nation who are still hoping to begin construction of needed improvements.

This brings me to the 301(h) issue which is of course also very important. On this issue we are not advocating any change in the basic structure of the Clean Water Act. What we do advocate is that dollars be spent in the most effective manner. In order to achieve that, we strongly support a flexible grants program which allows the most effective steps to be taken on a systemwide basis to clean up and maintain the water quality of the body of water in question.

This program should include a limited variance from discharges into marine waters which can help to insure that limited water pollution control dollars are spent in the way that produces the greatest water quality benefits.

In 1977, Congress endorsed this concept when it passed the original 301(h) provisions and in that passage it tried to identify that area where scarce water pollution control dollars could be saved and more effectively spent. It did not endorse a blanket water quality based approach to water pollution control problems but rather it was an attempt then to single out the one instance where it was most clear that secondary treatment would in fact produce little or no benefits to water quality. To insure that this instance was narrowly drawn, it was circumscribed by a number of very stringent requirements. They were eight in all at that time, there are seven now and I need not reiterate them here to this committee, which is well aware of them, but indeed they are very, very stringent.

Again in 1981, when this committee acted to reauthorize the construction grants program, the committee endorsed the marine discharge variants. At that time, after receiving extensive testimony, it made some slight amendments to 301(h) eliminating the deadline that had previously been set and permitting communities that has established outfalls after 1977 to apply for the waiver.

It is interesting to note that in its report at that time the committee stated that:

> Engineering advances have been made in recent years which have led to improvements in outfall design achieving rapid dilution, in the ability to predict the dispersal patterns of outfall discharges and in monitoring capability to analyze environmental effects.

In addition, the committee stated:

> There have been continuing increases in capital costs to achieve full secondary treatment, reduction in Federal funding levels, and rising operating costs. In view of these factors, and in order to achieve needed savings in the cost of treatment of municipal wastes, the Committee considers it desirable to make the option of ocean discharges available where it can be shown that unacceptable adverse environmental impacts will not result.

Under the provisions of 301(h) as put into the law by this Committee, the city of New York has applied for six variances. Three of these are for existing plants which are now treating at the secondary level. For these three plants, Bowery Bay, Hunt's Point and Ward's Island, the city is seeking only seasonal variances where it will treat at the secondary level in the summer months and it will treat at the primary level for the winter months when the cool water surrounding the city naturally absorbs and holds more oxygen to meet the needs of indigenous marine life.

The fourth application is for the Newtown Creek facility, the last remaining plant that has not been upgraded to secondary. This

plant is a step aeration plant and currently gives a removal of 70 percent of the pollutants in the effluent. It is our proposal in our application that we continue to leave that plant at its step aeration rate on a year-round basis.

The last two applications are for the North River and Red Hook plants. In the case of North River it is our intention to treat half the flow at the secondary level and the other half of the flow at a primary level during the summer months. During the winter months we would treat all the effluent at the primary level. At Red Hook it is our proposal that we treat at the primary level year round. Through these measures, over $450 million in capital construction costs and several million dollars a year in operating costs could be saved, to be devoted to other water pollution control measures that would benefit New York City and the surrounding communities. These applications are currently undergoing scientific review and revision under the provisions of the Environmental Protection Agency's regulations.

At this time the main issue is a scientific one having to do with modeling the water quality impacts of discharges into the waters in the area and compliance with water quality standards established by the State of New York. We feel that this is a proper defensible, scientific decisionmaking process and that it ought to continue. We intend to abide by its outcome.

In Chairman Howard's bill there are several provisions that I would like to comment specifically on. The first provision, the one that is the most troubling for us is that which relates to estuarine waters. The provisions would prohibit the city of New York actually from, for all intents and purposes, continuing with its applications. This prohibition will eliminate a category of applicants from consideration without regard to the water quality conditions in the specific location.

We believe that each case should be examined individually and a decision on whether to grant a variance should be based on the extensive scientific evidence submitted by each applicant pursuant to the strict standards set forth in the current law. If an applicant demonstrates that water quality would not be adversely affected by the modified requirement, then no justification exists for eliminating the possibility of a waiver for estuarine waters. We could however support the language included in the Senate bill which states:

"Such marine waters must exhibit characteristics assuring that water providing dilution does not contain significant amounts of previously discharged effluent from such treatment works."

As to primary treatment, the bill also requires that a treatment plant provide at least primary treatment including screening, sedimentation, skimming and chemical treatment to control pathogens. We endorse this proposal but suggest that chemical disinfection be required only when appropriate.

Paragraph (c) of section 5 of H.R. 3282, in addition to requiring primary treatment also requires a showing that the effluent "meets the criteria established under section 304(e)(1) after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged." The intent of this provision is not clear. Water quality standards under the existing program apply to specific pollutants, not to effluent streams. Where POWTW ef-

fluents contain pollutants of concern, these may be regulated through State water quality standards which are established using the Federal EPA's water quality criteria documents as guidance.

Some of this guidance does contain information on the effects of pollutants on salt water aquatic life and we would support additional research in this area.

EPA is also developing guidance on adjusting water quality criteria to reflect local conditions. And, unlike other portions of EPA's proposed revisions to water quality standards, that initiative has received widespread support from Congress and the public. We support use of water quality criteria in this way, and we do not take the proposed amendment as suggesting that existing or future guidance on salt water criteria for the protection of marine life be given automatic regulatory force. As such, the proposed amendment is consistent with the existing provision of section 301(h)(1) and we would request clarification if there is intended to be any other impact.

Another provision of concern to us is the requirement that the cumulative effects of possible variances be considered as a condition to the grant of a variance. This is a valid concern bit one which will be difficult to administer. However, the provisions of H.R. 3282 relating to interstate management conferences for estuaries might be a more proper vehicle for consideration of the effects of applications upon a particular body of water. And we would endorse it. Additionally, section 301(h)(4) now required that a variance not result in any additional requirements on any other point or nonpoint source and therefore implicitly deals with this issue.

Finally, the requirement that all treatment plants receiving a variance provide a minimum of primary treatment is a valid step in addressing the concern of cumulative effects of variances. Finally, the subject of toxics. The provisions require removal of toxics at the same levels as that provided by secondary treatment and the entire question of removal levels for toxics is one which is of grave concern to us. It is a complex issue which must be addressed in a rational manner. Mandating that removal of toxics be at the same level as now provided by secondary treatment does not address the real question of determining what level of each toxic pollutant is permissible, which should be accomplished by specifically setting standards for each pollutant.

In summary, we believe that the regulatory process should be permitted to proceed.

A variance from the requirements for secondary treatment is for a 5 year period only, at which time a reevaluation can occur. In addition to the limited time period, extensive monitoring is required in order to determine the effects in water quality during the life of the variants. This mechanism for continued evaluation of 301(h) variances will address many of the concerns expressed about the program.

I would like to thank the members of the committee for the opportunity to be here and I would like to entertain any questions that you might have.

Mr. ROE. We want to thank both of you distinguished representatives from New York City for your valid testimony.

The gentleman from Minnesota.

Mr. STANGELAND. I, too, Mr. Chairman, want to commend Mr. McGough and Mr. Tumolillo for a very extensive piece of testimony and I would yield to the gentleman from New York for whatever questions he might have.

Mr. MOLINARI. First, I thank the gentleman for yielding.

I must welcome these two fine professionals.

Mr. Chairman, we are very fortunate to have Commissioner Tumolillo and Commissioner Joe McGough, both of whom I worked with very closely and for whom I have a high regard.

I would like to see if we can get a little better fix on the problem of dredging in New York Harbor which is becoming increasingly important to the Port of New York and New Jersey.

Can you tell me how much dredging they are doing now in the city of New York, Mr. Tumolillo?

Mr. TUMOLILLO. The dredging in the bi-State port, the Port of New York and New Jersey, averages some 10 million cubic yards a year for both maintenance of slips and channels and any new construction.

Mr. MOLINARI. Is that amount equivalent to that which is required for normal maintenance?

Mr. TUMOLILLO. Yes, to maintain the navigable waterways at the depths authorized by Congress and the slips and berths adjacent to them, so that the cargo ships the passenger liners, towboats and so on can use the facilities in place, representing several billion dollars in capital investment. Without those slips and without the waterways, commerce with the city and with the neighboring jurisdictions in New Jersey would be severely hampered.

Mr. MOLINARI. I was under the impression that there is certain areas within New York Harbor that there will be further dredging required in order to make the navigable—the waterways of sufficient depth to accommodate the ships that are going through that.

Mr. TUMOLILLO. Right, in the area of the Kill Van Kull, which goes along northern Staten Island into New Jersey, the channel there is now 35 feet authorized by Congress and the proposal is to take it down as deep as 45 feet. That would require new construction, as one of the channels in the authorization bill. That project would be held up if the PCB contamination or the other pollutants were to interfere with the disposal of that dredge material.

Mr. MOLINARI. Let us get into that if we can.

What is your assessment as to the seriousness of the contamination problem as it affects the dredging of those waterways?

Mr. TUMOLILLO. One of the problems that we have in New York is getting a fix on each of the contaminants that are present in the harbor, the various heavy metals, PCB's, other hydrocarbons. EPA and the corps have begun to address each of those in series. PCB's being the first one that was addressed due to the problems that we faced in 1979. I believe the problem we face is that it is not a comprehensive program. It does not clearly delineate the costs and benefits; and operating somewhat on their own, the EPA and the corps and the region, although pressure to keep the port open have clearly signaled that the guidelines will require them to deny permits if the standards are exceeded. That is problem enough.

So we could not take the material to the ocean disposal site but there are no real serious alternatives that are viable at this time.

There are a number of proposals and the Army Corps of Engineers is moving aggressively to find alternatives to the ocean disposal of dredged material. Some progress has been made but those are still many years off before there is an alternative site. The problem we will face then is that the levels that are permissible will be exceeded prior to the availability of alternative sites and in that period, the port will face a very uncertain future and in turn the investment that is slated in the port, whether it be for the Navy or containers, or whatever, would have to be looked at again, if it really could not—if the harbor could not be dredged to accommodate those installations.

Mr. MOLINARI. What is your best recommendation?

Mr. TUMOLILLO. One recommendation would be to accelerate the pace of the Army Corps' program to find alternative disposal areas for dredge material. It should be pointed out that even in the deepening projects, say the Kill Van Kull, which to the full extent could generate 30 to 40 million cubic yards of dredge material, it is only the very top layer that presents the problem. The first foot or so of dredge material, once that is cleaned off, the rest of the material is by and large very clean material. It does not present a problem.

It is getting to that clean material that we go through the first foot of contaminated material. If the corps program were accelerated or perhaps disposal options for a small percentage of the material could be found, then the cleaner material could be disposed of easily either in landfills or in the ocean.

Mr. MOLINARI. Would you yield for a second?

Can you quantify for us, in terms of cubic yardage, what that 1 foot of contaminated material might amount to?

Mr. TUMOLILLO. Well, in an average year, in the 10 million cubic yards, somewhere around 10 percent of that presents some problem to the corps and EPA for ocean disposal.

I would hazard to say that perhaps that same number would apply in the Kill Van Kull project, probably slightly less given a 10-foot deepening, so perhaps 10 percent, 8 percent, would be approximate.

Mr. MOLINARI. Eight percent of the 10 million figure you are talking about?

Mr. TUMOLILLO. Yes; that would be approximate.

Mr. MOLINARI. Is it accurate for me to say that the material to be dredged in the Arthur Kill would be a great deal more contaminated than that which would be in the New York bay area?

Mr. TUMOLILLO. In the Arthur Kill?

Mr. MOLINARI. Yes.

Mr. TUMOLILLO. I think that would be a reasonable assumption. I have not seen the test data from that area but given the nature of the industries along there and some other problems that we already had over in Elizabeth with that toxic problem before, there is reason to believe that that waterway suffers more degradation, say, than the bay itself, but I would have to yield to environmental agencies in New York and New Jersey for that data.

Mr. MOLINARI. And Commissioner McGough, what about the method of disposal?

There has been some suggestion made that we consider using that dredge material for land fill, for cover for land fills.

Do you have any thoughts on that subject?

Mr. McGOUGH. My thoughts would be that as my colleague stated, the bulk of the material would not be contaminated; it could possibly be used for that purpose. However, with the other material that is contaminated, I think that we should look for alternatives other than land fill disposal, and I would endorse his suggestion that there be support here in this committee and elsewhere for the Corps of Engineers to complete their analysis and obtain an appropriate site for that material.

One of the responsibilities that I have in the city of New York as chairman of the hazardous waste task force is hazardous waste disposal which obviously is a very big problem. From the discussions that I have had with EPA, they are looking for incineration and incineration offshore as a research project should be given the highest priority by EPA. It seems to me in all these areas that disposal is a very knotty problem. We have all these funds to clean up, but where are we going to put it?

What are we going to do with it? I know from cleaning up waste oil facilities in the city of New York, where we spent $2.5 million to clean it up at city expense, that it was very, very difficult to find appropriate facilities that had appropriate licenses to properly handle essentially what was PCB-contaminated oil. And I think that oil is easier to dispose of because it burns of its own, but other materials like dredged oils would be more difficult. It seems to me that incineration holds the greatest promise at this point, and/or efforts in research, in developing those methods should be forwarded by EPA.

Mr. MOLINARI. How far away are we, though, from the point where we could have a technology in place to have incineration of that dredge material?

Mr. McGOUGH. I think we are relatively close.

There are already several vessels and I believe EPA has research projects already. So I do not think we are that far away. There are a lot of concerns that have to be looked at and we have to go carefully, but I would say in the not-to-distant future. I'm really not close enough to give you a precise answer on that, but it seems to me that a lot has been done and other nations are interested in it, as well, and there is, therefore, a lot of scientific activity in this area.

Mr. MOLINARI. I would like to ask this general question of both of you and accept an answer from either or both.

We do have a very serious problem on our hands in terms of dredging. It is one that is becoming a crisis, really. And while EPA is conducting studies and the Corps of Engineers is doing its own studies, we have had some problems with the corps in the past and there are some studies which concern me, and you represent two agencies that are involved in the subject areas.

In the immediate future, the near term future, what do you see as the most plausible answer to this dumping problem dredged materials?

Mr. TUMOLILLO. Let me take a stab at that for at least the facilities that we have in New York City.

The Corps of Engineers and the EPA both have done environmental impact statements on the feasibility of ocean disposal, for designation of the mud dump site. Both environmental impact statements recommended that that site be used in the short term, at least until it reaches capacity, which is only another 8 or 10 years, 12 years, depending upon the pace of the projects.

I would recommend in the short term that the following be done:

One, is that the dump site be continued to be used for the overwhelming bulk of material that passes the test.

Two, for the material like the PCB's where there is a guidance matrix in place, as long as that matrix reflects scientific understanding of the dangers of PCB and is not an artificial guideline, that interim programs—perhaps the capping program which I know has been of some controversy—but the programs where the contaminated material is to be covered to great depths by clean material and acceleration of that program might provide a short term solution to keeping the Harbor open while the longer term solutions are being pursued by the corps and EPA.

The capping program for members of the committee, is simply where you take the material that is considered contaminant to some designated area, dispose of it and immediately follow on that with clean material, sand, and so on.

And tests thus far seem to indicate that that keeps the material in place and it does not go out into the environment.

Mr. MOLINARI. You are talking about on land?

Mr. TUMOLILLO. No; it could be in the ocean, in designated areas. On land, you have additional problems of leaching down into the water table and that is a question that has not been fully addressed for the various sanitation land fills who would consider that, and that is a more complicated issue.

Mr. MOLINARI. But are we convinced at this point that encapsulating this questionable raw material at sea will truly prevent it from escaping and causing grave environmental harm to the surrounding waters?

Mr. TUMOLILLO. I think no one can give you a guarantee that this will never escape. I think the tests thus far seem to indicate that it is fairly stable and will not naturally erode.

I think additional work would have to be done to give you a much more level assurance on that.

However, one point should be kept in mind, that this material is already suspended in the rivers and waterways of New York Harbor, and the natural action of the harbor in terms of the tidal action, the flow of the Hudson River, will inevitably lead to this material coming out into the ocean, further areas out to sea, thus endangering the fishing and recreational uses of those waterways.

This is not material that is on land and we are looking to find a way to deal with it. It is already in the water environment and because it is there, it will move around and will settle in various places along the beaches and so on, and it is my feeling that if that is taken out, that it actually cleans up the inner harbor area, if the other programs that the Congress has worked on in terms of the pollution plants go forward. That will reduce the amount coming into the bay and if the material that is taken into the ocean is capped, that material is considered contaminated, we are further

ahead of the game then if we let it just sit where it is, let the harbor silt up and then have this material suspended in the environment.

Mr. MOLINARI. Is the Kill Van Kull a flushing tributary?

Mr. TUMOLILLO. There is tital action in there. The river action in there from New Jersey is probably not as great, nearly as great as the Hudson River, but there is some tidal flushing in there.

Mr. MOLINARI. I just have a question of Commissioner McGough on the 301 waivers.

Commissioner, I think the city of New York has made application for some six waivers; is that correct?

Mr. MCGOUGH. That is correct.

Mr. MOLINARI. And in your statement you tell us about the cumulative effects which of course is very key question here.

Are you aware of how many 301 waivers applications were made to EPA region 2, just from New York and New Jersey?

Mr. MCGOUGH. If my recollection serves me, it is just around 20. Maybe somebody—the chairman might know exactly. It is about that.

Mr. ROE. I think it is higher than that.

I think it is around 60 or something.

Mr. MCGOUGH. In New York?

Mr. ROE. In the New York-New Jersey area.

Mr. McGough. In the whole region?

OK.

Mr. MOLINARI. I think, if I am not mistaken, that the entire region was something like 31, but New York and New Jersey represented a vast majority. So, of course, the question came to my mind at the time, good God, what would happen if all of those waivers were granted?

Now, that was a question that EPA and region 2 had to answer and originally they said it was going to take them 18 months to be able to reach a decision as to the combined impact.

But then I think preliminarily they denied at least some of those applications.

Could you clear us up on that question?

Mr. MCGOUGH. Sure.

The exact status of, the city's six applications, they have notified us of intention to deny those six. We have in accordance with the regulations filed an intention to revise these; under that condition we are given 1 year to revise these applications and in revising these applications we are required to improve them and we are now going through the process of determing how we might improve these applications for their refiling within the 1-year period.

With respect to all the others, and impact of the Hudson, for instance, I am not sure how they stand in each case. I think some of them may have been granted. They were seasonal in nature rather than full time or year round.

Mr. MOLINARI. Are you involved in any information gathering process to determine the impact of the six that you have direct jurisdiction of, over, as opposed to the remainder and what impact it would have so you could spell out a case for yours?

Mr. MCGOUGH. Well, yes, we have.

In our application and in reply to the State department of environmental conservation's position of denial as well, we produced a rebuttal and in that we did address what we considered to be the possible impacts of other applications should they be granted variances.

Let me say that the city of New York believes that the assimilated capacities of the river must be shared, obviously with all the applicants and that is a very knotty problem, and it is a very, very important one.

So we are certainly not taking a position that we should be entitled to all assimilated capacities of the river that is absolutely not so.

At this point the interstate sanitation commission, a body which does include New Jersey, New York, and Connecticut, does have authority to pass upon these variance applications in the first instance and that body plays a very important role in determining what the assimilated capacities are and how these assimilated capacities might be divided equitably.

Mr. MOLINARI. Thank you.

I am going to pass at this time.

Mr. ROE. I recognize the gentlelady from New York.

Ms. FERRARO. I want to follow up on the 301(H) waivers.

You said that you have a year to improve those applications.

What do you do when you improve an application?

Do you indicate an alternate pollution control measure or what?

Mr. MCGOUGH. The applications, the intention to deny indicated that our applications still included water quality violations.

In other words, the application of the treatment process proposed in our application, would still result in water quality violations in the estuary system; therefore, in order to reapply we must eliminate those water quality violations.

Now, these water quality violations in our view are within the tolerances of the water quality model that we are dealing with which was developed by the city of New York under the 208 planning process. The city spent several millions of its dollars to develop this water quality planning model which is the one that is used by all of the municipalities in and around the harbor.

So the improvements must be to eliminate those water quality violations pointed out by the interstate sanitation commission.

Ms. FERRARO. You acknowledge that the city would save $450 million, I believe, in construction costs if those waivers are granted, and several million dollars a year in operating costs.

Isn't the city's opinion that this money could be spent on other pollution control measures that would have a greater positive effect on water quality?

Mr. MCGOUGH. Yes.

First, let me point out that this $450 million is the total amount of construction costs, 75 percent which is Federal, 12½ percent State, and 12½ percent city.

Yes, the biggest problem beyond the elimination of the raw discharges that are now occurring as the result of not having the North River and the Red Hook plant and developing a treatment that meets water quality standards, which we believe is covered in our applications, is storm water overflow control.

We have in the city of New York, and I know that all of the communities that border on the Hudson River and on the bays, both in Connecticut and New Jersey, also have primarily combined sewer systems. These systems, whenever you get any appreciable rainfall, the tide gates open, our regulators open and allow the combined flow of both sanitary wastes and storm water to discharge into the bays and harbors surrounding New York.

Now, it seems to me that this money could be put to better water quality use if it were used for storm water overflow control. There are institutional impediments at this point, some of which Deputy Commissioner Marsh alluded to, with respect to the set asides, and the adequacy of that approach, also the priority listing that the State currently has would have to be adjusted. It seems to me if these adjustments were made and that CSO's were recognized as an eligible grant category, that regionally we could pursue a strong water quality control program that could, in bang for the bucks, so to speak, have greater water quality improvements, than going to full secondary, in-plants like Newtown Creek and North River, where a substantial amount of capital savings would result.

So right now in going through the revision of our applications, I have been sitting down with the officials from the interstate sanitation commission, officials from New Jersey, and Connecticut as well as environmental groups and trying to get their assessment of this very question.

Cannot we get better water quality in our region from a transfer of these funds to other purposes rather than following rote, secondary water quality treatment, the secondary treatment requirement of the act.

Ms. FERRARO. That is precisely what the testimony was last year, Sister Frances Kress who appeared before this committee on behalf of the Clean Water Association, she came to testify with respect to Newtown Creek, which is in my district, and she said basically the same thing you did. She was discussing the combined sewer overflow situation and she stated:

> U.S. EPA's insisting that the Newtown Creek sewage plant upgrade to secondary treatment at an estimated cost of $275 million. I am chairperson of the Newtown Creek sewage treatment plant's Advisory Committee. I suppose I should be grateful that someone wants to spend so much money in our area on pollution control; however, secondary treatment for sewage plants ought not to be the highest priority item.
>
> It is neither the most urgent or the most cost effective expenditure. There are a number of other steps which would achieve much more environmental improvement for the dollar than secondary treatment.

I think what she was saying is what you are saying, that there may be better ways of dealing with this, but because the Federal Government has mandated the sewer treatment plant upgrading, that it seems that the bucks are having to go in that direction rather than in a way that might actually lead to cleaner water.

Mr. ROE. Would the gentlelady yield on that issue?

Ms. FERRARO. I would be happy to.

Mr. ROE. You know, I think what would be interesting would be to get the facts as they relate to the eligibility of the elimination of the combined sewers. That has been a major battle around here since 1970, and it seems to me that what the gentlelady is saying has a great deal of merit.

Mr. McGOUGH. I would certainly agree with that, yes.

Mr. ROE. The gentlelady from New York.

Ms. FERRARO. I have no further comments or questions.

I do appreciate the testimony on the PCB's because I think we have had extensive discussion on the problems that exist and certainly on the need for EPA to take a close look at their responsibilities as far as PCB's are concerned.

I thank you both.

Mr. ROE. I know the gentlelady feels as strongly as I do on that very issue, that PCB issue, and it seems to me, and I think that Mr. Tumolillo made the comment, that if Congress wants to do something about it, that Congress has to make the decision and break the log jam.

Is that not what we are basically saying?

Mr. TUMOLILLO. Yes.

Mr. ROE. All right.

Are there any further questions of these witnesses?

The gentleman from California

Mr. PACKARD. Just briefly, Mr. Chairman.

I appreciated the testimony of both of you gentlemen.

Mr. McGough, I recognize that you have made a significant plea for a balance between requirements for secondary treatment and those areas where it is not required and where it would not be necessary, and that your concern could be projected all across the country.

There are those areas that feel that they can meet the requirements of EPA without going secondary treatment and, secondary treatment as you know, can be extremely expensive.

Do you feel, however, in one of your recommendations that it will be cost effective to put in costly secondary treatment facilities and then only use it for part time during the year?

Is that the most cost effective way to meet the standards?

Mr. McGOUGH. In some instances it is really the only way to meet the standard because of the weather conditions. In the warm weather, particularly in our area of the country, you need a higher level of treatment because the oxygen demand is such in the summertime that without that higher level of treatment, you will have deficits in the receiving waters.

So, therefore, it is important in some cases, and in a number of other instances, maybe not all, where you have a tremendous tidal flushing condition, it may not be. But in many of our plants that protect bathing beaches, we are not applying for any waivers at all. We feel it is mandatory that we have year-round secondary.

So I think the weather conditions have a great deal to do with it, and I would say that we could not—I would not either propose that CSO control, even brought to the ultimate, could necessarily replace the need in the summer and winter months for, secondary treatment.

Mr. PACKARD. So it is your judgment that those decisions ought to be made at the local level or at the State level, rather than through Federal mandates as to whether to put in a certain level of treatment to meet the requirements of EPA, or whether it is not necessary?

Mr. McGOUGH. That is right.

I think that we have come to the point in the progress of this law that we are down to some of the fine points and there ought to be some flexibility with respect to this issue.

Mr. PACKARD. Thank you very much.

Mr. ROE. We want to thank you very much for your testimony. It has been very helpful to us today and we look forward to working with you.

Our next witness for the day is the Honorable Mayor Brian J. Lawler, who is the mayor of the city of New Bedford, Mass., and I will defer the honor welcoming the mayor to our good friend and Representative, Mr. Donnelly from Massachusetts.

Mr. DONNELLY. Thank you very much, Mr. Chairman.

On behalf of my colleague, Mr. Studds, I would like to welcome the mayor here before our subcommittee and I look forward to his testimony.

Mr. ROE. I want to welcome the mayor.

We are looking forward to your testimony.

TESTIMONY OF HON. MAYOR BRIAN J. LAWLER, CITY OF NEW BEDFORD, MASS.

Mr. LAWLER. Mr. Chairman, distinguished members of the committee, ladies and gentlemen, I thank this committee for granting us the opportunity to offer some observations on the Clean Water Act particularly as it affects our city, New Bedford, and other cities in similar situations.

There can be no thought of opposition to a law the purpose of which is to protect our environment and to improve the quality of life for all of our people. We are here for another reason. The question we raise and the concern we have come to express is the stringency of one of the mandates contained in the law. We contend that every city is different in its social and economic composition. This being so, any law which applies to every city must allow latitude of action to provide for the differences which may, as in our case, be very significant.

We are especially concerned about the mandate that a sewer use fee be implemented without exception. A law which does not provide for exception ceases to be law and becomes dictate. The implication of Federal dictate leads us down the road to a Constitution conflict. So serious is the possibility that we are compelled to object for ourselves and for all cities. It is not possible for the Congress to know the circumstances which apply in New Bedford unless we come to inform you.

We have now and have had for many years an operational sewage treatment plant. This plant is supported by the local real estate tax levy and we know that, given the mix of industrial and nonindustrial use, the levy is fairly assessed. There are no complaints from either side of the mix and harmony exists. Now comes the Federal Government through its agent, the EPA, and says, "Impose a sewer use fee or lose all Federal grants." We have explained to the EPA the special care with which we treat the industrial members of our civic family because of our chronic unemployment rate and how our people wish to be supportive of those businesses which provide employment and economic opportunity to our

city. To the credit of the EPA let me make clear that they have cooperated completely within the limits set by law. But their hands are tied. Our precise contention is that the EPA does not have the discretion to make an allowance which it recognizes to be desirable and necessary. Here is the weakness in the regulations. No provision is made for special circumstances.

In our city during this year there was an election. In that process the question of the imposition of a sewer use fee was critical. Our people divided on the issue between those who accepted, with a sense of fatalism, that no one could oppose or even question the dictate of the Federal Government and those who vehemently opposed the imposition of any new taxes. The result was clear. Our people wish to continue to support sewage treatment as they have always done and they resent and object to Federal dictates to impose new taxes. We subscribe to the theory of government which says that the voice of the people is the voice we represent and it must be heard.

We have a fine city and a people who are jealous of any infringement upon their liberty. Dictates are an infringement. This section of the act, because it does not allow for variance, is unfair.

We urge this committee in its deliberations and in the advice which it provides to the Congress that it should give very special consideration to the error it may commit by ignoring this simple instruction from a very loyal and dedicated people.

We would suggest a simple amendment of the Clean Water Act. The amendment would allow the EPA's Regional Administrator to waive the user charge provision under anyone of the following conditions:

One, if local government can demonstrate that the charge is not needed in order to generate sufficient revenues to properly operate and maintain the plant;

Two, if local voters reject the user charge provision on the local ballot;

Three, if the user charge provision would cause undue hardship on the local economy, and;

Four, if the local government can demonstrate that the problems related to trying to implement such a system outweigh the benefits.

Of course, the city of New Bedford is not alone in its opposition to the user charge provision. Many communities have given up needed Federal grants because of it. The local government has found the provision too restrictive. The voters have found the provision too offensive.

This should concern you.

These grants—which are supposed to help clean up the environment—are not reaching all the communities that need them because of these unnecessary regulations. In a sense, the environment is being threatened by the very law which is designed to protect it.

Something is wrong here. The environment should come first.

To deny our people the choice of how to fund their services is the simple beginning of the erosion of the right of all choice. Again, I urge the committee to allow in the law for some real latitude in the decisions of the EPA.

They know individual cases. They are trained and intelligent people. Let them use their talent. Let us make our choice.

Thank you very much.

If the chairman or other members have any questions.

Mr. ROE. Yes, I think your testimony is splendid.

The gentleman from Massachusetts.

Mr. DONNELLY. Thank you very much, Mr. Chairman, and thank you, Mr. Mayor, for your testimony.

I do not represent the fine and beautiful city of New Bedford, Mr. Mayor and I don't know the local politics. But in your testimony, you make allusion to the proportionate mix of real estate taxes on residential and industrial.

Is there some problem in terms of—and I know your problem with unemployment and economic development in New Bedford—is there some problem in the commercial industrial community with opposing a sewage user fee in terms of them moving out of the city or the loss of the potential mutation of economic growth?

Mr. LAWLER. Specifically, yes, that is one of the reasons that I am here before the committee.

New Bedford has a substantial supply of clean soft water. As a result of that, we attract to our area those industries that are high volume users. One of whom is the Goodyear Tire & Rubber Co., who makes presently in the city, a rubber insulated roof. They can make this competitively against foreign competition and they generate huge amounts of volumes of water. They have been very direct with us that if we charge them any type of an exhorbitant fee, all it is going to do is make them noncompetitive. We have special situations with them in the sense that while they use a tremendous volume of water, two-thirds of that water is used up in the manufacturing process. As a result, they generate a very small amount of water that they pump into our actual sewage system.

So we are placing some of our good companies at an unfair competitive advantage.

Mr. DONNELLY. Well, I suppose from the Federal side, the question is, how do we protect and guarantee our investment of Federal dollars into cities like New Bedford in terms of sewage, if we do not guarantee a funding mechanism for the operation and maintenance, along down that line, especially in States like Massachusetts, where the voters have placed a limitation on the amounts due to proposition 2½, a limitation on the amounts of revenues that you can raise, when you have the various groups all converging on your office demanding their share of a limited pie, the education lobby, the public safety lobby.

One of the concerns is that there is not a tremendous sewage lobby out there and we have to guarantee our investment, and that would be the Federal side, that would be our position on the Federal side.

Would you like to respond to that?

Mr. LAWLER. Well, the limitations of proposition 2½ were precisely the concern of the voter that it is believed by the voter that many cities are using the sewer user fee as a device to circumvent the limits of proposition 2½.

It was injected into our election and it was a pledge to the voters to continue to live within proposition 2½ or live within the limits of that; that was a substantial portion of my campaign.

The concern we then have is that if we are committed to live within those limits, and financially are capable to live within those limits, the city of New Bedford concluded the last budget year with a surplus of almost $1 million on a $78 million budget.

We are in fine, stable, solid financial shape. We can continue to fund and have funded for the past 8 years, fully funded, all the monetary needs for the sewage treatment plant.

But what we are saying now is that to comply with the Federal mandate, we must create a new taxing mechanism on one hand to provide the funds and at the same time, reduce from our general levy, that same like amount. So what we are creating is administrative nightmare to satisfy the wishes of our constituency.

See, we are being led by EPA to wade through a constitutional quagmire here of being forced to impose taxes we neither need nor the electorate has clearly stated it does not want.

Mr. DONNELLY. I understand very well the political problem because it has been a political issue in many of the cities that I represent in southeastern Massachusetts and the politics is difficult.

I would hope that you would provide the appropriate correspondence that you have received from the EPA regarding this and specifically any from your planning director or economic development director, an analysis of the economic damage in terms especially of Goodyear or any other industrial plants in your city, if that would be done, or communication that you have received from those companies, if you move forward and apply this sewage user fee.

Mr. LAWLER. Well, all we are really asking is that there be some mechanism in the law, that when you get a special type of situation, which like the city of New Bedford, which has an abundance of water that we sell cheaper than probably every community in New England, that we have in that type of a situation to suddenly inject, the tax structure to inject a new ingredient into the tax structure, to change the mix between the balances of all the forces, when we move the incidence of tax payment from exactly where it is now, we run the risk of putting our whole economic picture into disharmony.

Mr. DONNELLY. Let me congratulate—let me say in conclusion that I would like to congratulate you, Mr. mayor, for your surplus.

Again, on the Federal side we have to be guaranteed that the administrators of that city be as competent fiscally over the course of the next few decades as you have been in your terms.

Mr. LAWLER. We also offer to guarantee that in writing to the EPA that that will be a priority funding item for us.

Mr. ROE. As I understand the issues, so that we have it clear in our minds, what you are simply saying is, you are not debating the issue of whether or not New Bedford will pay its share in return of the Federal money.

Basically what you are saying along the line, if you choose in you community to include that cost within your municipal budget, you should have the prerogative to do so as long as your bring the responsibility back to the Federal Government; is not that basically it?

Mr. LAWLER. That is exactly correct.

Mr. ROE. And at the moment you are constrained from doing that, EPA says they are constrained because the law does not appear to allow them to recognize that particular municipal need, is that correct?

Mr. LAWLER. That is correct.

Mr. DONNELLY. The question—if I could reclaim my time, I think a further question is, what guarantees does the Federal Government have over the course of time that a proportionate amount of that tax money is going to be spent to maintain the operation and the continuation of the sewage treatment plant, and the facilities?

That is why in the law it is mandated that a set tax, dedicated fund, be set aside so that our investment is protected and there is a guarantee and the question of allowing exemptions, I think, ought to be clearly looked at, because it should not be used in a punitive way in situations such as the city of New Bedford, the loss of the major industry, but I would hope that the committee would look very carefully before we move forward and allow a broad across-the-board exemption for people not to set these fees and it is certainly very difficult situation to politically, on the local level, but there is a Federal mandate that we protect, that they pay their taxes and their W-2 forms to the Federal Government along with the local property tax.

Mr. PACKARD. Would the gentleman yield?

Mr. DONNELLY. I would be glad to yield.

Mr. PACKARD. I think that the point is that those guarantees that you speak of are in such a form that they mandate precisely how the money is to come about. I think that is what the mayor is concerned about, and in my judgment I think it is a justifiable concern.

I have to assume, Mr. mayor, that you are meeting the requirements of the Clean Water Act?

Mr. LAWLER. We are, and we have also signed a consent agreement with EPA in the terms of creating the billing in a manner which is satisfactory to them within the limits of the dictates of Congress. But my contention has been that the Congress has been focusing too hard on which pocket the funds should come from and we at the local level are just focusing on the particular taxpayer. We know that it is going to come from the same sources.

It is just we are asking that when there are special circumstances and justifiable, that the EPA can have that permission to grant that waiver.

Mr. PACKARD. I thank the gentleman for yielding.

Mr. DONNELLY. I have no further questions.

Mr. ROE. Any further questions of the mayor?

Mr. PACKARD. Just one, Mr. Chairman.

You referred to Goodyear, I believe it was Goodyear as one of your industries.

Mr. LAWLER. That is right.

Mr. PACKARD. And you have given them consideration to allow them to become economically stable in your community?

Mr. LAWLER. Yes.

Mr. PACKARD. Are they meeting the discharge requirements?

Mr. LAWLER. Yes.

They are, to us, a very good employer and a good neighbor.

Mr. PACKARD. But are they polluting your water supply?

Mr. LAWLER. No, they are not.

Mr. PACKARD. I see.

Thank you.

Mr. ROE. No further questions?

Mr. mayor I want to thank you very much for bringing your matter before us. We will give it every consideration. We appreciate your being here this morning.

[Subsequent to the hearing, the following was received from Mayor Lawler:]

CITY OF NEW BEDFORD, MASS.,
EXECUTIVE DEPARTMENT, OFFICE OF THE MAYOR,
September 22, 1983.

Congressman ROBERT A. ROE,
Chairman, House Subcommittee on Water Resources,
Washington, D.C.

DEAR CHAIRMAN ROE: It was my pleasure and privilege to appear before the Subcommittee on Water Resources this week to propose an amendment to the Clean Water Act (PL 95-217). I suggested that the law needs to be revised: it needs to add a provision allowing the Environmental Protection Agency (EPA) to waive a sewer use fee if such a waiver is justified.

At Tuesday's hearing, a committee member pointed out that the federal government must "protect its investment" by making sure that a mechanism is in place to provide sufficient funds to operate and maintain wastewater treatment plants which are constructed with federal dollars. I agree. But a sewer use fee is not the *only* viable mechanism.

In my City, our plant has been funded through the local real estate tax and no one—industry, commercial or residential—has complained. We wish to continue this practice. We are willing to place our financial commitment in writing. The law prohibits us from doing so.

We ask that you amend the Clean Water Act to allow New Bedford and cities like it to utilize alternative funding mechanisms if those mechanisms guarantee full funding and are approved by the EPA. Our request is a reasonable one and I urge you to give it your early consideration.

Thank you for the opportunity to appear before your committee to discuss this important matter. If I can answer any questions, do not hesitate to call me at 999-2931, extension 300.

Very truly,

BRIAN J. LAWLER, *Mayor.*

Mr. ROE. The Chair will now recognize Mr. David Delcour, who is chairman of the clean water ad hoc committee, Western Regional Council.

We want to welcome the gentleman to our committee.

You have a substantive statement. It will appear in full in the hearing record, if there is no objection.

The gentleman would please be kind enough to summarize, it will be helpful to us.

[Statement referred to follows:]

STATEMENT OF THE

WESTERN REGIONAL COUNCIL

Mr. Chairman and Members of the Subcommittee:

The Western Regional Council appreciates the opportunity to bring to the Subcommittee's attention five amendments the WRC proposes to the Clean Water Act. I am David Delcour, Vice President of AMAX, Inc. I am appearing here today as Chairman of the Western Regional Council's Clean Water ad hoc Committee.

The Western Regional Council was organized to provide a unified voice for the business community of the Intermountain West. Its membership is composed of chief executive officers of corporations representing a number of major industries in the Intermountain West. The WRC works to establish balanced policies which consider the benefits of both economic development and environmental preservation in the West.

Water is a critical commodity in the West; therefore, quantitative and qualitative water management is of significant importance to the Western Regional Council. The Clean Water Act is now before the Congress for reauthorization and the Western Regional Council supports the basic concepts of that Act. Although the Council supports the basic concepts of the Clean Water Act, the Council asserts that a nationwide "across the board" application of the Act results in certain provisions having a significant adverse impact on the West due to the unique features of western water (See Appendix A). The intent of the Council's recommendations is, therefore, not to change the basic concepts of the Act, but to provide the flexibility in implementation which is required for sound water management in the West. The Council's testimony will address five areas of the Act which, in the WRC's opinion, are in need of amendment.

POINT SOURCE DEFINITION

One of the chief purposes of the Clean Water Act is to regulate the discharge of harmful pollutants from industrial processes. However, the Act only regulates discharges from "point sources," which are generally defined as "discrete conveyances" such as pipes (Sec. 502(14)). The Act does not, for example, authorize EPA to regulate diffuse storm runoff or snowmelt running across an industrial facility. However, EPA has interpreted the term "point source" to include devices which gather, collect or otherwise divert stormwater runoff or snowmelt. As a consequence, mining and other industrial facilities that would have no obligation to treat diffuse stormwater runoff or snowmelt, but have constructed diversion structures to prevent diffuse storm runoff or snowmelt from contacting process areas and contacting toxic materials, are often required to obtain an NPDES permit requiring them to treat these waters. However, the Office of Surface Mining does require coal mines to collect

stormwater and these devices are classified as point sources regulated under the Clean Water Act. The 1977 amendments to the Clean Water Act require best management practices to control discharges of toxic materials. If stormwater device discharges are toxic, they would also be covered under this provision of the Act.

Impact on the West: The amounts of stormwater runoff and snowmelt in the mountainous areas surrounding western mining facilities are very large and the cost to treat this runoff is often prohibitive. Much of this stormwater runoff is not toxic and to require treatment of water not contaminated by the industry seems punitive.

Recommendation: Devices that merely divert or gather and collect storm runoff and snowmelt without adding to their contamination should not be considered "point sources" subject to EPA regulation. Including such devices in the definition of "point source" penalizes many companies for installing devices that serve to prevent or minimize pollution and were not required to be installed.

Amend Section 502(14) of the Act, 33 U.S.C. 1362(14), to read as follows:

> The term "point source" means any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissures, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft from which pollutants are or may be discharged. The term does not include return flows from irrigated agriculture or stormwater runoff. As used herein, "stormwater runoff" means discharges from conveyances or systems of conveyances (including pipes, conduits, ditches, and channels) primarily used for collecting and conveying precipitation runoff and which are not contaminated with process wastes, raw materials, toxic pollutants in excess of toxic pollutant effluent standards or prohibitions, hazardous substances in reportable quantities, or oil and grease.

This proposed language is generally consistent with the U.S. Environmental Protection Agency's November 18, 1982, regulatory proposal.

The Senate Committee on Environment and Public Works has seen fit to include similar amendments in its bill to amend the Clean Water Act. The WRC hopes this Subcommittee will also consider the inclusion of such an amendment.

Three brief examples of the problem of stormwater runoff devices being classified as point sources are as follows:

1. Hecla Mining Company's Lucky Friday No. 3 Tailings Impoundment in Mullan, Idaho has a diversion which parallels Interstate 90. It was constructed to prevent excessive water impoundment during periods of high runoff. If this is misconstrued as a point source discharge, a separate NPDES permit would be required.

2. At Hecla Mining Company's Republic Mine, Republic, Washington, the Department of Ecology is requiring a diversionary structure to be constructed around the Aspen Tailing Impoundment to prevent contamination of stormwater runoff. Once again, this discharge may require a permit if this section of the Act is not amended.

3. Hecla Mining Company's Sherman Mine, Leadville, Colorado, currently diverts spring runoff water around surface facilities in a 36" galvanized pipe. This water is discharged into a gulch below the mine site. The Colorado Department of Health, having jurisdiction over the NPDES program, requires that an NPDES permit be obtained for this discharge.

ZERO DISCHARGE GOAL

It is the goal of the Act that the discharge of pollutants into navigable waters be eliminated by 1985 (also known as zero discharge goal). The legislative history reveals that Congress never intended the zero discharge goal to be legally binding, but only a "target". The term pollutant is broadly defined under the act to include all waste regardless of quality (Section 502(6)). Therefore, regulatory bodies are interpreting the goal literally to mean that all discharges, including the return of reclaimed water from industrial and agricultural use, must be eliminated by 1985 regardless of quality. Thus, the "zero discharge" concept is moving the implementing sections and programs in the Act toward elimination of all discharges. In the Intermountain West, water basin compacts and surface water adjudications have been based on historical flows which include return flows after upstream water use. Also, many of the water users on such rivers as the Colorado are anticipating return flow credits in order to fulfill future water needs. However, as a result of the zero discharge goal, as interpreted by state and federal agencies, states are being compelled to abandon water rights. Relative to water quality concerns, states are again compelled to encourage consumptive

use regardless of the fact that water quality impact from returned waters would be negligible. This effectively results in the compromising of the policy in Section 101(g) to protect a state's right to allocate water quantities within its boundaries and manage its water based on both quantity and quality considerations.

Impact on the West: In the Intermountain West where many surface streams can reach zero flows during periods of the year, downstream water availability relies heavily on the return of water to the surface stream. For example, Arizona, in its Water Pollution Control Act, requires the regulatory agency, in adopting regulations concerning discharges, to "... be guided by the principle that waters of the State are put to beneficial use within the State and become return flows to the waters of the State and subsequently reused, and that such rules and regulations shall not diminish the water available for such beneficial uses, nor deprive the State of such water." (A.R.S. Section 36-1854 B). EPA Region 9 has refused to grant primary enforcement authority to the State of Arizona under the NPDES program. A major stumbling block in this delegation of authority has been this legislative policy which Region 9 believes conflicts with the zero discharge goal. The real goal should be to eliminate the discharge of pollutants in harmful quantities.

Recommendation: It is recommended that Section 101(a)(1) be amended to read as follows:

> "It is the national goal that the use and re-use of waters of the United States be achieved with the minimum increase of pollutants and that the discharge of pollutants in harmful quantities into navigable waters be eliminated by 1985."

The Senate Committee on Environment and Public Works dealt with this issue in the legislative history of the Committee's amendments to the Clean Water Act. The WRC would ask that this Subcommittee consider the acceptance of the WRC's recommendations. However, if this recommendation is not acceptable, the WRC would ask that this Subcommittee consider the Senate's legislative history language regarding this issue.

NAVIGABLE WATER DEFINITION

EPA's jurisdiction for regulation of water discharges under the Clean Water Act is confined to "navigable waters". The Agency, pursuant to court decisions, has defined the term "navigable

waters" broadly so as to include stream beds that: (1) have water in them only occasionally as a result of rains or snowmelt; (2) do not support fish, shellfish or wildlife; (3) do not provide water to downstream users; and (4) do not flow into other streams, rivers, or lakes.

As a consequence of EPA's broad definition of the term "navigable waters", sources that discharge into such stream beds are threatened with large capital and operating expense to meet the Agency's effluent limitations regulations, even though the discharges do not harm surface waters nor adversely affect water quality in other water bodies.

Unique Features of Western Waters: The definition of navigable waters at Section 502(7) is so broad that it encompasses nearly every water course in the United States, including many normally dry arroyos in the West. Because of this broad definition, the prohibition at Section 301 of the discharge of pollutants into waters of the United States without a permit applies to many streams which may not need this level of protection. In the arid western United States, there are streams which flow intermittently as a result of rain runoff or snowmelt, and when they do flow, do not empty into public bodies of water which need protection, do not support fish or wildlife and do not provide water for downstream users.

For instance, some industrial discharges are into streams which empty into desert playas which are in fact sealed basins where the water eventually evaporates. Most desert playas contain considerable naturally occurring salts and their waters are not used. Therefore, to require treatment of discharges into these playas is to require treatment for treatment's sake, since no use is made of the discharged water.

Recommendation: The definition of navigable waters (Section 502(7)) should be narrowed to exclude those bodies of water which have water in them only intermittently as a result of rain runoff or snowmelt, do not support fish, shellfish, or wildlife, do not provide water to downstream users, and do not flow into other water bodies.

NAVIGABLE WATERS AND WETLANDS

The overbroad definition of navigable waters also includes wetlands and requires that Section 404 Dredge and Fill permits not be issued unless specific steps have been taken to minimize adverse impacts on wetlands.

Impact on the West: As a result of court decisions and agency regulations, the definition of wetlands has been expanded to include "vegetation typically adapted for life in saturated soil conditions". In the West, this results in land temporarily saturated from snowmelt runoff and irrigation to fall under the jurisdiction of the Corps' 404 permit program.

In the spring, snowmelt and subsequent runoff causes streambeds to overflow and adjacent lands to be temporarily saturated. Wetlands-type vegetation appears even though the stream may be dry at other times of the year. This results in many areas adjacent to intermittent streams in semi-arid areas being considered wetlands. Even though activity on these areas or affecting these areas do not have an adverse effect on navigation or interstate water quality, permits are required for wetlands protection.

Furthermore, it is not uncommon to find that lands in western river valleys have been or are irrigated for either farming or grazing purposes. As a result of the temporarily saturated soil conditions from irrigation, wetlands-type vegetation occurs on the borders of irrigation ditches, as well as in irrigated pasture lands. Under the present law, no permit is required for the discharge of fill materials into an irrigation ditch, yet activity on the "adjacent" irrigated land may require a permit. In Appendix B you will find an example of where irrigated pastures and lands, only inundated in the spring as a result of snowmelt, are being required to have 404 permits.

Mining and energy development are often located in rural mountain valleys where either one or both of these temporarily saturated soil conditions exist. The impact of such development can be widespread if a major development is proposed or it can be very localized if a single building is constructed. In either case, the Corps' present practice is to require developers to apply for a 404 permit. To help mitigate the impact, the Corps will either deny the permit, require costly alternatives to the project, or require costly habitat replacement. This is objectionable not only because of cost, but because it assumes all wetlands, even irrigated pastures, are of equal importance and deserve the same degree of protection. Furthermore, it allows the Corps to assert jurisdiction in areas of traditional local and State authority.

Recommendation: The definition of navigable waters (Section 502(7)) should be narrowed to eliminate artificial and/or seasonal wetlands. This can also be accomplished by

20-955 O—84——28

exempting certain wetland areas under Section 404. These exemptions should include:

1. Lands adjacent to streams that either flow or overflow as a result of runoff waters.

2. Lands adjacent to isolated lakes, potholes, arroyos, intermittent streams and other waters that are not part of a tributary system to interstate waters or navigable waters.

3. Land areas containing wetlands-type vegetation as a result of irrigation practices.

THE EFFECT OF WATER QUALITY STANDARDS ON WESTERN WATER

When Congress adopted the Federal Water Pollution Control Act Amendments in 1972, attention in both government and industry was focused on implementation of the NPDES permit program and the development of technology-based effluent limitation guidelines (i.e., BPT and BAT). The permit program is now in place and effluent guidelines have been adopted for most major industries. With these jobs out of the way, significant governmental effort is being directed back towards the Act's original, pre-1972 concern -- the development and protection of ambient water quality standards.

Section 303(c) of the Clean Water Act requires states to establish "water quality standards" for all "navigable waters" within their borders. These "standards" must consist of two things:

1. Designated beneficial uses for the waters; and

2. water quality criteria for those uses.

Once adopted, these standards must be submitted to EPA for approval. EPA must grant approval if the standards meet "the requirements" of the Act. If EPA "disapproves" any standard submitted to it, the concerned state must be given a reasonable amount of time to develop a substitute standard which then becomes federally enforceable.

The standards have a direct regulatory impact because of the role they play in the NPDES permit program. Section 301(a) of the Clean Water Act prohibits all discharges of pollutants to "navigable waters" except as authorized by an NPDES permit.

In turn, Section 402(a) of the Act requires these permits to "meet" certain minimum requirements. The most prominent of these, as discussed above, is the requirement that discharges reflect minimum levels of treatment technology, i.e., BPT and BAT. However, Section 302(b)(1)(C) of the Act also provides that:

> ...there shall be achieved..
>
> ***
>
> not later than July 1, 1977, any more stringent (effluent) limitation... required to implement any applicable water quality standard established pursuant to this Act...

In other words, dischargers must meet effluent limitations more stringent that BPT and BAT -- the technology-based standards -- if necessary to protect receiving water quality.

Impact on the West: Water quality standards are generally more stringent than technology-based effluent limitation guidelines, i.e. BPT and BAT. In wetter regions of the country, this disparity has little or no practical regulatory effect -- dilution flows generally enable technology-limited discharges to protect receiving water quality. Unfortunately, in perhaps the majority of cases in the arid west, industrial dischargers are asked to install treatment systems that are "better" than what EPA has defined as being "best". At a minimum, this creates confusion and uncertainty, and unreasonably increases the cost of compliance. At worst, it can lead to shutdowns, and prevent industries from locating or expanding their operations in desirable areas.

This breakdown in the regulatory process is the result of several practical problems in the way EPA and the states have implemented the standard-setting process:

1. In the course of preparing their proposals, standard-setting agencies totally ignore economic and technical limitations. Thus, their proposals fail to reflect any sort of meaningful planning.

2. Due to the absence of any advance correlation between water quality standards and effluent limitations, industries are unable to predict the economic consequences of the agencies proposals. Even if agencies consider economics in the standard-setting process, the

standard still would not adequately reflect practical economic concerns.

3. Furthermore, if meaningful economic information could be presented at standard-setting hearings, EPA limitations on the ability to elect against "fishable, swimmable" waters would render most data irrelevant.

In order to remedy this, industries and the States need to be allowed to consider economic issues to the permitting process without EPA disapproving such permits strictly on the basis of the "zero discharge", "fishable. swimmable" goals of the Act. For a more indepth discussion of the problem, the reader is referred to Appendix C. Appendix C contains a general example, one case study, and two examples which clarify this issue.

Recommendation: The solutions to the problems just discussed are very complex. Ideally, the existing standard-setting process should be modified to require a comprehensive, basin-wide water quality assessment, an assessment of the impact of proposals on dischargers, and a comparison of these impacts with regional planning goals. And, in fact, Sections 208, 303(e) and 304(a) of the Act suggest that such a modification would be consistent with the existing statutory scheme. However, as a practical matter, comprehensive hearings such as this are never held for the issues are too complex. Instead, each of the elements is addressed on a piecemeal basis.

In view of this situation, the most practical solution is probably to amend Section 302.

Section 302(a) of the Clean Water Act grants EPA the power to impose effluent limitations more stringent than those required under Section 301(b)(2) (i.e., BAT, BCT, and toxic pollutant effluent standards), if such limitations are necessary to protect public water supplies, agricultural uses, recreation, wildlife, fish, or shellfish. However, before taking such action, EPA must review the social and economic impact of the more stringent limitations. They cannot be imposed if there is "no reasonable relationship between the economic and social costs and benefits to be obtained . . ."

A new subsection should be added to Section 302 requiring a similar review for all water quality based effluent limitations, whether imposed by EPA under Section 302 or by a state under Section 301(b)(1)(C). In effect, this would allow dischargers to consider economic issues in permit proceeding, and eliminate the "Catch-22" that prevents any detailed considera-

tion of economic and technical issues until the discharger has worked though a compliance schedule.

The WRC also recommends that the statute be amended to ease EPA's restrictions on the state's ability to decide that "fishable, swimmable" waters are not desirable. In fact, as a matter of administrative policy, EPA is in the process of doing this. However, a statutory clarification would still be desirable for it would reinforce what EPA is now doing and it would prevent future administrations from reversing the policy.

The statute should be amended in two ways to accomplish this:

1. Amend Section 101(a)(2) to provide that the "fishable, swimmable" goal is only desirable if it can be attained in an economically reasonable matter.

2. Amend Section 303(c) to modify EPA's role in the review and approval of state water quality standards. Provide that EPA may only disapprove of a standard if it is totally unsupported by the record, and will have a substantial adverse effect on interstate water quality.

CONCLUSION

Mr. Chairman, the Western Regional Council appreciates the opportunity to present its proposed amendments to the Clean Water Act. Your considerations of the Council's views is appreciated.

APPENDIX A

DEFINITIONS OF SOME OF THE UNIQUE FEATURES OF WESTERN WATER

Playas

The large number of ephemeral desert lakes, pans, or playas in the West is reflective of the poorly defined drainage of the characteristically arid areas. Generally, a playa is a shallow, central basin of a desert plain in which water gathers after a rain and then evaporates. It has its own drainage basin, which is a closed system, and will not run into a main stream system. Specifically, the main types of desert-lake basins and their hydrologic significance are:

1. Tectonic Lakes. These are generally the largest and occupy the centers of depressed land areas. They tend to be the center of interior drainage systems, i.e., the area into which the adjacent land drains and has no surface outlet. Such lakes commonly date from earlier periods of heavier rainfall. Despite the rarity of surface flooding and the high evaporation losses, the water table is normally close to the surface. Such lakes are most common to the West.

2. Lakes Formed by the Poorly Defined Drainage. These lakes commonly occupy parts of former valleys which have become self-contained basins as the result of a changing climate. They may remain part of a former tributary systems, or they may be isolated from surface drainage. They are a form of barrier lake, dammed by the deposition of sediments left by the former valley or by the encroachment of windblown sands. They may be fed by surface flow or shallow groundwater from infiltration from the margins of the basins. They do not necessarily become collection points of subsurface drainage.

3. Lakes at Drainage Terminals. These are normally shallow basins of sediment deposition, at the end of or adjacent to major stream beds, fed by floodwater or by an outflowing branch of a river, i.e., a delta. They may be fresh or brackish, and are fed entirely by surface flow.

4. Lakes Formed in Uneven Surfaces of Wind Blown Deposits (Sand Dunes). These include shallow pans in dune swales or in hollows in a sand plain, and they may be fed by local runoff and seepage or by flooding. (The Handbook of Applied Hydrology, Ven Te Chow: Editor, 1964).

Intermittent Streams

Stream channels which carry water part of the year and are dry the other part, but which receive flow from the groundwater table when it is high enough, are called intermittent. (Streams: Their Dynamics and Morphology, Marie Morisawa, 1968).

Arroyos

An arroyo is a vertical-walled, flat-floored channel of an ephemeral stream in the semi-arid Southwest. (Dictionary of Geological Terms, American Geological Institute, 1962).

Ephemeral Streams

Ephemeral stream is a stream or a portion of a stream which flows only in direct response to precipitation. It receives little or no water from springs and no long-continued supply from melting snow or other sources. Its channel is at all times above the water table. (Dictionary of Geological Terms, American Geological Institute, 1962).

APPENDIX B

AN EXAMPLE OF THE NAVIGABLE WATERS AND WETLANDS PROBLEMS IN THE WEST

GUNNISON COUNTY, COLORADO

In December, 1980, the U.S. Corps of Engineers, Sacramento District, sent the following letter and map to Gunnison County showing "preliminary wetlands" in the county.

You will notice the the City of Gunnison is almost totally surrounded by what the Corps identifies as "primary wetlands." The problem is, indeed, as the Corps describes it in the fourth paragraph: "...the scope of the problem is enormous. Virtually all building sites around Gunnison are in a wetland and would require a permit for the placement of fill."

A March 6, 1981, letter from the Corps to the office of Senator Armstrong further clarifies this issue and is included in this appendix. However, contrary to the tone of the March 6 letter, as of June, 1981, this controversy was still unsettled and substantial progress toward a solution had not been made.

One of the ramifications of such a broad definition of what constitutes a wetland is to encourage the elimination of wetlands. Even if a site had been considered a wetland in the past, it would no longer be designated as such should irrigation cease and the land be dried.

The intent of presenting this example is not to debate the specific Gunnison County case but to show how the overbroad definition of navigable waters to include seasonal and artificial wetland areas seriously impacts the West.

REPLY TO ATTENTION OF SPKCO-O

22 December 1980

Gunnison County Commissioners
200 E. Virginia Ave
Gunnison, Colorado 81230

Gentlemen:

Inclosed, you will find a copy of a preliminary wetland map recently completed by personnel from our Grand Junction office. The maping is of the immediate Gunnison area.

The area cross-hatched on the map is primarily wetland. There may be small or isolated upland areas within the designated wetlands, but access to them would impact the wetlands. Under Section 404 of the Clean Water Act, a Corps of Engineers permit is required before dredged of fill material can be placed in "waters of the United States or their adjacent wetlands."

A recent inspection of the Gunnison area reveals that a great deal of filling is taking place, mostly in conjunction with new housing construction. Such filling in wetlands requires a Section 404 permit. The Corps of Engineers has the responsibility to enforce the provisions of Section 404 and can direct those who place dredged or fill material in wetland without a permit to cease and desist from such activities.

As you can see on the inclosed map, the scope of the problem is enormous. Virtually all building sites around Gunnison are in a wetland and would require a permit for the placement of fill. Because of the rapidly accelerated growth in and around Gunnison a large number of applications can be expected.

In order to avoid further problems in the area, we feel that is critical that the city, county, and the local Corps regulatory personnel meet at the earliest possible date and begin a process of evaluating the problem and implementing a solution. It is possible that a master development plan could be designed that would minimize the wetlands impacts and still allow Gunnison to grow and progress.

Please reply at your earliest possible convenience to our Grand Junction Regulatory Unit, 2784 Crossroads Blvd., Grand Junction, Colorado 81501, (303) 243-1199.

Sincerely,

G. M. PROMASCO
Chief, Construction-Operations Division

REPLY TO
ATTENTION OF SPKCO-O

6 March 1981

Mr. David Jensen
Senator William Armstrong's Office
United States Senate
Washington, D.C. 20515

Dear Mr. Jensen:

As you requested in a telephone conversation with personnel of our Grand Junction Regulatory Office, we are inclosing a copy of an Information Sheet on the wetlands situation in Gunnison County, Colorado. If we can be of further assistance or provide additional information, please do not hesitate to contact us.

Sincerely,

D. A. DENNIS
Chief, Construction-Operations
Division

1 Incl
As stated

INFORMATION SHEET

AREA DESCRIPTION: The area includes the Gunnison River Valley immediately surrounding the Town of Gunnison, Gunnison County, Colorado, Townships 49 North and 50 North and Ranges 1 West and 1 East. The area is adjacent to Tomichi Creek, on the south, and to the Gunnison River and Ohio Creek on the west and north. A large percentage of this area is irrigated pasture and supports the vegetative species indicative of wetlands. The area is typical of many Colorado wetland pastures, where the distinction between irrigation-caused wetlands and naturally occurring wetlands is difficult to determine. Regardless, the wetland meadows are adjacent to "waters of the United States" and are considered individual permit areas.

2. WORK DESCRIPTION: Several new construction projects, mostly housing developments, are occurring in the Gunnison area in the wetland pastures adjacent to the Gunnison River, Ohio Creek, and Tomichi Creek.

3. HISTORY: The Corps of Engineers has been active in Gunnison County since June 1977. During that time, the Corps has processed 13 Section 404 violations and issued a number of permits, including 4 projects under General Permits for Highway Construction, 6 under the General Permit for Stream Habitat Improvement, 7 Individual Permits, 14 Nationwide letters for Bank Protection, 2 for Work above the Headwaters, and 5 for Minor Road Crossings.

On 14 August 1980, personnel from our Grand Junction Regulatory Unit were making an inspection in the Gunnison area and noticed several new construction projects had been accomplished in wetland areas north of the Town of Gunnison. In addition, they determined that several proposals had been made for construction in wetlands along Tomichi Creek and the Gunnison River south and west of Gunnison. Upland building sites in the Gunnison area are scarce. The scope of activity made it apparent that building had to be allowed to progress somewhere. It was also evident that writing individual cease and desist orders would be impractical and, possibly, counter-productive, and that some kind of area planning effort was needed.

On the 24th and 25th of November 1980, personnel from our Grand Junction Regulatory Unit again visited Gunnison and accomplished a working preliminary map, outlining the problem wetland area in and around Gunnison.

On 22 December 1980, the Corps of Engineers sent a letter to the Gunnison County Commissioners and to the Gunnison City Manager explaining the wetlands problem in the area and asking that a meeting be held to evaluate the problem and determine a solution. A copy of the preliminary wetland map was inclosed with each letter. Similar procedures had been previously accomplished in other Colorado counties with satisfactory results.

Subsequent telephone conversations established 2 February 1981 as the best meeting time.

be held to evaluate the problem and determine a solution. A copy of the preliminary wetland map was enclosed with each letter. Similar procedures had been previously accomplished in other Colorado counties with satisfactory results.

Subsequent telephone conversations established 2 February 1981 as the best meeting time.

On 29 January 1981, the Gunnison County Times published a copy of the Corps' 22 December 1980 letter as well as the preliminary wetland map and an inflamatory editorial commentary on the Corps' involvement in the Gunnison area.

On 2 February 1981, Mr. Rodney Woods and Mr. Darrell Arnold attented the scheduled meeting in the Gunnison County Commissioners' Room. Approximately 100 concerned citizens, ranchers and developers were in attendance, a direct result of the 29 January issue of the Gunnison County Times. Because of the nature of the gathering, the scheduled planning session was postponed. Instead, the Corps personnel answered a two-one half (2½) hour drill of individual questions from the audience and two attorneys about general and specific applications of the 404 permitting process.

On 2 February 1981, a more objective newspaper article was published in the Gunnison County Times outlining the proceedings of the 2 February meeting.

On 4 February 1981, Mr. David Jensen of Senator Bill Armstrong's Washington office, called Mr. Darrell Arnold of the Corps' Grand Junction Regulatory Unit. Mr. Jensen mentioned several calls had been received from the Gunnison area. Mr. Arnold discussed with Mr. Jensen details of the Gunnison situation as described herein.

On 6 February 1981, the Crested Butte Chronicle published a balanced and accurate article on the 2 February meeting.

On 10 February, Mr. Rodney Woods, of the Grand Junction Unit, attended a meeting with city and county planners in Gunnison. The 404 program was again discussed and county planning maps were obtained to study for possible issuance of a general permit. The maps describe the planned concentrated areas of development, high water table areas, and soil conditions. The water table and soils maps show indications to wetlands that may help determine non-irrigated wetlands.

Gunnison County plans to double its population in the near future because Amax Inc. plans to open the Mt. Emmons Molybdenum Mine. Therefore, with environmental restrictions being considered, the likely concentration of development is in areas of existing community development which will be on irrigated wetlands.

Discussions with the city and county planners included the possibility of some detailed mapping which would separate areas, above the flood plain

and least valuable to wildlife and water quality, that could be covered by a general permit. Hopefully, such areas would be the wetlands which would return to upland without irrigation. Areas inside the wetland designation would require individual permits while areas in the general permit area would be conditioned to prevent tailings or materials likely to be a source of toxic materials to the water. City and county planners agreed to work out a system of notifying the Corps thru their review process when wetland permit problems become apparent.

In the specific instance of Gunnison County, it appears that there is really no practicable alternative to construction of housing developments in some of the irrigated wetlands.

The exact mechanism to accomplish this effort under the law has not been determined, but in discussion later in the day with county commissioners and the county attorney, the general consensus was that they could work within the legal framework of Section 404, if flexibility as described above is possible.

The meeting closed on a congenial note, and further meetings are expected. Most of the people upset by the first news article are calm and taking a wait and see attitude about what practical mechanism can be accomplished. However, many contacts were made to senatorial and congressional offices requesting that the law be changed. There are some attorneys preparing to pursue a law change.

APPENDIX C

EXAMPLES OF THE EFFECT OF WATER QUALITY STANDARDS ON WESTERN WATER

A GENERAL EXAMPLE

As a practical matter the standard-setting process has broken down -- at lease in the arid west -- because of the great frequency with which industries have been asked to install treatment systems that are "better" than what EPA has defined as being "best." At a minimum, this creates confusion and uncertainty and unreasonably increases the cost of compliance. At worst, it can lead to shutdowns and prevent industries from locating or expanding their operations in desirable areas.

This breakdown is the result of several practical problems in the way EPA and the states have implemented the standard-setting process. As a result of these problems, standard-setting agencies in the arid west tend to set ambitious goals that, more often than not, cannot be met though a reasonable level of control.

To better understand the problem, consider the following example. Suppose that State X has decided to establish water quality standards for all "navigable waters" within its borders. The first thing it will probably do is adopt "statewide" standards, applicable to all waters of the state. This was done by most states in the early and mid-1970's. The current impact of these standards is generally minor.

Next, the state will probably adopt a system for assigning more restrictive, site-specific standards.

For use classifications, the state will create a set of categories which describe beneficial uses of water, and which correspond more or less closely with identifiable criteria. Common examples are "water supply", "agriculture", "recreation", "aquatic life", etc. The state will also create a procedure for assigning these classifications.

For criteria, the state will probably adopt a table of maximum suggested pollutant levels for each standard use category. These criteria will be based on guidelines published by EPA pursuant to Section 304(a) of the Clean Water Act. The state will also sanction the adoption of less restrictive criteria (i.e., it will permit higher in-stream pollutant levels) if the designated uses are "in place", and "existing ambient conditions" support those uses. Having adopted this system, the state will begin the process of assigning standards to specific waters. First, it will probably subdivide the state geographically according to drainage basin. Next, it will assign a schedule for conducting standard-setting proceedings.

Suppose the state has elected to commence with the Y River Basin. It will first take a map of the basin and divide the

river and its tributaries into "segments", that is, areas designed to have a single set of standards. These are usually many miles long. Next, employees of the state will inspect each segment and propose classifications based on the uses they see in place, and any others that appear desirable according to local land use plans. Finally, they will propose numeric criteria to go along with the use designations. When this process has been completed for every segment in the basin, the state will propose the standards as an administrative rule.

For the purpose of this example, suppose that you are an industry located on a small tributary to the Y River. Let's assume that the tributary is about five miles long, and you are one of two industries discharging to this stretch of the stream. Upon reviewing the state's proposal you see that this segment (designated as Segment 4 of the Y River Basin) is to be classified as "Cold Water Aquatic Life -- Class I." Under the state's classifications scheme, this means that the stream should be capable of supporting a high quality cold water fishery. Upon reviewing the proposal further, you find that copper is the limiting parameter for this type of fishery. Thus, the state has proposed a numeric limit for copper of 0.005 mg/l. This is the "table number."

Upon completing your review, your first question is, "How will this proposal affect me?" After some reflection, you will probably conclude that you cannot tell. You know that the proposals might affect your ability to discharge copper, but you can't predict the likely extent of the effect. Under the best possible scenario, the proposal won't affect you at all, and your discharges of copper will be limited solely by BPT and BAT. Thus, for instance, if you are a mining company, your discharge will be able to contain 0.30 mg/l of copper as a daily maximum, and 0.15 mg/l as a 30-day average. Under the worst possible scenario, your discharge will only be able to contain 0.005 mg/l of copper -- sixty times more stringent than the daily maximum attainable with BAT.

In order to determine where in between these two extremes your discharge limit might fall, certain assumptions have to be made about available dilution flows, mixing zones, background loading from non-point sources, and allocation of the allowable daily waste load among the two point source dischargers. As a practical matter, these assumptions can only be determined after detailed negotiations with the state permit writer. However, upon calling the state, you discover that the permit writers won't be participating in this hearing -- the state's evidence will be limited to matters directly relating to ambient water quality, not the effect of the proposed standards on dis-

chargers. Furthermore, because of their busy schedule, the permit writers won't have time before the hearing to discuss the effect of the proposal on your discharge.

Placed in this situation, all you can do is assess the likely impact of alternate scenarios, i.e., what it might cost to meet different effluent limitations that might result from the proposal. Suppose you decide that certain scenarios will require the company to incur substantial additional expense. How do you oppose the proposal? The first thing you will probably do is conduct a review of uses on the stream -- in this case, the status of the aquatic life. You will probably find that the quality of this aquatic life is variable. For instance, a good fishery probably exists upstream of both discharges, but the diversity and population size declines noticeably in the vicinity of the first discharge. This fishery then recovers somewhat as you proceed downstream until you reach the second discharge, where very little aquatic life can be found. As you proceed further downstream to the end of the segment the fishery improves slightly, but it never attains the vigor of the upstream population.

Next, you will probably sample water quality at various points in the segment. It is likely that population levels will correlate inversely with the quality of the fishery -- i.e., copper will be low above both discharges, increase noticeably in the vicinity of the second discharge, and then recover slightly as you near the end of the segment.

In light of this evidence, you will probably argue that the proposed standard should be rejected because it fails to accurately reflect existing conditions, at least for the segment as a whole. However, this argument is almost sure to fail, for the following reasons:

1. The standard-setters will point out that a high quality fishery does, in fact, exist in some parts of the segment.

2. Based on this fact, they conclude that a high quality fishery could exist throughout the entire segment if it weren't for the two industrial discharges. In this regard, they interpret "existing ambient conditions" to refer not to the conditions that actually exist in the stream, but to conditions that <u>would</u> exist in the absence of man-made discharges.

20-955 O—84——29

3. In light of this situation, they conclude that the higher standard should be considered the "norm". (See 43 Fed. Reg. 29589, July 10, 1978). They suggest that they will adopt "relaxed" standards only if the higher standards are "unattainable" technically, or because they would lead to severe economic dislocation because of plant closures.

When you ask for the source of this latter policy, the standard setters will almost surely point to EPA's grant regulations, 40 CFR Part 35, and the process by which standards are reviewed by the agency. It is likely that the state water program is funded largely though EPA grants. Since implementation of EPA's "fishable, swimmable" policy has traditionally been a grant requirement, it is unlikely that the state will risk the loss of federal money by refusing to go along. This puts you in a dilemma. You probably can't prove that the standards are "unattainable," because you don't know the precise immpact they will have on your discharge permit. Furthermore, even if you could predict these impacts, it is unlikely you could show that the standards were "unattainable" -- it is more likely you would simply think them to be unreasonable. Thus, it is likely that the higher standard will be adopted.

Suppose the higher standard is, in fact, adopted. What happens next in the permit proceeding depends on the precise relationship between your discharge, other discharges, and streamflow conditions. If streamflows are typically high in relation to discharge flows, as they often are in wetter regions of the country, then the standards will have little or no impact. For instance, if the average flow of your discharge is 10 cfs, and the Y River rarely flows less than several hundred cfs, you discharge will be limited by BAT. However, receiving streams in the arid west generally suffer extended low flow periods. Thus, effluent limitations for major industries more often approach water quality standards than BAT guidelines.

What happens when a state proposes these low effluent limitations, which are generally beyond the discharger's existing treatment capacity? Section 302(b)(1)(C) of the Act suggests that if the limitations cannot be met, the source should be shut down. In a classic "Catch-22", economic issues generally cannot be raised during the permit process. The results are rarely so draconian, but they can nonetheless be costly. Generally, permit writers will devise a "compliance schedule" for meeting the water quality based limits. This can have one of two effects. If the discharger elects to go ahead and install the requisite treatment, he will retain his right to discharge, but he will have spent a lot of money in a manner that

is unlikely to be cost-effective. If the discharger decides that he can't meet the limits, then the dispute has only been delayed. Upon expiration of the schedule, the discharger must once again attempt to change the underlying standards, using new information he has generated during its term.

As noted above, it is not necessarily unreasonable to make dischargers comply with water quality based effluent limitations. Thus, compliance schedules aren't always objectionable. However, in the arid west, perhaps the majority of major industries are required to investigate the use of technologies that are "better" than "best". This practice is wasteful, and strongly suggests that economic and technical limitations are inadequately addressed in the standard-setting process.

TWO SPECIFIC EXAMPLES

A. Hecla Mining Company's Star Mine facility, Burke, Idaho (currently shut down), faced a problem in obtaining renewal of an NPDES permit where a variance had been requested for copper from water quality standards and BPT limitations. Although Hecla Mining Company followed all conditions prescribed in existing regulations, we were unable to achieve prescribed standards. EPA analyzed the data on copper within our effluent and concluded that there was substantial correlation to indicate the formation of a complex ion that could not be removed by normal precipitation practice. Although this complex was much less toxic than copper in the free form, EPA would not grant a variance from existing regulations. An adjudicatory hearing plagued Hecla for six years, until the Star Mine faced final closure. This strict adherence to arbitrary standards was a contributing factor in the closure of the Star Mine.

B. Waters emanating from Hecla Mining Company's Sherman Mine, Leadville, Colorado, consist of natural snowmelt. This water has been monitored since 1973, and meets Colorado drinking water standards, since the water is used as a source of public drinking water.

The Colorado Department of Health currently issued an NPDES permit using the receiving stream's water quality standards as permit parameters. These standards are approximately equivalent to detection limit values. Years of data indicate that the receiving stream will never meet these standards, yet Hecla Mining Company is forced to either comply with these arbitrarily set standards or litigate the case. Costs in either case are prohibitive for a mine that has been closed for one year due to economic hardships.

CASE STUDY OF PERMIT LIMITATIONS BASED ON WATER QUALITY STANDARDS

RICO PROJECT
January 1983

The Rico property was purchased by Anaconda Minerals in 1980 as an exploration site. A mine water discharge is associated with the site and is covered by a Colorado NPDES permit. The permit limitation for zinc was not being met. The permit in force at the time contained a zinc limit of 1.0 mg/l maximum and a 0.5 mg/l average. The State issued a Notice of Violation including a requirement that Anaconda Minerals submit a program to bring the discharge into compliance. Anaconda performed treatability studies and proceeded with conceptual design and detailed engineering for a water treatment plant. This NPDES permit expired on December 31, 1981; the new proposed permit (renewal) contained a water quality based standard for cadmium. Monitoring by Anaconda for silver and mercury was also proposed by the Agency for possible insertion of a permit limitation (at the Agency's discretion) for these metals at a later date. The proposed effluent limitations for each of these parameters are shown below:

Cadmium	0.0004 mg/l
Mercury	0.00005 mg/l
Silver	0.0001 mg/l

These limitations are based on calculations which assume that the maximum flow from the water treatment plant as designed will occur simultaneously with the minimum flow (Q7-10) in the Dolores River. Existing in-stream concentrations for the various parameters, which are the basis for the Agency's proposed effluent limitations, were obtained from a water quality survey performed by Anaconda.

Anaconda is presently attempting to negotiate changes in the proposed permit. Major points of discussion are:

- Permit does not consider <u>actual</u> flow conditions, i.e. ratio of flow from discharge vs. flow in the Dolores River (maximum mine discharge rate normally corresponds to maximum stream flow, rather than the opposite).
- Technology does not exist to achieve the removal required.
- Concentrations are at or below analytical detection limits.

It should be noted that aquatic insect studies show no impact of the existing discharge on the benthic community in the receiving stream. Since the water treatment plant will reduce the zinc concentration (which now reaches 6.0 mg/l on some occasions) in the effluent to less than 0.5 mg/l and should reduce the cadmium concentration by about 50%, any potential impact of the discharge on the river system should be reduced dramatically.

This is an existing discharge and through additional in-stream sampling and discussions, we may be able to reach agreement on a revised cadmium limitation; this is unlikely in the case of mercury and silver. If this were a new facility, this problem could prevent the project from being constructed.

A basic question is: Should a regulatory agency have the right to put into a permit effluent limitations which cannot be measured and which are not achievable by applicable treatment methodologies?

Also, should any company be required to spend well in excess of $1.0MM on a treatment facility knowing that the facility cannot meet all of the applicable effluent limitations and that the company will have to apply, soon after construction, for a variance for the new treatment facility?

Mr. ROE. Please proceed.

TESTIMONY OF DAVID DELCOUR, CHAIRMAN, CLEAN WATER AD HOC COMMITTEE, WESTERN REGIONAL COUNCIL

Mr. DELCOUR. Thank you, I will.

Mr. Chairman, my name is David Delcour. I am vice president of the Climax Molybdenum Co., a division of Amax, Inc. My testimony today, however, is in behalf of the Western Regional Council.

The Western Regional Council was organized to provide a unified voice for the business community of the Intermountain West. Its membership is composed of chief executive officers of corporations representing a number of major industries in the intermountain west. The organization seeks balanced policies which consider the benefits of both economic development and environmental protection.

The Western Regional Council has already submitted to the committee staff extensive testimony together with a rather lengthy position paper and case studies illustrating our concern and I appreciate your willingness to include that in the full record.

Mr. Chairman, water is a critical commodity in the West. Quantitative and qualitative water management is of significant importance to the Western Regional Council. We, therefore, support reauthorization of the Clean Water Act. In doing so, however, we urge several revisions to the act which, if adopted, will make it more responsive to certain unique features of western water. The intent of our recommendations is not to change the basic concepts of the act, but to provide the flexibility in implementation which is required for sound water management in the West.

Our written testimony addresses five areas in which we believe amendments to the act would be appropriate and helpful. Two of the proposals deal with section 404 of the act. Those two proposed

amendments seek to exclude intermittent streams from the definition of navigable waters and land temporarily saturated due to snowmelt runoff and irrigation from the definition of wetlands. In many parts of the arid west we have streambeds that only occasionally have water in them. They do not support fish or wildlife. Nor do they flow into other streams or provide water to downstream users. The same could be said for artificial and seasonal wetlands. The 404 permitting process ought not apply to these types of water. Court decisions however, have broadened section 404 to include regulation of intermittent streams and artifical and seasonal wetlands. To overcome this, some narrowing of the definition of "navigable water," found in section 502(7) of the act would be appropriate.

Of our remaining three proposals, two are rather easily stated and I will deal with them just very briefly.

We believe that storm water runoff devices should be excluded from the definition of point source contained in section 502(14) of the act in those cases where such runoff is uncontaminated. EPA has interpreted the definition of point source to include devices which gather, collect, or otherwise divert storm water runoff and snowmelt. Thus, naturally flowing surface runoff water becomes subject to the NPDES permit program. Defining such devices as point sources penalizes companies for installing devices which they were not required to install and which, in and of themselves, prevent or minimize pollution. Our full statement includes some brief examples demonstrating the need for the modification we propose to the point source definition.

Our next recommendation relates to the Clean Water Act's zero discharge goal. I do this with some trepidation because I know for many this is the keystone of the entire act.

Nevertheless, as the goal is being interpreted by at least one region of the EPA, some modification or clarification appears to be necessary. Specifically, the Western Regional Council recommends that the zero discharge goal be changed to read: "The discharge of pollutants in harmful quantities be eliminated by 1985." Arizona law, like that of most Western States, provide that the waters of the State are to be put to beneficial use within the State and become return flows to the waters of the State and subsequently reused. Rules and regulations shall not diminish the water available for such beneficial uses nor deprive the State of such water. EPA's region 9 office has cited this provision of Arizona law as a basis for refusing to delegate the NPDES permit program to the State. While we are not aware of any other EPA region taking a similar view of the existing act, we do believe the matter is sufficiently serious to be addressed in Clean Water Act amendments.

At the very least we would suggest clarifying report language of the sort recently agreed to by your counterparts in the Senate.

Our final proposed amendment deals with a considerably more complicated aspect of the Clean Water Act, the effect of water quality standards on western water. Water quality standards are generally more stringent than technology based effluent limitation guidelines, either BPT or BAT. In wetter regions of the country this disparity has little or no practical regulatory effect since high stream flows generally dilute the technology limited discharges to

meet the receiving water quality standards. Unfortunately, in perhaps the majority of cases in the arid West, and because of low natural flows, industrial dischargers are asked to install treatment systems that are better than what EPA has defined as being best. At a minimum, this creates confusion and uncertainty and unreasonably increases the cost of compliance. At worst, it can lead to shutdowns and prevent industries from locating or expanding their operations in desirable areas. To remedy this situation, the Western Regional Council believes that in considering NPDES permit applications, where treatment beyond BAT is to be required, States should be allowed to consider economic issues without running the risk of EPA disapproval. At the present time, EPA disapproval under these circumstances would be almost a foregone conclusion under the theory that a water quality limited permit which considered economic factors would not meet the minimum requirements of the act as required by section 402(A). While current law does allow economic factors to be considered in the setting of water quality standards, adequate information invariably will not be available until the impact of the standard is reflected in a proposed permit. Then, it is too late to consider economic factors. One way to deal with this problem, and I am sure there are others, would be to amend section 302 of the act.

That section already requires the EPA Administrator to consider economic costs and benefits in the imposition of effluent limitations more stringent than BAT. By amending section 302 to require a similar review for all water quality based effluent limitations when treatment beyond BAT is to be required, whether imposed by EPA or by a State under section 301, we believe the catch-22 which I have briefly described, and which is more fully described in our position paper, could be eliminated. The approach we have suggested has the additional advantage of avoiding the emotionally charged debate on the question of downgrading water quality standards.

Mr. Chairman, this concludes a summary of my testimony.

I appreciate your consideration for the points we have to make.

Mr. ROE. I want to thank the gentleman for his comprehensive testimony and we will look into what you have, you know, your paper has developed.

I have read part of it myself.

Are there any questions for the gentleman?

The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Delcour, your first suggested change related to the definition of "point-source" addresses devices that merely divert, gather, or collect storm water runoff or snowmelt.

On page 3 you give three brief examples to illustrate the need for amending the definition.

For each of these examples, could you please describe the physical characteristics of the diversion and diversionary structures that you mentioned?

Are they dams, levees?

Mr. DELCOUR. I have not seen these particular Hecla Mining Co. facilities described. I am familiar generally with the types of structures and typically we are talking about a system of canals built above an industrial property such as a mine or mine tailing im-

poundment area, which take the natural snowmelt runoff, bring it around the industrial property, prevent that water from coming in contact with the process water and discharge it into the stream below the industrial site.

Mr. STANGELAND. On page 3 you also mentioned regulatory bodies are interpreting the act's zero discharge goal literally to mean that all discharges must be eliminated by 1985 regardless of quality.

Could you please expand on this statement a little more fully?

Mr. DELCOUR. Well, that is reference to EPA region 9's refusal to permit the State of Arizona to administer the NPDES program in that State.

Mr. STANGELAND. Is it just Arizona or just region 9?

Mr. DELCOUR. In region 8 this view has not been taken. Among the States in which Western Regional Council members operate, Arizona is the only State in region 9. I cannot speak to other parts of the country, I am sorry.

Mr. STANGELAND. Your third change suggests a change involves amending the definition of navigable waters.

You mention normally dry arroyos and desert playas as being examples of water bodies that should not be included in the definition.

What environmental values do these arroyos and/or playas have and to what extent does water collect in these water bodies recharge or resupply ground water or aquifers?

Mr. DELCOUR. I am not sure I'm capable of answering the question on recharge. I would be happy to try to develop some information on that and provide it to you within the next few days.

Mr. STANGELAND. For the record, that would be fine.

[The information requested is incurred in Mr. Delcour's supplement, see question 3, p. 447.]

Mr. STANGELAND. Your fifth proposal relating to water quality standards suggests that the standard-setting process should involve illustrations of technical and economic feasibility. On page 9 you state that, in order to remedy this, industries and the State need this to be allowed to consider economic issues to the permitting process without EPA disapproving such permits strictly on the basis of the zero discharge, and fishable, swimable goals of the act.

Now, how in your view would EPA and the State go about implementing the suggestion and at what point in the standard-setting process should considerations of technical and economic feasibility be considered?

Mr. DELCOUR. They are presently considered in the standard-setting process. The problem is that when standards are set, when a State regulatory body goes through a rulemaking procedure, it does not have information available to it to thoroughly evaluate the economic consequences. It is only when water quality based limits are backed into new permits, that the economic impact can be evaluated. The problem is at that time, the economic factors may not be considered and that is where we believe they should be considered, but may not be under current law.

Mr. STANGELAND. Now, the act's current fishable, swimable goal is not an absolute but rather one which is to be achieved wherever attainable.

Why is not this language sufficient to enable the agency to adequately consider economic and technical feasibility questions in the standard-setting and permit-issuing processes?

Mr. DELCOUR. I do not know.

I do know that the agency argues that it may not do that.

Mr. STANGELAND. You may want to consider that and expand on it for the record.

In fact, Mr. Chairman, we might want to submit the questions to the gentleman for his perusal and then respond through writing.

[The information is included in Mr. Delcours' supplement, see p. 445.]

Mr. ROE. Yes, I was going to suggest that it would be a good idea because I think you're making a couple of telling points here that we ought to get into, particularly when they are not point source issues.

So if you would submit that to us we will take another look at those items.

Mr. DELCOUR. We will be happy to do that.

Mr. ROE. Are there any other questions for the gentleman?

We want to thank you very much for your substantive testimony. We appreciate your taking the time to be with us this morning.

[The following was received from Mr. Delcour:]

QUESTIONS AND ANSWERS FOR WATER RESOURCES SUBCOMMITTEE

FROM: DAVID W. DELCOUR, CHAIRMAN
WESTERN STATES WATER COUNCIL
WATER COMMITTEE

Q. Mr. Delcour, your first suggested change relating to the definition of "point source" addresses devices that merely divert, gather and collect storm water runoff or snowmelt. On Page 3 you give three brief examples meant to illustrate the need for amending the definition. For each of these examples, would you please describe the physical characteristics of the "diversion" and "diversionary structures" that you mention?

A. Mining facilities are located in different terrain therefore requiring varying designs for site and tailing pond structures. Generally, however, mines located in narrow mountain valleys where large snowfalls occur, experience major water runoff in Spring and early Summer Mine operators often voluntarily construct diversion structures around the mine site and tailings ponds to prevent large amounts of nonpoint source water from running through the mine processing area and tailings. In some cases, states have required the diversion structures. (See example No. 2 below.) These diversions are often pipes, ditches or cement lined byways which carry only natural or nonprocess water. They are not impoundments that collect and store water but merely channel natural flows away from the mine site. In the case of a narrow, steep incline the diversion site uphill from the mine facility or in more level terrain, is on the outside perimeter of the site. The runoff water is normally discharged in the stream below the facility or may parallel a road, to prevent erosion, and be discharged at a further downstream point. The diversion serves two purposes; it keeps the facility from being flooded at high water stages and it prevents the contamination of natural runoff with process mine water. It is a preventive, often voluntary measure that does not warrant an NPDES permit.

Physical Characteristics of Each Diversion

A. Hecla's Lucky Friday No. 3 - The mine and mill tailings are situated in a narrow mountain valley. The interstate highway drops from the top of the pass, and is located above the Lucky Friday tailing pond. The State of Idaho has constructed a ditch above the highway to collect and divert runoff and to prevent erosion; the ditch drains into the creek miles below. Similar to the State, Hecla has constructed a ditch below the highway but above the tailings pond. Both diversions were constructed for the same

purpose. Hecla's, however, is considered a point source discharge so an NPDES permit is required.

B. Republic Mine, Washington - The State is requiring the Company to construct diversion ditches and a concrete spillway to accommodate the 10 day, 24 hour maximum flood requirements. The diversion redirects water above and around the surface impoundment where it is discharged through the spillway to the stream.

C. The Sherman Mine, Leadville, Colorado - Large amounts of snowmelt runoff flow above the mine through a talus slope, which is natural rock debris at base of cliffs. The water continues through the mine, into a 36" galvanized pipe which carries it through the tailings pond and into other talus slopes below. It eventually flows into the Arkansas River. The State has required an NPDES for the discharge of this natural runoff water.

Q. On Page 3 of your statement, you mention that regulatory bodies are interpreting the Act's zero discharge goal literally to mean that all discharges must be eliminated by 1985 regardless of quality. Could you please expand on this statement a little more fully? What regulatory bodies are you referring to? Do you have additional examples beyond the one provided on Page 4 further describing the situation that you feel needs to be addressed?

A. EPA has questioned several western states regarding their ability to administer the NPDES program in light of their state water laws. Most water short Rocky Mountain state statutes are based on the principle of diverting water from streams for beneficial uses, i.e., irrigation, industrial processes, power generation, and require that water be returned to the stream for downstream uses. This appropriation system of obtaining a right to use water is a policy concern to EPA. They believe it conflicts with the zero discharge goals of the Clean Water Act if an NPDES permit or any other requirement to diminish flow is required.

Enclosed is a letter from David Jones, Regional EPA, San Francisco, which states that one of the reasons Arizona can not receive NPDES program jurisdiction is the "prohibition of zero discharge" requirements found in the Arizona State water statutes. The State of Colorado has received a letter from Region 10 expressing the same interpretation of state water law vs. the Clean Water Act's zero discharge goal.

If such goals or policies are interpreted literally, major conflicts will undoubtedly occur and the efforts of the states and EPA to continue the progress made in cleaning up and protecting the nation's waters will be impeded. WRC suggests that resolution of such conflicts can best be addressed in the context of specific permit proceedings which take into account individual circumstances that may vary widely.

Report language has been included in the Senate Report 98-233 to this effect, page 4, the language referring to Section 101(g).

Q. Your third suggested change to the Act involves amending the definition of navigable waters. You mention "normally dry arroyos" and "desert playas" as being examples of water bodies that should not be included in the Act's definition. What environmental values do these arroyos and/or playas have? To what extent does water that collects in these water bodies recharge or resupply groundwater aquifers?

A. By definition, arroyos and playas typically do not recharge acquifers.

Geologically, arroyos are the physical channels of an ephemeral stream in the semi-arid west. The stream flows from direct precipitation and has no long-continued supply. Therefore it is not considered a supply or recharge source for groundwater.

Similarly, playas are desert lakes, ephemeral in nature. They are dried, arid, clay layered depressions on beds at the lowest point of a given desert area. As such, they are impermeable and precipitation evaporates rather than feeding into the groundwater. Often times, such desert "intermittent" lakes are saline as a result of the salt deposited from years of evaporation in the lake bed. They are rarely potable.

(See WRC testimony Appendix A, for a more detailed description of the arroyos and playas.)

Q. Your fifth proposal relating to water quality standards suggests that the standard-setting process should involve considerations of technical and economic feasibility. On Page 9, you state that "in order to remedy this, industries and the states need to be allowed to consider economic issues to the permitting process without EPA disapproving such permits strictly on the basis of the zero discharge and fishable/swimmable goals of the Act". How, in your view,

would EPA and/or the state go about implementing this suggestion? At what point in the standard-setting process should considerations of technical and economic feasibility be considered?

A. WRC has specific suggestions on how the "catch 22" dilema of economic considerations in water quality based permits can be remedied. Three points are important in order to understand the WRC recommendations.

1) The problem lies in the stringent water quality based effluent limits - limits required in permits more stringent than BAT.

2) Even though some economic considerations are allowed in the standard setting process under Section 303, the economic test is not adequate to allow downgrading - one way of reducing effluent limits in a water quality based permit.

3) Once standards are set, the law does not allow economics to be considered at the permit stage - yet this is the only stage where an applicant and EPA can determine what the technology requirements and the costs will be to meet the effluent limits established for that facility in the permit.

WRC recommends one method of solving the problem; amend Section 302 to allow the states to use the already established cost-benefit test at the permitting stage for all water quality based permits.

Section 302 already allows the Administrator to set effluent limits that "reflect a reasonable relationship between the economic and social costs and benefits to be attained." While this allows an applicant to have economics considered in his permit, it has two serious flaws.

1) No Administrator has used Section 302 and there is no ability for the states to use it even though they have been delegated the permitting authority under the Act.

2) The economic test only applies to effluent limits established by the Administrator, not those established by the states under Section 303.

Since Congress required that economics should be considered at the permitting stage if effluent limits are water quality based, it is logical to allow the state to consider economics in the permit process when the same conditions exist. EPA still retains permit veto power under Section 402(d).

WRC recommends the following amendment to Section 302 which extends the provisions to state established water quality based effluent limits.

Amend Section 302(a) to read as follows:

Whenever, in the judgment of the Administrator **or a state water pollution control agency**, discharges of pollutants from a point source or group of point sources, with the application of effluent limitations required under section 301(b)(2) of this Act, would interfere with the attainment or maintenance of **water quality standards adopted pursuant to Section 303 of this Act,...** effluent limitations (including alternative effluent control strategies) for such point source or sources shall be established which can be reasonably expected to contribute to the attainment or maintenance of such water quality.*

Amend Section 302(b) to read as follows:

(1) Prior to establishment of any effluent limitation pursuant to subsection (a) of this section, the Administrator **or the state agency proposing to adopt the effluent limitation** shall issue notice of intent to establish such limitation and within ninety days of such notice hold a public hearing to determine the relationship of the economic and social costs of achieving any such limitation or limitations, including any economic or social dislocation in the affected community or communities, to the social and economic benefits to be obtained (including the attainment of the objective of this Act) and to determine whether or not such effluent limitations can be implemented with available technology or other alternative control strategies.

(2) If a person affected by such limitation demonstrates at such hearing that (whether or not such technology or other alternative control strategies are available) there is no reasonable relationship between the economic and social costs and the benefits to be obtained (including attainment of the objective of this Act), such limitation shall not become effective and the Administrator **or the state agency proposing to adopt the effluent limitation** shall adjust such limitation as it applies to such person.

Amend Section 301(b)(1)(c) to read as follows:

(C) not later than July 1, 1977, any more stringent limitation, including those necessary to meet the requirements of section 302, treatment standards, or schedule of compliance, established pursuant to any State law or regulations, (under authority preserved by section 510) or any other Federal law or regulation, or required to implement any applicable water quality standard established pursuant to this Act.

It should be noted, however, that the recently passed Senate Bill, S. 431 (S.R. 98-233), amends Section 302 to read as follows:

Sec. 302.(a) Whenever, in the judgment of the Administrator, or as identified under section 305(c) discharges of pollutants from a point source or group of point sources, with the application of effluent limitations required under section 301(b)(2) of this Act, would interfere with the attainment or maintenance of that water quality in a specific portion of the navigable waters which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water, effluent limitations (including alternative effluent control strategies) for such point source or sources shall be established which can reasonably be expected to contribute to the attainment or maintenance of such water quality.

(b)(1) Prior to establishment of any effluent limitation pursuant to subsection (a) of this section, the Administrator shall publish such proposed limitation and within ninety days of such publication hold a public hearing.

(2)(A) The Administrator, with the concurrence of the State, may issue a permit which modifies the effluent limitations required by subsection (a) of this section for pollutants other than toxic pollutants, if the applicant demonstrates at such hearing that (whether or not technology or other alternative control strategies are available) there is reasonable relationship

between the economic and social costs and the benefits to be obtained (including attainment of the objective of this Act) from achieving such limitation.

(B) The Administrator, with the concurrence of the State, may issue a permit which modifies the effluent limitations required by subsection (a) of this section for toxic pollutants for a single period not to exceed five years, if the applicant demonstrates to the satisfaction of the Administrator that such modified requirements (1) will represent the maximum degree of control within the economic capability of the owner and operator of the source, and (2) will result in reasonable further progress beyond the requirements of section 301(b)(2) toward the requirements of subsection (a) of this section.

This change limits the existing statute and for two reasons does not accomplish WRCs objectives.

First, it does not grant the states the ability to use Section 302. Furthermore, it limits permits that have toxic pollutant effluent limits to only a single five-year exemption. For mining facilities, permits contain effluent limits for metals which are considered toxic under Section 307 of the Clean Water Act regardless of the concentration. The Senate action makes Section 302 effectively off limits to western businesses located in mountain areas where natural background levels are higher in mineral content. These are areas where higher quality streams are located and likely to be required to treat beyond BAT. Furthermore, the language is inconsistent with Section 101(a)(3), the goal settings section, where it is the "national policy that toxic pollutants are to be eliminated in toxic amounts."

WRC suggests the Senate language be amended as follows to remain consistent with the Act:

1. Amend Section 6(e)(2) of S. 431 (Senate Report 98-233) to read as follows:

   Section 302(b) of the Clean Water Act is amended to read as follows:

   "(b)(1) Prior to establishment of any effluent limitation pursuant to subsection (a) of this section, the Administrator shall publish such proposed limitation and within ninety days of such publication hold a public hearing.

(1)(A) The Administrator, with the concurrence of the State, may issue a permit which modifies the effluent limitations required by subsection (a) of this section ... if the applicant demonstrates that TOXIC POLLUTANTS WILL NOT BE DISCHARGED IN TOXIC AMOUNTS, and (whether or not technology or other alternative control strategies are available) there is no reasonable relationship between the economic and social costs and the benefits to be .... ATTAINED (including attainment of the objective of this Act) from achieving such limitation.

(B) ...(unchanged) ....

Q. The Act's current fishable/swimmable goal is not an absolute goal, but rather one which is to be achieved "wherever attainable". Why isn't this language sufficient to enable the agency to adequately consider economic and technical feasibility questions in the standard-setting and permit-issuing processes?

A. The Act's current fishable/swimmable goal, should not be an absolute, but is treated as such by EPA when applied to water quality standard effluent limits. For example, see 40 C.F.R. Section 35.1550(c)(1). The regulations should allow for flexibility in both water quality standard setting and in the permitting process to reflect attainment toward the goal, not absolute adherence to it if it is not cost-effective. It is even more critical that this flexibility exists in determining the cost-effectiveness of effluent limits when many streams have been overclassified as to their stream quality.

To obtain a NPDES permit, an applicant will have an inordinately high cost of compliance and/or the technology will not be available to treat to the levels required. Even though the stream may already be fishable/swimmable, the stringent standard still must be met. A similar applicant on an adjacent stream may be able to meet the requirements because the stream was classified correctly in the first place. Either the high quality nonexisting stream classifications should be treated as goals rather than set standards, or all streams should be designated at existing quality levels with reasonable standards to improve the quality as technology and economics dictate.

[illegible]
215 Fremont Street
San Francisco, Ca. 94105

Nov. 13, 1982

Ron Miller
Bureau of Water Quality Control
1740 West Adams Street
Phoenix, AZ 85007

Dear Ron:

On September 15, 1982, we sent you a draft Regional Counsel memorandum dated September 9, 1982 written by Ann Nutt regarding an analysis of the inadequacy of the Arizona Revised Statutes (A.R.S.) for purposes of the NPDES delegation. Also included was a draft memorandum dated August 20, 1982 by legal intern Robert Shives, Jr. on the inadequacies for purposes of NPDES delegation of both the Arizona Revised Statutes and the Arizona proposed Chapter 20 regulations. As these memos indicate, the NPDES program could not be delegated to Arizona under existing statutes. From discussions with you and your staff we understand that you are preparing proposed statutory changes for introduction as new legislation. While these proposed statutory amendments are being prepared, I thought it would be useful to summarize those areas of inadequacy which would need to be remedied before the NPDES program could be delegated.

There are five areas that are obstacles to delegation. The first obstacle is the definition of pollutant found in A.R.S. §36-185(11). It is inadequate because it doesn't provide for a determination by the State that an injection will not degrade surface or groundwater and therefore the exclusion provided is too broad.

The second obstacle is the prohibition of "zero discharge" requirements found in A.R.S. §36-1854(B) and A.R.S. §36-1859(C). These provisions are inadequate because they prohibit any requirement which would have the effect of even slightly diminishing return flow or issuing permits which would have that effect.

The third obstacle is the conflict of interest provision for the body which approves the NPDES permit found in A.R.S. §361859(A). It is inadequate because EPA regulation 40 CFR §123.7(e) requires an explicit confict of interest provision which would provide that the board, body or individual which approves all or portions of NPDES permits issued by the State does not include anyone who receives or during the two previous years has received a significant portion of income directly or indirectly from permit holders or applicants.

The fourth obstacle is the lack of authority to enjoin permit violations which is evidenced in A.R.S. §36-1864. This provision is inadequate as EPA regulation 40 CFR §123.9(a)(2) requires that permit violations be able to be enjoined and as the A.R.S. now reads, only orders of the council or director may be enjoined.

The fifth obstacle is the provison for criminal penalties found in A.R.S. 36-1864.02. It is inadequate because criminal penalties are specified by 40 CFR §123.9(a) (3)(iii)(B) as a minimum of $10,000 per day for each violation. Arizona presently provides a maximum fine of either $1000 for Class I misdemeanors or $750 for Class II misdemeanors.

These obstacles represent the minimum statutory changes which are needed before NPDES delegation can occur. If there are any other provisions of the statutes which to your knowledge when read in conjunction with the above mentioned obstacles would remove the inadequacy, please let us know and we will be glad to convey the information to our office of Regional Counsel for an interpretation of the provision. I hope this nutshell overview is helpful to you in working with your legal staff to draft proposed statutory language.

Sincerely,

Dave Jones, Chief
Arizona, Hawaii, Nevada Branch

Mr. ROE. If there are no further witnesses this morning, the committee will now recess until Thursday at 10 o'clock, to continue the hearings.

[The subcommittee recessed at 12:46 p.m.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, SEPTEMBER 22, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 10 a.m. in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

The Subcommittee on Water Resources will come to order. We will continue with our hearings on our clean water bill and water pollution control legislation.

We are honored to have as our leadoff witness, Hon. Pete Wilson, U.S. Senator from California, together with his colleague in the House, Duncan Hunter, who also represents California.

I believe you have with you Mr. Richard King, director of the San Diego Water Utilities Department and William Harrington, Washington representative, San Diego.

Before I defer to the gentleman from California, let me thank you for joining us so early. There are about six different meetings going on at the same time. I know you have been a real champion in the field of environment and clean water and clean air, Senator, and we want to welcome you here.

Duncan has been a strong force in the House here, so we are glad to get to start off with people who are so interested in this area and we are looking forward to your testimony, and you would, I hope, introduce the gentleman with you.

I defer to the gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

I, too, am delighted to have Senator Wilson who has been deeply involved in this problem for years and years as former mayor of the city of San Diego. That city receives the greatest impact from pollution problems that exist in the border area between Tijuana and San Diego.

So his familiarity with it is so valuable to this committee. I personally am grateful that he arranged his schedule to permit him to testify before us this morning.

I don't believe there is a more serious pollution problem in the country than that particular area. I hope that the committee will find the testimony of both Senator Wilson and of course my col-

league, Duncan Hunter, who represents the area that also is as impacted as anyplace with the problem.

We are grateful to have them here. I personally am pleased to have them present their testimony and it is my pleasure to introduce Pete Wilson, our Senator from California, who has served in the San Diego area for many, many years, and Duncan Hunter, Congressman from the San Diego area that has served here for several years now, and Mr. King, and Mr. Harrington.

Thank you very much.

Mr. ROE. Senator, you are recognized.

The full text of your prepared statements will appear in the record at this point.

[Prepared statements referred to follow:]

PREPARED STATEMENT OF SENATOR PETE WILSON

Good morning, Mr. Chairman and members of the committee, with me today is Mr. Richard King, Water Utilities Director for the City of San Diego, and Mr. William Harrington, San Diego's Washington Representative. I wish to express my appreciation for this opportunity to speak on a matter of great importance to San Diego. The record of your committee is one of long-standing foresight and determination in dealing positively with matters of water pollution. We trust, after you have heard our description of a situation which EPA officials identify as the most serious water pollution problem in Federal Region IX, a four state area, that you will be compelled to act favorabley towards San Diego's plea. We seek relief from a major uncontrolled source of pollution which is a daily hazard to the health and the environment of San Diego's citizens.

Mr. Chairman, San Diego is located in the most southwestern part of the United States. Its southern corporate boundary is coterminous with the California-Mexico border. Directly south of San Diego lies Tijuana, Mexico, whose northern limits are likewise coterminous with the international line. Since the 1930's Tijuana has grown from a small frontier outpost into a commercial/residential city of approximately one million inhabitants. And, becaue economic opportunity is greater in proximity to the United States than in Mexico's interior, its population is expected to more than double in the next twenty years.

Tijuana is well known throughout the western United States and Canada for its colorful sporting events, its cultural and scenic attractions and its international shopping plazas. Yearly, for these and other reasons, the Tijuana-San Diego border is the most crossed border in the world.

What is not as well know about Tijuana is that this city, approximately equal in population to the seventh largest city in the United States, has neither a reliable sewage collection system nor a sewage treatment facility. Moreover, only about 50 percent of Tijuana's population is, or can be, currently connected to the city sewage system. The balance either use septic tanks or have no system of sewage disposal at all. Yet, dispite this lack of connections, Tijuana's system currently collects 20 million gallons per day (MGD) of sewage. A combination of anticipated population increase, future construction of additional collection lines, and an increased water supply from the Colorado River could triple this current volume by the end of the century. To make matters worse, it is not unusual for Tijuana's sewage collection and disposal system to fail completely. Not for hours, not for days, not even for months, but for years at a time. It is a matter of fact that San Diego has been receiving and disposing of Tijuana's sewage each day for the past three years because of such a system failure.

You may wonder why we concern ourselves with the condition of a foreign city's sewers. Quite simply ladies and gentlemen, because San Diego is at a lower geographical elevation than Tijuana. In addition, for a good part of each year, the Pacific Ocean currents flow northward along the Mexican coastline to California shores. Be assured, Mr. Chairman, were it not for these facts of municipal infrastructure and geography, Mexican sawege would be of no importance to San Diego. But these facts are inescapable. And their consequence is millions of gallons of raw sewage pouring daily, uncontrolled, across the border from Mexico to pollute and contaminate nearby U.S. valleys, streams and seashores.

For half a century, federal, state and local agencies have struggled with this problem. Just last month, Mexican President Miguel de la Madrid, visiting Baja Califor-

nia Norte for the first time since taking office, announced plans for the construction of a sewage system that would help prevent (rather than simply prevent) pollution of the coastline on both sides of the border. de la Madrid's secretary of urban development and ecology announced, during the same visit, that the Mexican government had budgeted (not appropriated) funds to begin construction of the planned sewage system. Another advisor to de la Madrid said the president was declaring his administration's intention to develop a sewage system. Regretfully, this rhetoric is familiar to San Diegans. American presidents have repeatedly urged Mexican presidents to resolve this historic problem. The State Department has worked diligently with the Mexican foreign ministry to execute agreements which will mitigate the pollution hazard. Yet, despite long-term efforts by both countries, the problem only increases in severity. And candidly Mr. Chairman, the citizens of San Diego and its nearby communities who are forced to live daily with the pollution which follows from Mexico, grow impatient with the diplomatic pace of the search for a permanent solution.

San Diego is convinced that if this problem is to be solved, the initiative must come from the American side of the border. We also believe that the control of pollution which emanates from Mexico is the responsibility of the United States. For these reasons we appear before you today to state our case and ask for your advice and assistance.

First, the background of our request: since the 1930's San Diego and its environs have suffered pollution from Tijuana sewage. During the early years the Mexicans built "band-aid" facilities which were eventually overwhelmed by increasing demands. In 1965 the latest "band-aid" effort took the form of a service agreement between the United States and Mexico. The two nations agreed that the City of San Diego would accept domestic sewage from Tijuana into the City's Metropolitan Sewer System (Metro) under emergency conditions. The reason for this pact was to avert serious health and environmental problems in both countries due to the discharge of large quantities of Mexican sewage in the two border communities or into the Pacific Ocean near the international boundary.

During the first ten years San Diego treated Mexican sewage on an average of 26 days per year. However, in the mid-seventies the usage increased dramatically. In 1976 Tijuana sewage was treated 90 days and rose to 253 days in 1978. For the past three years San Diego has treated Mexican sewage for 365 days each year. In effect, there has been, and is, a permanent emergency in the Tijuana sewage system. As a consequence, San Diego is collecting, treating and disposing of 80 percent of Tijuana's daily sewage load on a continuing basis.

Consider that if Tijuana's system were fully operational, it would pump 20 MGD of raw sewage across the beach and into the Pacific Ocean surf a few miles south of the border. The local U.S. shoreline has been spared the pollution and contamination which surely would result from the discharge of such enormous quantities of untreated sewage into the surf only because of Tijuana's permanent "emergency". Under this emergency condition, San Diego, because of contractual obligations and self-interest, receives approximately 15 MGD of Mexican sewage daily for treatment and disposal. Tijuana pumps the balance of its daily sewage load, 5 MGD, across the beach and into the ocean a short distance below the border. And believe me, it is not difficult to locate the discharge point on the Tijuana coastline. This joint effort constitutes Tijuana's present emergency sewage disposal system.

When Tijuana cannot pump its daily 5 MGD into the surf because of the total failure of its system, or because of breaks in its collector system, the 5 MGD, following elevation contours, flows into the Tijuana River Valley on the U.S. side of the border contaminating and polluting farm acreage there. Sewage also flows into the Tijuana Valley River, which carriers it to the ocean, contaminating U.S. valley waterways along the way. For part of the year, ocean currents carry this raw sewage northward fouling our shorelines.

Mexico's response to this problem has been to commence construction of a larger pumping plant, a force main and a conduit system which will carry all of Tijuana's sewage (20 MGD) to the present ocean discharge point. Work on the pumping plant was halted last year due to a peso devaluation and a change of national administration. It is approximately 50 percent complete. Work continued on the force main and conduit system and it is nearly complete. But of course, without the new pumping station the other work is virtually useless. And it is uncertain when work on the pumping plant will be complete. In the meantime, depending on the condition of the Tijuana disposal system, raw sewage is either being pumped into the surf at the border, contaminating north and south coastlines, or flowing into the Tijuana Valley and its water courses to contaminate the valley lands and the shoreline at the valley mouth.

Mexico speaks of a future system which will carry sewage from Tijuana to a treatment facility to be built approximately 18 miles south of Tijuana. It is said that in addition to eliminating the present pollution problem, this facility will also reclaim sewage for agricultural uses. Unfortunately, Mexico cannot say when this facility will be operational. In sum Mr. Chairman, we are not optimistic about a timely Mexican solution to the pollution problem.

Mr. Chairman, the last band-aid has been applied and the patient is bleeding to death. San Diego has concluded that the tourniquet must be the construction of an international sewage treatment and disposal facility on the United States side of the border which will be capable of accepting Mexican sewage. We are joined and supported in this conclusion by the United States Environmental Protection Agency and the State of California. As a first step towards this goal, these bodies have requested San Diego to study treatment and disposal facility alternatives capable of processing sewage loads generated on both sides of the border. This study is underway and is slated for completion by the end of this year. While the conclusions of this report cannot be known at this time, present circumstances foretell the likelihood of an American facility utilizing conventional treatment, and discharging effluent into the Pacific Ocean through an outfall. The cost of this facility will depend upon such variables as its location, capacity, and methods of treatment and disposal. The optimum combination of these variables will be the subject of conclusions of the facility study. In 1981 this committee approved a San Diego proposal, sponsored by Mr. Anderson, for an I and A research demonstration. As a result, San Diego has become a leader in the development and testing of vascular plant technology as an innovative and alternative method of sewage treatment. If our testing proves that this is an appropriate technology for the treatment and reclamation of sewage, San Diego would seek eventually to integrate this process into the border facility.

If the international facility we have described is the permanent solution to the problem, and we have no reason presently to think it is not, then the next question to be answered concerns the most expeditious method of getting it built. Quite clearly San Diego is in the midst of a water pollution emergency. Normally, the construction of a treatment facility such as I have described would require eight to ten years. Obviously, not a quick response to a health and environmental crisis. This time line must be compressed. To do so we would suggest the establishment of a set of procedures unique to this international project. Essentially, these procedures would modify, on a one-time-only basis, existing law to the extent that the various federal approvals necessary for the projects' construction could be "fast-tracked." This concept has been discussed with the EPA, and it has indicated a willingess to cooperate provided Congress approves. Let me hasten to add that we do not mean to imply any disregard for existing environmental protection law. The only disregard we harbor is for the prospect of living with pollution for another ten years. We ask that the federal government yield to a degree which will allow us to solve the problem in a timely fashion.

The cost of constructing this facility will be substantial. Exactly how much will depend upon final design decisions. In the absence of that data, and in the interest of moving ahead, we would propose the authorization of an appropriation sufficient to cover the acquisition of the facility site and the preliminary engineering expenses. This would be a relatively modest amount. As the details of the project unfold San Diego could reappear before this Committee to report progress and request additional authorization for final design and construction funding.

Finally, we would like to comment on a point related to the American and Mexican cooperation necessary for long-term actions to develop and maintain a pollution free transborder area. The United States-Mexico agreement on "Cooperation for the Protection and Improvement of the Environment in the Border Area," recently signed by Presidents Reagan and de la Madrid, is a necessary first step to long-term cooperation between the nations. San Diego applauds the efforts of the State Department negotiating team which produced this remarkable document. This agreement is intended to be the framework to which subsequent "Annexes" will be appended identifying program priorities and defining cooperative approaches to immediate and long-term border sanitation concerns. We would hope that in the drafting of the sanitation annex, consideration will be given by the United States to a binational plan of mutually beneficial and contingent actions which will ultimately result in Mexico having full responsibility for all of its sewage.

Mr. Chairman, thank you for your courtesy in listening to San Diego's petition. It has been a pleasure appearing before you. I would be happy to answer any questions you or any of the members of your committee may have on this presentation.

PREPARED STATEMENT OF REPRESENTATIVE DUNCAN HUNTER OF CALIFORNIA

Mr. Chairman and members of the subcommittee, I want to thank you for the opportunity to testify today on an issue of utmost importance to not only the citizens of San Diego, but the citizens of Imperial County. For years, the Mexicans have dumped raw sewage and toxic chemicals into the Tia Juana and New Rivers creating a major health threat for the people along these Rivers. I appreciate being able to bring this matter to the Subcommittee's attention.

As Senator Wilson has stated, the sewage problem in Tijuana is very serious and the Senator's description of the sewage system in Tijuana accurately describes the present and future problems the San Diego area faces if we do not come up with a solution to treating this sewage. The people of San Diego and Imperial County have lived with this health threat for decades and I would like to emphasize the economic aspects and personal sufferings that are involved in this age-old problem.

As you may know, Imperial Beach, California lies at the mouth of the Tia Juana River. This community relies heavily on tourism to support its economy. Through the years the City of Imperial Beach has been plagued by the periodic quarantine of its beaches due to discharges of raw sewage from the Tia Juana River onto its beaches. Recently, however, this problem reached alarming proportions when releases from the Rodriguez Dam were increased, causing the Tia Juana River to flush even larger amounts of raw sewage into the ocean and onto Imperial Beach. For well over a month, Imperial Beach and several beaches to the north, remained quarantined due to a bacteria count 10 times the level considered safe for humans. For the shop and business owners this occured at the very worst time—during their busiest tourist season. Due to the sewage laden beaches, business was off over 50% in most restaurants, hotels and shops. One restaurant owner reported an evenings business of 15 dollars; one shop owner in Imperial Beach had a total days sale of only $7.25; and one motel owner lost $40,000 during the month quarantine. Normally business would be much higher for these Imperial Beach residents.

This incident clearly points out the problems encountered by the citizens of San Diego. Not only were businesses affected, but more importantly, the health and safety of these citizens was seriously threatened.

An equally alarming problem exists about one hundred miles away, along the New River which flows through Imperial County and empties into the Salton Sea, a major recreation area. In the past this river has been named the most polluted in California and unfortunately this year was again named the State's most polluted with raw sewage and toxic chemicals. A recent study conducted by the California Water Quality Control Board showed that 25 percent of the New River flow at the Calexico/Mexicali border contains harmful wastes from Mexicali. This study details dozens of pipes and open discharges carrying raw human sewage, toxic industrial chemicals, pesticides, oil and grease, slaughterhouse carcasses and wastes from hog and dairy farms.

Along with the Tia Juana River, the New River presents a serious health problem for the people in the Imperial Valley and again it is a problem that has existed for decades without a solution.

We have negotiated with the Mexicans for years and encouraged them to clean up both the Tia Juana and New Rivers. While they have expressed interest and agreements have been signed, the situation is unlikely to improve unless we take some action. In recent months, through the hard work of Ambassador Gavin, the Mexican government is beginning to look at ways to provide proper treatment facilities in Mexico. Since this problem originates in Mexico it would be preferrable if the Mexicans brought this situation under control. However, we can no longer wait on this issue and we can no longer ignore the health and safety of our citizens because the source of the problem exists elsewhere. That is why I strongly support the City's request for authorization of funds to cover preliminary engineering expenses and site aquisition for a plant to treat sewage from the Tia Juana River. In addition, I urge the Subcommittee to authorize funds for the same purpose for the New River.

Again, I appreciate the opportunity to testify before you and bring this serious situation to your attention. I would be glad to answer any questions you may have. Thank you.

TESTIMONY OF HON. PETE WILSON, A U.S. SENATOR FROM THE STATE OF CALIFORNIA; HON. DUNCAN HUNTER, A REPESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA; ACCOMPAINED BY RICHARD KING, DIRECTOR, SAN DIEGO WATER UTILITIES DEPARTMENT, AND WILLIAM HARRINGTON, WASHINGTON REPRESENTATIVE, SAN DIEGO

Senator WILSON. Thank you, Mr. Chairman.

I wish to thank you not only for your kindness and courtesy, we are very grateful, Congressman Hunter and I and Mr. King and Mr. Harrington who you have kindly introduced. We are grateful both personally and on behalf of the constituents whom we represent in San Diego County who are very much affected by the problem we will describe this morning.

I thank you for your leadership and your very generous remarks with respect to the efforts that we have made in San Diego County to achieve clean water. That is precisely the focus both of the committee and of the public officials in San Diego County who now find the success of those efforts threatened by genuinely external circumstances, circumstances that are largely beyond our control.

I refer, of course, to the fact that we are threatened with a problem that I think most would agree and certainly the EPA officials have identified as the most serious water pollution problem in Federal region 9, a four-State area that has not just attracted national attention but has received the urgent attention of your committee for which we are very, very grateful.

We are seeking relief from a major uncontrolled source of pollution, that is literally a daily hazard to the health and environment of San Diego County citizens. Directly south of the city of San Diego lies the city of Tijuana and the Republic of Mexico, just over the border, a city which since the 1930's has grown from a small border village into a commercial-residential city of approximately 1 million population.

Tijuana has neither a reliable sewage collection system nor a sewage treatment facility, moreover, only about 50 percent of Tijuana's population is or can be currently connected to its sewage system.

In spite of this lack of connection, Tijuana's system currently collects 20 million gallons of sewage per day. The estimate is that this current volume could triple by the end of the century. To make matters worse, it is not unusual for Tijuana's sewage system to fail completely. San Diego has been receiving and disposing of Tijuana's sewage daily for the past 3 years because of such system failures.

The question is appropriately asked whether we concern ourselves with the condition of a city located—with a sewage system with its problems in a city located in a foreign country. The answer obviously is because San Diego is at a lower geographic elevation than Tijuana. In addition, for a good part of the year ocean currents flow northward along the coastline to California shores, more accurately and specifically, from Tijuana to San Diego.

The facts are inescapable that millions of gallons of raw sewage are daily pouring uncontrolled across the border from Mexico to pollute and contaminate nearby U.S. valleys, streams and beaches.

For half a century Federal, State, and local agencies have struggled with this problem and yet despite long-term efforts in both countries the problem has only increased in its severity.

Candidly, Mr. Chairman, the citizens of San Diego County and its nearby communities that are forced to live daily with pollution that flows from Mexico have grown understandably impatient in the search for a solution.

San Diego is convinced if the problem is to be solved the initiative must come from the American side of the border. We also believe the flow of pollution that emanates from Mexico is a responsibility internationally of the U.S. Government. For these reasons we appear before you today to state our case, and ask your advice and assistance.

Since the 1930's San Diego and its environs have suffered pollution from Tijuana sewage. During the early years the Mexicans built "band-aid" facilities which were eventually overwhelmed by increasing demands. In 1965 the latest "band-aid" effort took the form of a service agreement between the United States and Mexico. The two Nations agreed that the city of San Diego would accept domestic sewage from Tijuana into the city's metropolitan sewer system, metro, under emergency conditions.

For the past 3 years, San Diego has treated Mexican sewage on a daily basis. In effect, there has been and continues to be a permanent emergency in the Tijuana sewage system.

As a consequence, San Diego is collecting, treating and disposing of 80 percent of Tijuana's daily sewage load. Further, under this emergency condition, San Diego, because of contractual obligations and because of our own self-interest, receives approximately 15 million gallons of Mexican daily sewage for treatment and disposal. The balance amounting to some 5 million gallons per day Tijuana pumps into the ocean, a short distance below the border.

This joint effort constitutes Tijuana's present emergency sewage disposal system. Now the problem is aggravated considerably when as so often occurs, Tijuana cannot pump its daily 5 million gallons excess into the surf because of the total failure of its system or because of brakes in its collector system. In that event, the 5 million gallons per day simply follows the elevation contours and flows into the Tijuana River Valley on the United States side of the border and contaminates and pollutes lands, waterways and beaches.

Mexico's response to this problem has been to commence construction of larger facilities which will carry all of Tijuana's sewage, that is the present volume of 20 million gallons per day, to the present ocean discharge point. But work on these facilities was halted last year due to the peso devaluation and to the pending change of national administration. It is entirely uncertain when that work will resume.

Mexico speaks of the future system which will carry sewage from Tijuana to a treatment facility to be built approximately 18 miles south of Tijuana. Unfortunately Mexico cannot say when this facility will be operational.

In sum, Mr. Chairman, we are not optimistic about a timely Mexican solution to the pollution problem. Mr. Chairman, the last

band-aid has been applied and the patient is bleeding to death or perhaps, to mix metaphors, we are literally being inundated.

San Diego has concluded that the tourniquet must be a construction of a U.S. facility on the Mexican side accepting Mexican sewage, and discharging that treated effluent into the Pacific Ocean through a deepwater outfall. If the international facility we describe is the permanent solution to the problem, then the next question to be answered concerns the most expeditious method of getting it built because quite clearly San Diego is in the midst of a water pollution crisis.

Normally the construction of a treatment facility such as I have described would require 8 to 10 years. Obviously this is not a quick response, it is not a quick enough response to a health and environmental crisis. The time line must be compressed.

To do so we would suggest the establishment of a set of procedures unique to this international project, essentially these procedures would modify on a one-time-only basis existing law to the extent that the various Federal approvals required for the project's construction could be fast tracked. This concept has been discussed with the EPA and the Agency has indicated a willingness to cooperate, provided Congress approves.

The cost of constructing this facility will be substantial. Exactly how much it will cost will depend on final design decisions. We don't have that data. Congressman Lowery has a study that is in progress; it was begun this summer. It is to be completed in October, but in the interest of moving ahead we would propose to the committee today an authorization of an appropriation sufficient to cover acquisition of the facility site and the preliminary engineering expenses.

At the conclusion of that study in October, we will be able to provide a number. It will be a relatively modest amount. As the details of the project unfold, San Diego would ask the privilege of reappearing before your committee to report progress and to request the precise amount required for final design and construction funding.

Finally, we would like to comment on actions necessary to develop and maintain a pollution-free transporter area. The United States-Mexico agreement on cooperation for protection and improvement of the environment of the border area, recently signed by Presidents Reagan and de la Madrid, is a necessary first step to a long-term cooperation between the nations.

We would hope that in the drafting of a sanitation index to this agreement, consideration would be given by the United States to a binational plan of mutually beneficial and contingent actions which will ultimately result in Mexico having full responsibility for all its sewage.

Mr. Chairman, unfortunately, that annex to the agreement does not exist and for the reasons that I have already indicated, we cannot be complacent that it will be done on a timely fashion to avert the crisis that already exists and is threatened daily with a very considerable aggravation.

We thank you, Mr. Chairman, for your leadership. We thank you for your courtesy in hearing our petition.

At this point we would be happy to answer questions from you or from the members of the committee.

Mr. ROE. Thank you, Senator.

Does our colleague, Mr. Hunter, have any further comments?

Mr. HUNTER. I have just a few comments, Mr. Chairman.

I appreciate, also, you giving us the opportunity to testify before you. I would like to make a few comments beyond those made by the Senator.

I think he stated the situation well. I think that one thing we have to realize is that the crux of the problem is that the Tijuana River Valley, which runs from the base of Rodriguez Dam which is on the Mexican side of the border, down across the border and terminates at the beach town of Imperial Beach in San Diego, is a drainage, if you will, that is on both sides of the border. The problem is going to have to be treated on both sides of the border.

This last summer we had pollution which required a quarantine of the beaches farther than had ever occurred in the past. The city of Imperial Beach was devastated; it is a small town of 22,000 people that lies only several miles north of the international boundary.

The problem has been a result of not only inadequate facilities but also of chronic breaks in the lines, sewage lines that do exist on the Mexican side whenever there is heavy rains. The lines tend to break and sewage flows northward, if you will, and gets into the Tijuana River and ultimately into the ocean area.

Also there is a direct outfall in which the Mexicans discharge raw sewage right into the surf, only a couple miles south of the international border, and that—and there is a plant down there in the Playas area, about 2.6 miles south of the border, which has breakdowns on a regular basis. That results in raw sewage being discharged into the surf and ultimately that sewage contaminates the water offshore San Diego.

Again, the sewage carries bacillary, dysentery, typhoid fever, and infectious hepatitis. It is an extreme health problem. It is my opinion and the opinion of the health officer in the San Diego area right now, that it contributes to infant mortality rates on the Mexican side, and could affect the American side, too.

I need to expand the discussion somewhat because my district covers the entire border there, and in the Imperial Valley we have a similar situation. It is not of the same proportions. It doesn't receive the same amount of sewage but it does—it is a serious situation in that we have the New River flowing north from Mexico, that crosses the border and Calexico and Mexicali and it brings with it waste from plants in which animals are slaughtered, it brings with it toxic wastes from fungicide plants on the Mexican side, and if I could, I have shown you a couple pictures of some of the operations that direct raw chemicals into New River which in turn brings these north.

We have the worst toxic waste problem according to the EPA in California manifested in this flow in the New River. It is flowing into the Salton Sea about 30 miles north of the international border and it is killing right now the Salton Sea. It is a major area of recreation in California and sport fishing and it lies at the north end of the Imperial Valley.

The sea will be dead within a number of years if that flow is not stopped.

Let me speak briefly as to the actions of our representatives in Mexico City. Ambassador Gavin is very concerned about this problem. He has been one Ambassador who has been extremely interested in getting it solved. It was at his insistence that the Presidents came together and signed an agreement, an executive agreement regarding a border environmental district to which as the Senator said, annexing agreements could be placed that would involve the specific problems.

In other words, we could make various annexing treaties to take care of these problems. The problem is Mexico does not at this time have the money to solve the problem. Right now our Ambassador is trying to assist them in getting perhaps some international money, some type of loan so they can assist us in solving the problem, but again, I think it is absolutely imperative that we take the leadership in this operation if we are going to make it work.

So our State Department and our Ambassador are working to solve the problem.

One last thing I would like to say—and I know perhaps that Dick King, who is the pioneer really in water reclamation with water hyacinths who has an operation in San Diego would like to testify. We would like to have a facility that could evolve into a water reclamation facility. We have been reminded by governmental leaders in other States that it is very possible technologically, something that is done in other areas to reclaim the water.

As you know we use a great deal of Colorado River water, it is very precious and in the long run we will need to reclaim this water. We will need cooperation of the Mexicans but at this time we need to go forward. If we don't start now we are going to see the population of Tijuana being past the million mark before 1988 and we are going to see the population of Mexicali pass the 1 million mark also and if we don't make the land acquisitions now for these facilities and perhaps doing engineering work, we are going to find that we are behind the curve and we will see a tremendous impact on the American population along the border, both in the Imperial Valley and in the San Diego area, for many years to come.

This will be an impact with great economic as well as health consequences.

Thank you, Mr. Chairman and members of the committee for allowing us to testify today.

Mr. ROE. Thank you very much, Congressman Hunter.

Do Mr. King or Mr. Harrington have anything to add?

Mr. HARRINGTON. Not at this time.

Mr. KING. No, thank you.

Mr. ROE. You are available to answer questions?

Senator WILSON. Mr. Chairman, I would just say that if you have any questions that might relate to the intricacies of aquaculture we do have at hand a genuine expert and pioneer in the field, Mr. King, who enjoys a deserved national reputation.

Mr. ROE. We appreciate that. No question about it.

Now, let me ask you this: As I understand the situation, how long has this situation been going on? I see that we have been

doing the "emergency" pumping into our system for the last 3 years. Has it been going on for a long time before that?

Mr. HUNTER. The problem has existed to some degree, yes, for decades, Mr. Chairman, simply because the Tijuana sewage system has never been adequate, in that whenever there is heavy rain in the area the lines that parallel the international border, just in the interior of Mexico, that run the sewage out from Tijuana to the ocean tend to break. These lines break and the sewage of course goes down the hills and flows into the Tijuana River Valley.

Also chronically the pumps that move the sewage south to the Playas pumping plant break down and when that occurs the sewage runs right into the ocean before it gets to the plant or runs across the international border into the Tijuana River basin and there are a number of raw sewage outlets that run into the Tijua na River basin which is normally dry on the Mexican side, so you have sewage bubbling out of the outlets and running into the river basin and basically seeping beneath the sand.

When Rodriguez Dam gets a head of water behind it and water has to be released—which is at the head of the river valley—or you have excessive rainfall and therefore the release is necessary, the water is released, it comes down through the Tijuana River Valley on the Mexican side and flushes this raw sewage which has bubbled out of the various outlets in Tijuana down through the Tijuana River Valley and into the United States and into the Imperial Beach area and ultimately into the ocean.

Again, at that point the quarantine restrictions are invoked along the beach. So it has been going on for many, many years but it is intensifying because the population of Tijuana is literally exploding.

Mr. ROE. I am trying to establish a set of facts. It has been going on a long time, we have taken interim action vis-a-vis the situation of the 3 years which turned into a permanent situation as the Senator stated in his testimony.

So, therefore, there isn't a disjuncture, any agreement per se that is a standing agreement between us and the Mexicans other than that which you spoke to, the accord and we have to get to that. There is nothing formally nailed down on a specific plan.

Senator WILSON. That is correct, Mr. Chairman. The agreement that is in effect which commits us to handling their emergency needs is one that is due to expire in 1985. Local officials in San Diego will not sign a similar agreement as they did in 1965 after the Federal Government had effectively negotiated that agreement.

The problem is that even if they don't sign it, the laws of nature being what they are, they are afflicted with a problem.

Mr. ROE. Was the agreement signed, is it between government to government or is it an operational agreement between San Diego and the city of Tijuana, do you know offhand?

Senator WILSON. I am going to allow Mr. King, the director of water utilities, to respond.

Mr. ROE. I am leading to a point.

Mr. KING. Mr. Chairman, members of the committee, the agreement is between the city of San Diego and the U.S. Government. There is also an international minute between the United States——

Mr. ROE. You are saying the agreement is between the city of San Diego and the U.S. Government who negotiated another agreement with Mexico to do certain things?

Mr. KING. Yes, sir.

Mr. ROE. It doesn't—does it have the effect of a treaty or what?

Mr. KING. It is called a minute. I don't know what that otherwise would refer to.

Mr. ROE. I am just wondering if it is a comparable situation that we have with the Canadians on the St. Lawrence Seaway and so on. We will look into that.

Senator WILSON. I think it is.

Mr. HUNTER. Mr. Chairman, there is a base treaty, a minute order, that exists, but there is a base treaty that as arrived at back in the 1940's which was used initially as a foundation for this arrangement. I have seen that in some documentation I have read.

So it needs a little research, I think. When we put a provision in the recent appropriations bill that would reimburse San Diego for part of the deficit that they have, it costs them about $1.5 million to get this sewage now, and they will only get about $150,000 from Mexico, and when we put this provision in, I noticed that Mr. Udall was asking also for a deficit funding because they are treating some of the Arizona sewage; Nogales is treating Mexican sewage also.

So it arises from an international treaty, and we need to look into that. I have seen it one time, a treaty made, that was the basis for this.

Mr. ROE. Boundaries Water Treaty.

Mr. HARRINGTON. Just a point of clarification on the agreement. The genesis of this 1965 agreement lies in a 1944 treaty between the United States and Mexico. The 1965 agreement was negotiated by the International Boundary and Water Commission. The American section and the Mexican sections were involved. Subsequently, the city of San Diego, at the behest of that body, agreed to sign the agreement. That is because of our being signatory.

Mr. ROE. It seems to me on the basis of what the Senator and our colleague testified to and yourselves is that this has gone on for 20 years, and if we don't nail something down, it will go on for another 20 years.

Senator WILSON. The only amendment I would offer to your statement is that it would go on but grow much worse. As Congressman Hunter has pointed out, there is a population explosion within the city of Tijuana. It has become long since the busiest international crossing in the world.

It is also the point to which a considerable amount of migration has come from the interior of Mexico.

Mr. ROE. Well, I am an activist and I don't believe we should take all our time going into agreements if we don't do something. We have to do something. It seems to me the only way we can—if the agreement is locked in with San Diego. San Diego is locked in under the funding allocation that comes to California, and they have an added starter is what it amounts to, the effluent coming from Tijuana. Isn't that what we are talking about? Do you understand what I am saying?

In other words, there is $2.4 billion allocated for funding under the Clean Water Act. Through the formula devised therein, a certain amount goes to California. What I am trying to get at is in order to get funding to be able to do something, you don't want to include that under California's allocation because the rest of the State will "blow their stack," so to speak—pardon the euphemism.

Now we have to come up with a solution to get this done; otherwise the way the levels of funding are going, the $2.4 billion is like they have extended the sewer program to get to the optimum goal by at least 15 years. The needs are far beyond that.

Mr. HUNTER. Yes.

Mr. ROE. Therefore, as chairman of this subcommittee, I am thinking somewhere along the line, it seems to me, that as the technology is improving in this field and the fact that the problems are being isolated now—identified is a better word—and are international in nature, that it may be that the committee will have to consider special separate authorizations in this bill to provide the mechanisms that you need.

At the present time there isn't any mechanism to provide funding for Tijuana and there isn't any to provide funding to you to solve the problem with Tijuana.

So what I am coming back and saying is that someplace along the line, this will be a major departure; people rebuffed that. They say: "Look, we will put the money in a pot, and we have a formula by population" and whatever the State gets, and that won't solve the problem. Is that the point you are trying to make?

Mr. HUNTER. That is right. We have a problem that is unique because of the international nature of the problem.

Mr. ROE. Therefore, we are coming back, and are we saying this as Members of the Senate and the House, should the committee be considering where the special, unique problems evolve that they should be treated unto their own remedy, and should not denigrate the funding allocations to the States involved?

Senator WILSON. That is right.

Mr. HUNTER. Yes, Mr. Chairman.

Mr. HARRINGTON. As a matter of fact, there is a point of law here. We have been told by EPA that EPA funds cannot be used for foreign sewage.

Mr. ROE. It is still early in the morning, and we still have a sense of humor and somebody ought to say to EPA: "That is fine; maybe they should put up a packaging plant and solve it." Because unless we do something, as the Senator says, we will have real problems.

The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

I believe you do perceive the essence of the problem. We have a city south of the border, Tijuana, perhaps the fastest growing city in all Mexico. Where it was a sleepy border town a few years ago, it is now over 1 million people.

Mr. ROE. Will the gentleman yield? How many Americans visit Tijuana? Of the 1 million, how many are Americans? I just wanted to make a relative point.

Senator WILSON. We estimate 1 million Mexican population, and that is substantially enhanced each day by American tourists.

20-955 O—84——31

Mr. PACKARD. And at the same time we have San Diego, which is one of the rapidly growing cities of the West, and it now is pushing 1 million. It is now the seventh largest city in the country, and so you have two major cities side by side with this river flowing between from one side of the border to the other.

We have one that meets the water-quality standards, or at least has the mechanism to do so, and the other which has no quality standards whatever, and the one is impacted by the other. It is a major, major problem.

I would like to ask the witnesses a couple questions. To what extent, to your knowledge, will this proposed project assist San Diego in its future water-quality problems?

Senator WILSON. It will assist San Diego and to the extent that the benefit can be apportioned, I think San Diego is quite prepared to accept its share of the cost. I was asking Mr. King—and I will let him elaborate—but the facility that is envisioned, if it is a standard treatment plant to give primary treatment to effluent to be discharged into the ocean, would have a capacity of 150 million gallons. Their current capacity for this Mexican sewage is 50, and they are at capacity.

So that envisions a tripling of the capacity that they are now required to accept from Mexico. It envisions substantial growth within the South Bay area of the city of San Diego and association of development of Otana Mesa.

Mr. PACKARD. And the division of responsibility between Mexico and us has been established in this proposed project?

Senator WILSON. Yes, it has.

Mr. PACKARD. If Tijuana was not tied in with their existing system, would your system adequately take care of the present population of the city of San Diego?

Senator WILSON. If we were not handling any Mexican sewage?

Mr. PACKARD. Right.

Senator WILSON. It would handle the present, yes.

Mr. KING. That is correct. The capacity of the city of San Diego's sewage plant is more than adequate to take care of present needs and projects.

Mr. PACKARD. So, this project, as you see it, is primarily being proposed to handle the foreign sewage?

Mr. KING. Yes, sir; the motivation right now, the first point, is that Tijuana sewage, and secondarily is whatever extra capacity the city of San Diego would need in its South Bay area.

Mr. PACKARD. I would like you to review for us why the U.S. Government should pay the construction costs for sewage facilities for Mexico.

Senator WILSON. I think the answer to that is that it is properly the responsibility of the Mexican Government. The reality is that they have not, perhaps cannot, discharge that responsibility. In any case, it is pretty clear from the lack of progress that has been made and the total cessation of construction on this facility that supposedly would accommodate the needs of Tijuana that San Diego cannot reasonably anticipate that that will be completed in any sort of timely fashion. Very much to the contrary.

In terms of why the U.S. Government, rather than the city of San Diego—I think the answer to that is because this is indeed an

international project, problem, impacts are local. The source is from a Nation outside the U.S. borders.

As a matter of law, I think the chairman has developed very well in his line of questioning that the agreement to accept this Mexican sewage is pursuant to a minute order that goes back to the 1944 treaty that was described by Mr. Harrington.

Mr. HUNTER. I might add, though, Congressman Packard, that there is an opportunity, I think, in the future to get Mexican cooperation if we take the lead, and we are working on that; we are working on doing everything we can and our ambassador, John Gavin, is working on getting Mexican participation financially in this project.

But let me give a brief example of the last crisis situation. Mexican pipes broke on their side of the border that could have been fixed with about $150,000 worth of work. Now we still have raw sewage coming in, we are still taking their sewage into our disposal facilities, but these were emergency breaks that resulted in raw stuff just flowing across the border and into the water.

Because nothing was done in this crisis and they were not patched up, the entire southern end of San Diego beaches were quarantined, and small towns like Imperial Beach literally lost the greater part of their entire summer's revenues because basically Imperial Beach is a tourist town, that is their industry.

We had hotel operators who lost everything. The impact of those breaks and the resultant sewage flow across the border amounted to many millions of dollars to Americans and to the American communities. So it—it is just not a matter of inconvenience to the city of San Diego and the South Bay cities, it is a matter of survival for part of our community.

Senator WILSON. If I might interject, Mr. Chairman, in response to Congressman Packard's question, I subscribe fully to the comments made by my colleague, Congressman Hunter. I do want to underscore, however, that even though the adverse economic impact that he has described is completely accurate, the primary concern we have here today has to do with the quality of the water and the health hazards portended by this pollution.

You asked, why should the Federal Government be charged with making a contribution to the solution of the problem? I think the answer, in addition to the treaty aspect that we have described, is that what we are really talking about is an area of the United States which the chairman generously described as having demonstrated some leadership in cleaning up its water, is suffering intolerably from conditions that the Clean Water Act was designed to remedy.

If Tijuana were a city in California, it would have long since received, with full blessing of this committee, a clean water grant that would have eliminated the problem we are concerned with today, but because it is on the other side of the artificial line out there and because the law of nature ignores that line, we are talking about a situation that is intolerable that must be addressed and that the chairman has accurately defined as requiring a special treatment. It is a unique situation.

Mr. PACKARD. Why don't we provide the money and require Mexico to build the facilities on their side of the border and dump in their waters?

Senator WILSON. We could do that, assuming agreement on their part. I would have to say that the history of sewage treatment on the two different sides of the border would make me feel far more confident that the problem would be better treated from a technological point of view on our side of the border.

Mr. PACKARD. I would certainly agree with that.

Would it be possible just to put an outfall into the ocean and get rid of the pollution far out into the ocean?

Senator WILSON. That is a possibility. It is not a good one because an outfall, I think Mr. King can tell you in greater detail and with much greater authority, is not simply a pipe that is dumping the sewage. At least it shouldn't be that.

It requires special attention. In fact, having set many up, I am going to defer to him and have him tell you in some detail why.

Mr. KING. Thank you, Senator.

To put an outfall in the ocean is a very complicated process and requires considerable amount of time, and all we would be doing, in essence, would be putting raw sewage into the ocean which wouldn't be a satisfactory arrangement at all.

Mr. HUNTER. Also, there is I think somewhere down the line the fact we should construct a plant that could evolve into a water reclamation, and we are paying in excess of $100 per acre-foot for water now in our area. If we could evolve that into a reclamation plant ultimately, it could accrue to our benefit.

As you know, Ron, we have a real problem coming up in the next several decades regarding a shortage of water in southern California.

Mr. PACKARD. One last question, and then I would make a couple comments.

Supposing Mexico really is not cooperative and doesn't give permits and even though we furnish all the money, where do we go from there?

Senator WILSON. Congressman, first I would hope that that is not the case. But let's assume that it is. It is in our best interest that the facilities be built. Unless we do build the facilities that are being requested, we are going to be afflicted in San Diego County with an intolerable health problem.

In the worst case, San Diego would have to undertake that or some alternative course of action, and I don't think it is fair to impose on a locality a burden not of their making and a burden that has been accepted in this instance under the auspices of the Federal Government.

Mr. PACKARD. Mr. Chairman, I have lived and served government in San Diego County and serve part of the city of San Diego right now with my congressional district, and I have watched this problem grow out of proportion over the last 25 years. It is a unique problem that I think needs to be addressed separately and apart from the normal funding and approval processes as you have suggested.

I think it does require special language. I am totally supportive of the project. I have worked with the city of San Diego on the As-

sociation of Governments in San Diego County trying to find solutions, and this has evolved as perhaps the best solution to a very, very difficult problem. I am hoping the committee will take leadership in trying to solve this problem that is not only a specific one to San Diego, but it is a border problem that may exist in other parts of our country.

Thank you.

Mr. ROE. One more question before we proceed to other members. Does anybody have an idea of what the costs are involved for this?

Senator WILSON. Before Mr. King begins, I am going to ask that you and members of the committee to excuse me. I am reluctant to leave, but I am scheduled to preside over the Senate at 10 o'clock.

Mr. ROE. We appreciate your input. Thank you.

Senator WILSON. Thank you very much.

Mr. ROE. Does anybody have an idea of what the estimated cost involved is?

Mr. KING. The consultant has not completed his study, Mr. Chairman, a particular solution has not been determined for its location. But if we were to take a figure that was developed in the last 5 years for a similar program that did involve treatment with an outfall and put the price of inflation on it, it would run somewhere in the neighborhood of three-quarters of a billion dollars, $750 million, if we take that figure and extrapolate it.

Mr. ROE. Are there any other questions for the witnesses?

Mr. EDGAR. Mr. Chairman.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. I was going to ask the cost questions, and I understand you don't have specific figures on that. How much of that $750 million would you be asking the Federal Government to contribute?

Mr. KING. One hundred percent.

Mr. EDGAR. Why wouldn't the State of California make some contribution to that cost, 10 percent, 20 percent, so that there would be some sharing of Federal-State resources?

Mr. KING. I would hope that something like that would be worked out. At this point in time, that has not been settled. There has been some indication, a willingness by California, but I am simply not able to speak on their behalf.

Mr. EDGAR. The reason I ask the question, it is very difficult to conceive in the future 100 percent funding for any project, worthy or unworthy. We have had a history of some projects that have been questionable, and they have competed with projects that have been meritorious and many times we have had to squeeze those projects.

The chairman has developed a good omnibus water bill that is looking at projects in other water areas, port facilities and things, and one of the premises we are making in that legislation which is now moving through the House is that there will be State and local participation in whatever development we have. I understand the international implications of this which make it unique.

I also think some benefit will accrue to the State of California because of this large Federal involvement.

Mr. PACKARD. Will the gentleman yield for a moment?

Mr. EDGAR. Yes.

Mr. PACKARD. In my questioning, I asked if the city of San Diego has adequate facilities exclusive of their taking Mexican sewage to handle their own problems. The testimony given was that they can solve their problem with their existing facilities and that the problem essentially then is a national and international problem. I think that is the reason they see it as a Federal problem.

Mr. EDGAR. I guess I would argue it is a Federal problem, but it has some State implications, and while it may not accrue directly to the City because their water treatment system may be adequate if they didn't have the Mexican sewage, I think there is some——

Mr. HUNTER. Mr. Edgar, I would like to inject one other dimension and that is that we are working, presently our State Department is working again, and our ambassador, to require Mexican participation. I think it is appropriate that they participate to some degree.

In that regard, we have provided for the Mexicans a desalinization plant on the lower Colorado River which will cost the U.S. taxpayers upward of $500 million over the next several years, and there is a possibility that desalinization plant could be reduced to some degree and some of those funds perhaps could be used for reclamation both in the New River problem—incidentally, the New River problem, the preliminary estimates I have, they are very general, is about $50 million. That is in the Calexico-Mexicali area.

But there is a possibility to use those funds. That fact points out the inequity with which the problem has been handled. We basically are paying $500 million to ship clean, clear water to Mexico so it can grow crops in the Mexicali Valley, and they, in return, are flowing raw sewage and some of this junk and DDT that is coming across the border to reward us for that generosity.

So I think that some participation should be forthcoming, but I think the important point is that we need to take the leadership; and to protect the health of U.S. citizens, we need to move now because it takes quite a while to build the facilities.

Mr. EDGAR. That is my next question.

Do you know how many people live in Mexico today?

Mr. HUNTER. No, I don't.

Mr. EDGAR. I think the estimate is somewhere in the area of 65 million people. The interesting statistics that I think all of us need to be aware of is that in 17 years that number will be 150 million people; the average age in Mexico is 18, and that with the projected birth rate in Mexico, it will be increased to the point where in 40 years from today there will be 280 million people living over our southern border if there is no change in population trends.

So the problem you state in reference to cities that grow by a million, we are talking of that kind of thing happening exponentially. The city of Mexico City will be the largest city in the world by the year 2000.

The pressure on that city in terms of water supply, sewage treatment, all of the problems that you are stating Mexico is not now presently caring for will be enormously increased. You know, we are facing a problem with how to help the Mexicans deal with this population influx in terms of sewage, water supply, agriculture, food supply, and in terms of impact on our border.

My guess is that some of the concerns that are being voiced along the border, albeit immigration, or the problems faced with water and sewage treatment are going to be catastrophic if we don't have some planned relationships between the Mexican Government and the United States.

Mr. HUNTER. On that point, I was privileged to go down with the negotiating team that worked out the agreement signed by the Presidents in August, and we have put EPA into the loop. Before the International Boundary and Water Commission was our commission that dealt with the Mexican Government and their environmental commission; we now have EPA as our national coordinator working with them.

I think with their aggressiveness and their expertise, we are going to be able to assist them more in that regard than we did before when we simply had the International Boundary and Water Commission only on problems on the border. I think this administration is moving toward trying to provide leadership in that regard.

Mr. EDGAR. I would make one final comment, the suggestion this be dumped out in the ocean is I think not a good suggestion because I think you will simply kill large portions of the ocean, and there are fishing interests and other cultural interests in the oceans that are important to protect.

I am not certain that is the answer.

Mr. HUNTER. I think when you are paying over $100 an acre-foot for water, you have to look at least downstream at reclaiming the water at least for industrial and agricultural use.

Mr. EDGAR. Thank you, Mr. Chairman.

Mr. ROE. The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

San Diego has been in the forefront in developing new approaches to addressing your city's sewage treatment needs. The tremendous amount of credit goes to the Senator as mayor and to his highly respected water utilities director, Mr. King. Mr. King, the last time we considered clean water amendments in 1981, we had a grant eligibility for the San Diego aquaculture project. Will you give us a progress report on how that project is progressing and what the current funding situation is?

Mr. KING. Thank you, sir.

The city of San Diego was fortunate to receive the amendments to the Clean Water Act designating its aquaculture sewage treatment process total resource recovery system as an innovative and alternative process.

As a result of that action, the city has applied for the grant funding to proceed with the facility to do what that technology wants done, what is a total recycle of sewage to potable water, generation of electricity and so on. We have filed our reports with the State water resource control board. It is my understanding within 2 or 3 weeks we will be getting approval to proceed with the rest of the construction on that project.

As far as the first portion on the aquaculture, we have under construction a 1-million-gallon-a-day facility, and it ought to be starting operations between November and December. So if any of you are out in the San Diego area, I extend a very cordial invita-

tion to you to see our recycle system in action, which is pretty much the result of efforts taken by the Congress.

Mr. HUNTER. Could you, Dick, tell us what this is? I think it is extremely interesting. Tell them how you set this up with the hyacinths.

Mr. KING. In essence, what we have done has been to take a page from the way nature treats its wastes and that is, we have put a swamp in a tank. We have six plastic-lined tanks, and we have started out by loading the tanks, scooping up the muck and animals from the San Diego River, so we could seed the tanks with the animals that are in the natural environment.

We have raw sewage going directly into the tank, it is not pretreated by primary or secondary treatment. It is raw.

We have mosquito-eating fish, we have the water high assignments, we got the idea from the NASA because they have an unusual ability to remove toxic substances, heavy metals, herbicides, and pesticides. In essence, it is simple, nothing mechanical. It has been running for two solid years. There has never been a failure, no odor, no mosquitoes, and produces a water spore to water product from secondary treatment, using the standards of suspended solids and DBD removal.

It is working very well.

Mr. STANGELAND. Mr. King, how is this impacted by EPA's categorical requirement for pretreatment if you are talking about raw sewage? They are talking about primary treatment.

Mr. KING. When I appeared before you, I believe it was about 5 years ago, it was because EPA was not granting innovative funding unless the treatment was relative to secondary treatment, innovative to secondary treatment.

I think I was asked why this was—wasn't there something in the law that made this aquaculture grant fundable anyway and I testifed that it was. But it was the way the law was being handled by EPA.

With your putting the amendment in there declaring this to be an innovative and alternative process made it possible for us to use raw sewage to go straight to aquaculture and we don't secondary treat at all.

Mr. STANGELAND. Much discussion has taken place in the past years about whether the Act's pretreatment authorities can be improved. Can you share your thoughts of how the pretreatment program could be improved?

Mr. KING. I think the pretreatment act—speaking generally—could be improved by putting more control at the local level and letting standards be set to fit the various industries that are peculiar to a local city, something along that line.

Mr. STANGELAND. Thank you very much.

I just want to, with 1 more minute, state that I tend to agree with the gentleman from Pennsylvania on the cost sharing of the project and I will state why.

I am sure that none of us here would think that San Diego or California ought to be liable or responsible for Mexico's pollution. On the other hand, I am not sure that the Federal Government has total responsibility either but, because of the economics and facts that are there, somebody has to do it and we have to protect our-

selves. But there is a tremendous benefit to California to get this sewage treated and cleaned up, so I think California has a share in this.

I would hope the delegation and our Government in whatever fashion would approach Mexico and see what portion Mexico might want to share in lieu of the pumping plant facilities they are talking about.

I also see that if we are going to build this plant we ought to build it on our soil so that we can control it and run it and make sure it is operable.

Thank you very much.

Mr. ROE. Are there any further questions for the witnesses?

The gentleman from Minnesota, Mr. Weber.

Mr. WEBER. Thank you, Mr. Chairman.

I just want to say I am fascinated by the process you described, Mr. King, the aquaculture treatment. I do not want to tie the committee up or the panel longer, but you described the impact of that treatment. Could you tell us a little about the economics of it?

How does it work out, how does it compare in terms of up-front costs, long-term maintenance costs and that sort of thing, as opposed to conventional treatments?

Mr. KING. Everything we have done on that matter has been estimated, no plant of a large operational size has been built so there is no hard data to make a comparison, but we have done a considerable amount of estimating over the years and the costs seem to run something about like this: It runs about 10 percent to build an aquaculture facility in contrast to secondary treatment. These are general figures. As far as operations, it is substantially less costly.

First of all, there is no hardware in it, no gears. When you go there, all you see are plants growing. There is no wheels, no catwalks, no concrete, no transformers, nothing in the way that you would see in a normal sewage treatment facility.

What we have done—the cost figure I will give you now, however, may be peculiar only to San Diego because the city of San Diego has to import about 90 to 95 percent of its water. We only have enough rainfall in San Diego for about 50,000 people. So drinking water is a major problem.

Now, the cost comparison I give you now is relative to San Diego and if you were to add up what a homeowner would pay for their water and sewer bill, the city of San Diego could provide that service to its citizens for about 60 percent of present costs if we had a recycle system in contrast to the conventional treatment of where we live in a society where we use it once and throw it away type of thing.

So that is about the best data we have now. The high assignments do digest it. In our original estimating, we felt they would produce 30 percent of the electrical needs; however, we find now it will produce almost 100 percent of our electrical needs.

I say further, the aquaculture process gets rid of ammonia, which is a substantial savings when we go to total recycle.

Mr. STANGELAND. Would the gentleman yield?

Mr. WEBER. I yield to my colleague from Minnesota.

Mr. STANGELAND. How about from raw sewage to potable water, how long a timeframe are we talking about?

Mr. KING. From the start we were told that this would take about 10 days or work out to be a 1 acre, or about 10 acres per million gallons. What we are doing is running 2 to 3 days per million gallons in retention time in the aquaculture being 3 to 3½ days. After the aquaculture we run it through a final mechanical process which is called reverse osmosis. We use carbon absorption and chlorination. That removes the final salt and viruses.

Years ago we, for the University of California—personally, we injected polio virus on it and found the reverse osmosis removed the viruses. We felt this to be a major breakthrough in the technology. What we needed then was something that would provide a clean water for the reverse osmosis in aquaculture. This seems to be it.

Mr. PACKARD. Would the gentleman yield?

Mr. WEBER. I yield to the gentleman from California.

Mr. PACKARD. I think it would be helpful for members of this subcommittee and the committee to have some of the latest information on your project. I have read some very interesting background and current material on it. It is an exciting innovative idea that has been tested now to the point where I think it is virtually operational or could be. It might be helpful if that information were made available.

Mr. KING. I would be happy to do that.

[The information requested had not been received by the Subcommittee at time of publishing.]

Mr. ROE. Further questions?

Mr. WEBER. No more questions, Mr. Chairman.

Mr. ROE. The gentleman from Oregon.

Mr. SMITH. I think you make a strong case, especially for the emergency nature of the problem.

One can't help but recall the debate in the Congress, however, regarding our additional $8.5 billion to the IMF, and recall also that huge amounts of the IMF funding to South America, Mexico in particular—and obviously we look at the situation in which the American taxpayer puts up $8.5 billion and then we see Mexico loaning Cuba money.

I wonder if there has been any effort to go to the Secretary of the Treasury through the IMF and at least request that this is an important problem to this country as well as to Mexico, asking for funds through the IMF kind of leverage?

Mr. HUNTER. I do know, Mr. Smith, that our Ambassador is currently embarked on a plan somewhat along the lines you have described. As I understand, he has been working with the World Bank to see if they would be amenable to making that loan. They have a division that makes loans on sewage projects. He is working along that line and of course that will require the cooperation of the Mexican Government because they are the people making the loan and the people to be paying it back.

So I think the situation described by myself and by the Senator, particularly with respect to the fact that we will be building a desalinization plant that we will pay $500 million for to send them clear water, and we get raw sewage, all indicates it is not an equitable or fair situation. But I do not think it is going to be realistic to see them being in the financial position they are in to be able to pick up the tab for this entire project.

We should work with them, however, and we should use leverage with them as we go down the line. Perhaps we should slow the desalinization funding as we fund this operation. But I think it is very important that we take this first step and that we provide the leadership.

We have waited for them for many years to take action and they have told us that they would do it in the near future, and this action has not taken place.

Mr. ROE. We want to thank you very much for a very solid presentation. I think you have given us the background we need to consider this issue and we will work on it.

Mr. HUNTER. We appreciate, Mr Chairman, the time that you have given us for participation of our members and colleagues.

Mr. ROE. Our next witnesses are Hon. Richard Ottinger, Hon. Hamilton Fish, and Hon. Gerald Solomon.

We want to welcome our distinguished Representatives from New York, and extraordinary leaders in the area of the environment. You have made enormous contributions to this Nation of ours. We are pleased to have you with us. What you add to our deliberations is of great help to us in determining the direction of this legislation.

Having said that, we welcome you.

The full text of your prepared statements will appear in the record at this point.

[Prepared statements referred to follow:]

PREPARED STATEMENT BY REPRESENTATIVE RICHARD L. OTTINGER OF NEW YORK

Mr. Chairman, I would like to address the PCB contamination of the Hudson River, a threat to public health that we have sought to eradicate since the early 1970's.

This subcommittee moved decisively to clean up the Hudson in the Federal Water Pollution Control Act of 1980. But our efforts have been thwarted by the repeated obstacles placed, apparently deliberately, by the former administration of the Environmental Protection Agency.

I believe it is imperative that you act in the Federal Water Pollution Control Act of 1983 to insure finally that this contamination is rendered harmless. And I ask you to conduct close oversight of EPA actions to carry out a clear mandate from Congress on this.

Let me provide the background:

THE PROBLEM

For about 25 years, until 1977, General Electric's capacitor manufacturing plants at Fort Edward and Hudson Falls discharged thousands of tons of PCB's (polychlorinated biphenyls) into the Hudson River. It is estimated that more than 600,000 lbs. of PCB's are in the Hudson River today.

PCB's are an acute health risk. They enter the body through eating, through breathing and through the skin. The International Agency for Research on Cancer reports PCB's to be carcinogenic in animals. There is evidence that pregnant women exposed to PCB's have much higher incidents of birth defects, still births and genetic deviations. Long term exposure will lead to liver abnormalities as well. As PCB's accumulate in the body thay cause skin lesions, nausea, vomiting and respiratory distress.

EPA, itself, has determined PCB's to be a health hazard. As early as 1978 it declared PCB's to be a "priority toxic pollutant". It has also determined PCB's to be a "hazardous material" under TOSCA (Toxic Substance Control Act) as well as a "hazardous waste constituent" in 1980.

THE SOLUTION

In October 1976 New York State established the PCB Settlement Advisory Committee of leading experts on PCB's. It conducted a thorough study of this problem for seven years. It proposed, and EPA concurred, dredging or rendering harmless all known PCB hot spots. The committee further proposed that a site located in Washington County be used to "encapsulate" the dredge spoils. This could be done on this site because it consists mostly of clay, a relatively impermeable material and, therefore, a natural barrier to water migration. A clay cap over the top would provide complete enclosure. Any water filtered through the site would be collected by an underdrain, analyzed and, if necessary, treated. PCB's are known to adhere to sediment particles, therefore it is unlikely that the chemical would travel with migrating water. Additionally, 18 inches of heavily seeded top soil would be maintained on the site to cover the clay cap and prevent its exposure to the elements.

In September 1978, New York State Department of Environmental Conservation applied to the U.S. EPA for a section 201 grant for $30.5 million to dredge and encapsulate the PCB contaminated sediments. EPA ruled that the project was ineligible under the construction grants program.

In November 1978, N.Y. DEC applied to EPA for funds under the provisions of both section 105, reclamation-demonstration, and section 115, removal of in-place toxic substances. EPA rejected the project for lack of funds although the proposed project was deemed to be within the provisions of these sections.

In 1980, Congress amended title I of the Federal Water Pollution Control Act (Clean Water Act) to direct the Administrator of EPA to negotiate a section 201 grant with N.Y. DEC the project. In that act Congress authorized $20 million for this "demonstration project."

Finally in September, 1982, just two months earlier, an environmental impact statement for the project was approved by the regional administrator of EPA. Yet three months later, in December, 1982 then EPA Administrator, Anne Burford, declined to spend the money authorized for the project and instead determined that PCB contamination of the Hudson River was a project better suited to Superfund than the Clean Water Act section 201, as specified by Congress.

EPA's justification for not funding the project under section 201 of the Clean Water Act was because of report language that indicated that if a "more appropriate source of funding for this clean-up effort" was available it should be utilized even though Superfund was designed to clean up land waste dumps, not to dredge rivers.

After having the project listed on the national priority list—which, is something that only happened this past month. A remedial action master plan is now being prepared for this project by EPA. This is the first step in the Superfund process and has occurred because of continued congressional clamor.

EPA's red tape torrent would be less exasperating if we were finally on our way to cleaning up the Hudson. But EPA has fully intended all along to defy Congress and kill the project. In the course of a lawsuit by Scenic Hudson et al. against EPA seeking to require it to commence clean-up, documentation has surfaced which reveals this clear intent. For example, as early as September 1981 an internal EPA memo from Jeff Zelikson, of the N.Y. EPA office discusses a meeting that took place between John Hernandez, Deputy Administrator and Congressman Solomon. That memo said:

"The availability of 'Superfund' money for the PCB project per se would not necessarily equate to the availability of $68 million in 'Superfund'. In other words 'Superfund' money is available which knocks out 201 money but is not available for the PCB project."

This indicates that an internal EPA decision had been made to kill the project using the theoretical availability of 'Superfund' as a ruse.

In addition the lawsuit disclosed notes from a meeting in November 1981 in which Ms. Burford expressed the hope that the New York State Industrial Hazardous Waste Facility Siting Board "will kill it" (meaning the project). We also have notes from a July 1982 meeting when Dewling, acting regional administrator, states that "the Administrator wants to stop project."

This deliberate thwarting of Congress and failure to address an important health hazard is intolerable.

Thirty-one Members of Congress from both the New York and the New Jersey delegations recently appealed to the current Administrator of EPA William Ruckelshaus, to commence immediate work on dredging the PCB's. We proposed that EPA begin the dredging immediately under section 201 of the Clean Water Act and that Superfund be used for what it was intended, cleaning up the hazardous waste that

would be generated on land by the dredging operation. We await his reponse, which has been promised by the end of September.

Mr. Chairman, three years after you acted to solve this problem, no action has been taken to remove the PCB's in the Hudson. I now ask your help to end this threat to public health. I respectfully request that your committee closely investigate EPA's refusal to carry out the mandate Congress gave it and that you include language in the Federal Water Pollution Control Act of 1983 that will mandate the cleanup of the Hudson in the event that EPA fails to act by the expiration of the Act on September 30th.

Sept. 16, 1981

Connie,

Shelly Holm had a telephone conversation with Jack Weber from the Headquarters Office of Congressional Affairs.

Weber attended a meeting that took place with Hernandez and Solomon.

In that meeting Hernandez said that HQ would let us go forward with the final EIS but say that 'Superfund' money not 201 funds would have to be used to finance the project

The availability of 'Superfund' money for the PCB project per se would not necessarily equate to the availability of $68 million in Superfund. In other words 'Superfund' money is available which knocks out 201 money but is not available for the PCB project.

I am going to get time on Dick's calendar for early next week (Monday, if possible) to see if we can get something definitive from HQ by having Dick call Wil Field or Hernandez.

Summary Mtg w/ Gorsuch
on Mon 11-30-81

Haddon, Field,
Fearnley

- Dick recommended 201 $1 now
- What Field says re 201 money because other $ crisis
- Gorsuch feels siting board will hold it / Dick doubts
- We could delay project based on insurance policy
- Dick recommended if political decision to go or not to go
- Rich answered ocean dumping question, incin, sed
- EIS may have to go thru "filter process"
- Uncomfortable w/ getting on land
- Do not push siting board issue.

Dick thanks everyone

PCB Project (Mtg w/ Dick Dowling, J Marshall, K Callahan, B Mudzynski)

- Dowling - Admin. wants to drop project
  - Money could not be rolled back to NYS for general grants, etc.
- Considerations
  - Funding issue not to be addressed in EIS
  - Fens & Pondsbrooke storage - already have several sites around country.
  - Rate of Recovery - 30% removal not enough to determine rate.
  - Burden of Proof - higher std of protection issue variance given by RA needed therefore how can a statement of higher degree of protection (Con landfill show it provides a higher std of protection)

- Bell - challenge Vanvalen's decision regarding use of the $20M by NYS. Only basis to kill project should be over lack of confidence that a higher degree of protection will be provided.

- Walka (phone) - The $40M project is preferable There is a variable danger of

uncertainty with the $20M project.
Can look not gain with $20M project.
No guarantee that the $40M project
will provide a higher degree of
protection. Peer review also raises
some reasonable uncertainty.

Alternative project - continue with
a monitoring program.

Prepared Statement of Hamilton Fish, Jr., of New York

Mr. Chairman and members of the Subcommittee. Congressman Ottinger has already outlined the background of the PCB Reclamation Project and its ill-fated history. I would like to focus my remarks on the need for the continuing authorization for this project in the Federal Water Pollution Control Act.

In 1980, Congress obligated funds for the Environmental Protection Agency to clean up PCB hot spots in the Upper Hudson River. This was done by amending Title I of the Federal Water Pollution Control Act and directing the Administrator of EPA to negotiate a section 201 grant with the New York State Department of Environmental Conservation for removing and encapsulating PCB contaminated sediments from these hot spots.

In December of 1982, a decision was made by EPA that this project was more suitable funded under the Superfund legislation even though this was not the intent of Congress. Despite that ruling this project was not placed on the Superfund list or National Priority List until one month ago. Even this does not ensure the cleanup of this toxic waste from the Hudson River; in fact, the General Accounting Office has reported that it takes an average of 3 years for the EPA to come to a decision on a Superfund targeted project much less clean it up. Only 2 projects in the history of Superfund have been funded in Region II which includes New York, New Jersey, the Virgin Islands, and Puerto Rico.

Needless to say, we cannot afford to waste time. The flow of the PCBs down river has increased with last Spring's heavy rains. A recent Boston Globe article cites high levels of PCB contamination in the Blue Fish and Striped Bass in Massachusettes and other areas of New England resulting possible from the fact that both of these fish pass the mouth of the Hudson in northern migration.

A U.S. Geological Survey has reported that during certain time periods in the Spring of this year, one hundred pounds per day of PCBs washed over the Troy Dam. The survey also showed that the scouring done by natural river low conditions has re-exposed PCB sediments allowing this toxic chemical to move freely downstream.

Mr. Chairman, 6 towns get their drinking water directly from the Hudson River: Rhinecliff, Port Ewen, Waterford, Red Hook, Highland, and the city and part of the town of Poughkeepsie. I cannot emphasize strongly enough the great need to remove this toxic substance from the Hudson and reauthorize the $20 million which Congress authorized in 1980. I also support Congressman Ottinger's request for a formal inquiry into the EPA's handling of the PCB project. For 3 years we have been subject to questionable delays and evasive responses from the EPA regarding this project. I look forward to the removal of PCBs from the Hudson as expeditiously as possible.

Thank you.

Prepared Statement by Representative Gerald B. Solomon of New York

As the Congressman who represents one of the largest sections of the Hudson River, I have been increasingly involved in the efforts to restore this majestic waterway. I favor renewal of this valuable natural resource, but not at the expense of the health and livelihood of the people who live in the Hudson Valley. I will continue to pursue alternatives to dredging and landfilling which address both the public health and the environmental concerns which have been raised. I believe that funds should be made available under Superfund for permanently capping PCB hotspots in the river and for the construction of activated carbon filtration systems to replace outdated water systems along the Hudson River.

Capping the hotspots in place would prevent additional PCBs from entering the water column of the lower Hudson and would eliminate the environmental and health risks associated with dredging and landfilling. Limited capping and monitoring of the hotspots could be conducted to determine the feasibility of a full scale capping project.

Dredging and landfilling PCB's is the wrong solution. Environmental experts agree that the Northeastern United States is totally unsuitable for landfilling because the watertable is too high. In fact, the watertable at the proposed landfill in Ft. Edward would be less than 5 feet from the bottom of the landfill.

My primary concern is the health of the people I represent in the Hudson Valley. I believe that we should do everything possible to limit the contact of PCBs to the public by replacing the water filtration systems in the localities such as Port Ewen, Waterford, Hiland, and Rhinebeck. The construction of activated carbon filtration

systems designed to filter all forms of hydrocarbons such as PCBs and heavy metals would be a wiser expenditure of federal funds from a human health perspective.

Doctor Joseph O'Connor, an aquatic toxicologist with New York Medical University, strongly supports the approach I have outlined. Dr. O'Connor believes that dredging will unnecessarily release large amounts of PCBs into the water column of the river. He favors a capping alternative and has stated that capping can be effective in an active energy environment such as the upper Hudson. He is currently working with the Army Corps of Engineers on their successful efforts at containing capped PCB contaminated material in the ocean. The Environmental Impact Statement on the PCB Demonstration Project was completed prior to the successful capping of contaminated material by the Corps.

I would also like to comment briefly on the public concern which has been raised with respect to Section 113 of the Clean Water Act. In a letter to EPA, the President of the New York State Farm Bureau expressed the strong opposition of the Farm Bureau to the PCB Demonstration Project. His letter states, "The recommendations which were not supported by all members of the PCB study committee, has met violent local opposition. All local legislative bodies, town, municipal and county, have publicly opposed the project as well as citizen groups and the farm community through their Farm Bureau organizations."

On April 21, 1982, the Greene County Legislature approved a resolution expressing their concern that the PCB proposal to expend over $25 million for dredging less than 25% of the PCBs deposited in the river will result in the stirring up of otherwise dormant chemicals into the water column. Their resolution, approved 12 to 0, states that the dredging may jeopardize the drinking water in localities along the Hudson River.

On April 28, 1982, the Saratogian newspaper stated, "Not only would the huge PCB dump pose a potential hazard to farmers and residents but it would likely lead to prolonged and costly lawsuits down the road if farmers seek restitution for damaged crops or milking cows contaminated by the toxic waste. The plan to dump the PCBs in this area is extemely ill-advised and goes directly against the wishes of the people who will have to live with it."

In addition, there is a major legal problem concerning the proposed landfill. A recent court decision prohibits the use of the landfill identified and selected by the State Department of Environmental Conservation. In other words, there is no landfill to dump the PCB dredged material. This may mean that the contaminated material will be dumped in the New York bight, which could consequently jeopardize the New York and New Jersey Atlantic shore.

Criticism of the EPA's decision to shift funding for the project to Superfund in unfounded. Anyone who actually takes the time and effort to read the law can see EPA is acting in accordance with the Congressional intent of the Act.

Section 116(b) of the Clean Water Act states that funds allotted to New York under section 205 shall be available under this subsection only to the extent the funds are not available, as determined by the Administrator, under a comprehensive hazardous substance response and cleanup fund.

Subsection (a) contains a provision which states that no pollutants removal pursuant to this paragraph shall be placed in any landfill unless the Administrator first determines that disposal of the pollutants in such landfill would provide a higher standard of protection of the public health, safety, and welfare than disposal of such pollutants by any other method including, but not limited to, incineration or chemical destruction process.

According to Dr. O'Connor dredging PCB hotspots will compound the existing problem. By stirring up the remaining silt, the levels of PCBs downstream will be raised to a point that no future dredging of the deep water channel will be allowed. There will be no place to deposit the dredging PCB material.

It is inaccurate and misleading to imply that the failure to implement the PCB Dredging Project will threaten the New York harbor or impede the recovery of a national waterway. According to a 1982 report by the National Oceanic and Atmospheric Administration . . . PCBs from the hotspots in the upper river is a relatively minor contribution to the harbor sediment compared to PCBs from other sources. The report concluded that given the restrains under section 113 of the Clean Water Act the project will not demonstrate recovery of a national waterway or alter the concentrations of PCB's in the New York Harbor setiments.

The beauty and purity of the Hudson River, one of the greatest river systems in the world, must be restored. However, in their rush for federal money, some so-called environmental organizations have lost sight of this purpose. Section 116 of the Clean Water Act is an ill-planned attempt to clean up the river and ignores the

negative consequences of human health and safety. I will continue to oppose any action which endangers the public health and the agricultural pase of the region.

Mr. ROE. Please proceed.

TESTIMONY OF HON. RICHARD L. OTTINGER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK; HON. HAMILTON FISH, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK; AND HON. GERALD B. SOLOMON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK

Mr. OTTINGER. Thank you very much, Mr. Chairman. I appreciate your giving us the opportunity to testify this morning on the subject of PCB contamination of the Hudson River.

This is a great public health threat we have sought to eradicate since the 1970's. Your subcommittee moved decisively to clean up PCB's in the Hudson in the Water Pollution Control Act of 1980. Your mandate set forth in the law was deliberately thwarted by the former administration of the Environmental Protection Agency, as I will demonstrate irrefutably in a few minutes.

Unfortunately, the new EPA administration has not yet committed itself to take action. In my opinion, EPA's decision on this matter will be a good test of the commitment they have to rectify the sins of the past and carry out the law.

I believe it is imperative that you act in the Federal Water Pollution Control Act of 1983 to insure finally that this contamination is rendered harmless. And I ask you to conduct close oversight of EPA actions to carry out a clear mandate from Congress on this.

Let me give you some background.

For about 25 years, until 1977, General Electric's capacitor manufacturing plants at Fort Edward and Hudson Falls discharged thousands of tons of PCB's, polychlorinated biphenyls, into the Hudson River. It is estimated that more than 600,000 pounds of PCB's are in the Hudson River today.

PCB's are an acute health risk. They enter the body through eating, through breathing and through the skin. The International Agency for Research on Cancer reports PCB's to be carcinogenic in animals. There is evidence that pregnant women exposed to PCB's have much higher incidents of birth defects, still births and genetic deviations. Long-term exposure will lead to liver abnormalities as well. As PCB's accumulate in the body they cause skin lesions, nausea, vomiting, and respiratory distress. EPA itself has determined PCB's to be a health hazard. As early as 1978, it declared PCB's to be a priority toxic pollutant. It has also determined PCB's to be a "hazardous material" under TOSCA, Toxic Substance Control Act, as well as a "hazardous waste constituent" in 1980.

In October 1976, New York State established the PCB settlement advisory committee of leading experts on PCB's. It conducted a thorough study of this problem for 7 years. It proposed, and the EPA concurred, dredging or rendering harmless all known PCB hot spots.

The committee further proposed that a site located in Washington County be used to encapsulate the dredge spoils. This could be done on this site because it consists mostly of clay, a relatively impermeable material and, therefore, a natural barrier to water migration. A clay cap over the top would provide complete enclosure.

Any water filtered through the site would be collected by an underdrain, analyzed and, if necessary, treated. PCB's are known to adhere to sediment particles, therefore it is unlikely that the chemical would travel with migrating water. Additionally, 18 inches of heavily seeded topsoil would be maintained on the site to cover the clay cap and prevent its exposure to the elements.

Along this line, I fully understand the position taken by our colleague, Mr. Sullivan; however, there are other ways of dealing with these pollutants, such as in tanks, and so forth.

In September 1978, New York DEC applied to EPA for funds under the provisions of both section 105, reclamation-demonstration, and section 115, removal of inplace toxic substances. EPA rejected the project for lack of funds although the proposed project was deemed to be within the provisions of these sections.

In 1980, Congress amended title I of the Federal Water Pollution Control Act, Clean Water Act, to direct the Administrator of EPA to negotiate a section 201 grant with New York DEC the project. In that act, Congress authorized $20 million for this demonstration project.

Finally in September 1982, an environmental impact statement for the project was approved by the regional administrator of EPA. Yet 3 months later, in December 1982, then EPA Administrator Anne Burford declined to spend the money authorized for the project, and instead determined that PCB contamination of the Hudson River was a project better suited to Superfund than the Clean Water Act section 201, as specified by Congress.

EPA's justification for not funding the project under section 201 of the Clean Water Act was because of report language that indicated that if a more appropriate source of funding for this clean-up effort was available, it should be utilized even though Superfund was designed to clean up land waste dumps, not to dredge rivers.

After having the project listed on the national priority list, which is something that only happened this past month, a remedial action master plan is now being prepared for this project by EPA. This is the first step in the Superfund process and has occurred because of continued congressional clamor.

EPA's redtape torrent would be less exasperating if we were finally on our way to cleaning up the Hudson. But EPA has fully intended all along to defy Congress and kill the project. In the course of a lawsuit by Scenic Hudson, et al., against EPA seeking to require it to commence clean-up, documentation has surfaced which reveals this clear intent.

For example, as early as September 1981, an internal EPA memo from Jeff Zelikson of the New York EPA office discusses a meeting that took place between John Hernandez, Deputy Administrator, and Congressman Solomon. That memo said:

> The availability of Superfund money for the PCB project per se would not necessarily equate to the availability of $68 million in Superfund. In other words, Superfund money is available which knocks out 201 money but is not available for the PCB project.

This indicates that an internal EPA decision had been made to kill the project, using the theoretical availability of Superfund as a ruse.

In addition, the lawsuit disclosed notes from a meeting in November 1981 in which Ms. Burford expressed the hope that the New York State Industrial Hazardous Waste Facility sitting board will kill it, meaning the project. We also have notes from a July 1982 meeting when Dewling, Acting Regional Administrator, states that "the administrator wants to stop the project."

I am submitting these documents to the committee because they produce irrefutable evidence that the EPA was intent on thwarting the will of Congress.

Thirty-two Members of Congress from both the New York and the New Jersey delegations recently appealed to the current Administrator of EPA, William Ruckelshaus, to commence immediate work on dredging the PCB's. This included three Senators from the area and most of the Congressmen from the area.

I have a copy of that letter which I would submit for the record.

Mr. ROE. Without objection, so ordered.

[Copy of letter follows:]

CONGRESS OF THE UNITED STATES,
HOUSE REPRESENTATIVES,
Washington, D.C., July 27, 1983.

WILLIAM D. RUCKELSHAUS,
Administrator, Environmental Protection Agency,
Washington, D.C.

DEAR BILL: We would like to thank you for taking the time to meet with us today. We believe that this meeting afforded an excellent airing of all of the opinions on the complicated subject of PCB contamination of the Hudson River.

We would like to reiterate a proposal made at the meeting today, which we believe has great merit and should be seriously considered by the Environmental Protection Agency.

In 1980 Congress obligated funds for EPA to clean up PCB 'hot spots' in the upper Hudson River. This was done by amending Title I of the Federal Water Pollution Control Act and directing the administrator of EPA to negotiate a section 201 grant with the New York State Department of Environmental Conservation for removing and encapsulating PCB contaminated sediments from these 'hot spots'.

December 1982 a decision was made by EPA that this project was more suitably funded under the Superfund legislation. While this was clearly not the intent of Congress, we would all like to see the problem dealt with as expeditiously as possible. Therefore we would propose that EPA settle the outstanding suit regarding the use of section 116 funds, use the funds already allocated to perform the dredging operation, and use the Superfund to fund the ultimate disposal of the waste by construction of incinerators or other disposal methods.

We have every confidence the State of New York will provide adequate temporary storage facilities for the dredged spoils.

It is clear that all of the members of Congress who were present, and many who were unable to attend, consider this issue to be of prime importance. Congress has indicated that it wants strong and immediate action taken to reduce the contamination of the Hudson River. The health and well-being of the people who live, work and play along the shores of the Hudson must be protected. It is important that we protect the environmental integrity of the river if we are to have a river into the next century.

We would like to request that you consider this proposal seriously. We believe that it is a compromise in the best interests of the people that we all serve. Because of the September 30th expiration of the authorizations under section 116 of the Clean Water Act, we request an answer by August 5, 1983 as to the feasibility of these suggestions.

Sincerely,

Richard Ottinger, Hamilton Fish, Jr., Daniel Moynihan, Bill Bradley, Frank Lautenberg, Stan Lundine, Robert Roe, James Howard, Matthew McHugh, Tom Downey, Benjamin Gilman, Robert Mrazek, Sherwood Boehlert, Joseph Addabbo, James Scheuer, Ted Weiss, Stephen Solarz, Edwin Forsythe, Charles Rangel, Geraldine Ferraro, Frank Horton, Charles Schumer, Samuel Stratton, Edolphus Towns, Raymond McGrath, Gary Ackerman, Mario Biaggi, Bill Green, John LaFalce, Henry Nowak, Robert Garcia, Major Owens.

Mr. OTTINGER. We proposed that EPA begin the dredging immediately under section 201 of the Clean Water Act and that Superfund be used for what it was intended, cleaning up the hazardous waste that would be generated on land by the dredging operation. We await his response, which has been promised by the end of September.

Mr. Chairman, 3 years after you acted to solve this problem, no action has been taken to remove the PCB's in the Hudson. I now ask your help to end this threat to public health. I respectfully request that your committee closely investigate EPA's refusal to carry out the mandate Congress gave it and that you include language in the Federal Water Pollution Control Act of 1983 that will mandate the cleanup of the Hudson in the event that EPA fails to act by the expiration of the act on September 30.

I and Mr. Fish, who initiated this, feel this matter should be undertaken immediately.

Last, I would like to say that Congressman Solomon has suggested the possibility of somehow or other covering up these PCB's. The scientific evidence on that—would that it can be done because it would be a lot cheaper—indicate that it would be totally infeasible. It would increase the rapidity of the flow over the area covered and carry the PCB's on to the banks and aggravate the situation rather than solving it.

Thank you very much for your interest and your patience.

Mr. ROE. Congressman Fish.

Mr. FISH. Thank you, Mr. Chairman and members of the subcommittee. Congressman Ottinger has already outlined the background of the PCB reclamation project and its ill-fated history, and the communication of July 27, which was submitted for the record, in which the suggestion is made that the funds available currently should be allocated to the dredging operation, and the Superfund to fund the ultimate disposal of the waste by destruction in incinerators that are presently in a pilot project by the EPA, should be instituted.

We think this is a sensible alternative but in the event that does not take place in the next few days, we need this reauthorization legislation.

I would like to focus my brief remarks on the need for the continuing authorization for this project in the Federal Water Pollution Control Act.

The December 1982 decision by EPA that this project was more suitably funded under the Superfund legislation clearly in our judgment violates the intent of the Congress. Despite that ruling, this project was not placed on the priority list until a month ago. Even this does not assure cleanup of the wastes from the Hudson River.

The GAO estimates that it takes 3 years for the EPA to come to a final decision on the project much less clean it up. Only two projects have been funded in region 2 which includes New York, New Jersey, Virgin Islands, and Puerto Rico, a region notorious for the number of projects on the Superfund list.

Needless to say, we cannot wait for this period of time.

The flow of PCB's downriver has increased with last spring's heavy rains. A recent Boston Globe article sites high levels of PCB contamination in the blue fish and striped bass in Massachusetts and other areas of New England resulting possibly from the fact that both of these fish pass the mouth of the Hudson in northern migration.

A U.S. Geological Survey has reported that during certain time periods in the spring of this year, 100 pounds per day of PCB's washed over the Troy Dam. The survey also showed that the scouring done by natural river flow conditions has reexposed PCB sediments allowing the toxic chemical to move freely downstream.

Mr. Chairman, I have represented no less than four Hudson Valley districts in my time in the Congress, and I think it is significant that six municipalities along that river get their drinking water directly from the Hudson: Rhinecliff, Port Ewen, Waterford, Red Hook, Highland, and the city and part of the town of Poughkeepsie. I cannot emphasize strongly enough the need to remove this toxic substance from the Hudson and reauthorize the $20 million which Congress authorized in 1980.

I also support Congressman Ottinger's request for a formal inquiry into EPA's handling of the PCB project. For 3 years we have been subject to questionable delays and evasive responses from EPA on this matter. I look forward to removal of the PCB's from the Hudson as expeditiously as possible.

Thank you, Mr. Chairman.

Mr. ROE. Tell us what your thoughts are, Mr. Solomon.

Mr. SOLOMON. Thank you, Mr. Chairman.

It is good to be back in my old committee. Sometimes I wish I were still here, especially at this time.

Mr. Chairman, let me just try to outline my position as it was when I was on this committee and in which the committee worked closely with me. As the Congressman who represents one of the largest sections of the Hudson River, I have been increasingly involved in the efforts to restore this waterway and I favor renewal of this valuable natural resource, but not at the expense of the health and livelihood of the people who live in the Hudson Valley. I will continue to support the efforts in dredging and landfilling.

I believe strongly funds should be made available under Superfund for permanently capping PCB hotspots in the river and construction of activated carbon filtration systems to replace outdated water supply systems along the river in the six municipalities that Mr. Fish mentioned.

Capping the hotspots in place would prevent additional PCB's from entering the water column of the lower Hudson and would eliminate the environmental and health risks associated with dredging and landfilling. Limited capping and monitoring of the hotspots could be conducted to determine the feasibility of a full scale capping project.

Dredging and landfilling PCB's is the wrong solution. Environmental experts agree that the northeastern United States is totally unsuitable for landfilling because the water table is too high. In fact, the water table at the proposed landfill in Fort Edward would be less than 5 feet from the bottom of the landfill.

My primary concern is the health of the people I represent in the Hudson Valley. I believe that we should do everything possible to limit the contact of PCB's to the public by replacing the water filtration systems in the localities such as Port Ewen, Waterford, Highland, and Rhinebeck. That can be done under Superfund, it cannot be done under the Water Pollution Act.

The construction of activated carbon filtration systems designed to filter all forms of hydrocarbons such as PCB's and heavy metals would be a wiser expenditure of Federal funds from a human health perspective.

Dr. Joseph O'Connor, an aquatic toxicologist with New York Medical University and one of the renowned experts in this field, strongly supports the approach I have outlined. Dr. O'Connor believes that dredging will unnecessarily release large amounts of PCB's into the water column of the river. He favors a capping alternative and has stated that capping can be effective in an active energy environment such as the upper Hudson. He is currently working with the Army Corps of Engineers on their successful efforts at containing capped PCB contaminated material in the ocean.

I know you are very concerned about that, Mr. Chairman.

The environmental impact statement on the PCB demonstration project was completed prior to the successful capping of contaminated material by the corps.

I would also like to comment briefly in the public concern which has been raised with respect to section 113 of the Clean Water Act. In a letter to EPA, the president of the New York State Farm Bureau expressed the strong opposition of the Farm Bureau to the PCB demonstration project. His letter states, "The recommendations which were not supported by all members of the PCB study committee, has met violent local opposition. All local legislative bodies, town, municipal, and county, have publicly opposed the project as well as citizen groups and the farm community through their Farm Bureau organizations."

In addition there was a major legal problem concerning this landfill. This has to do with the landfill. A recent court decision prohibits the use of the landfill indentified and selected by the State department of environmental conservation. In other words, there is no landfill to dump the PCB dredged material. This may mean that the contaminated material will be dumped in the New York bight, which could consequently jeopardize the New York and New Jersey Atlantic shore.

Criticism of the EPA's decision to shift funding for the project to Superfund is unfounded. Anyone who actually takes the time and effort to read the law—as you and I have written it—can see EPA acting in accordance with the congressional intent of the act.

Section 116(b) of the Clean Water Act states that funds allotted to New York under section 205 shall be available under this subsection only to the extent the funds are not available, as determined by the administrator, under a comprehensive hazardous substance response and cleanup fund.

In addition, Mr. Chairman, when Mr. Moynihan offered the pilot project and it was accepted in the Clean Water Act, I amended his

pilot project and inserted this language which was unanimously accepted by the Congress in both Houses.

It states, subsection (a) contains a provision which states that no pollutants removed pursuant to this paragraph shall be placed in any landfill unless the administrator first determines that disposal of the pollutants in such landfill would provide a higher standard of protection of the public health, safety, and welfare than disposal of such pollutants by any other method including, but not limited to, incineration or a chemical destruction process.

According to Dr. O'Connor dredging PCB hotspots will compound the existing problem. By stirring up the remaining silt, the levels of PCB's downstream will be raised to a point that no future dredging of the deep water channel between New York and Albany will be allowed. There will be no place to deposit the dredged PCB material.

Now this next point is important to you, Mr. Chairman, and other members in the New York-New Jersey area.

It is inaccurate and misleading to imply that the failure to implement the PCB dredging project will threaten the New York harbor or impede the recovery of a national waterway. According to a 1982 report by the National Oceanic and Atmospheric Administration, PCB's from the hotspots in the upper river is a relatively minor contribution to the harbor sediment compared to PCB's from other sources; namely, in the New York City area. The report concluded that given the restraints under section 113 of the Clean Water Act the project will not demonstrate a recovery of a national waterway or alter the concentrations of PCB's in the New York harbor sediments.

Mr. Chairman, you were at a meeting when Mr. Ruckelshaus stated that according to EPA records, 85 percent of the PCB problem in the New York City area was caused by pollutants coming from the New York City area and only 15 percent from the upper Hudson hotspots we are talking about here today.

That means that under the dredging project if we were to remove the 25 percent of the PCB-laden silt in the upper Hudson, if we removed just 25 percent of it, that means we would only remove 2 percent of the problem and if we are going to spend that kind of money maybe we ought to be taking that money now in the 205 funds for cleaning up the sewage that is being dumped in the rivers now, maybe that is where it ought to be.

If we keep diverting funds through these projects you will never solve your problem in New York City and New Jersey. That is why if you want to examine why this project was turned down, read the legal opinion by the EPA. Mr. Ruckelshaus said it would be very difficult for us to change that legal opinion because it was a legal opinion. I think if we are going to solve this problem perhaps we ought to look at it through Superfund and I think we will recover the Hudson River faster than the continued problems we are going to have with this through court actions that are going to continue to delay it for several years more.

Mr. ROE. We want to thank you for your other views. I know you have to go.

Mr. SOLOMON. They are calling me for a vote and I will be back to answer any questions.

Mr. ROE. Go right ahead.

Let me suggest—are there questions of the members by the way?

One thing I think we ought to get our act together on is that I happen to think that all your testimony has been excellent. We are all faced with the same problem. I come from New Jersey, as you know we have been through all the meetings, we have listened to all the drivel from the beginning. But let's get on with it. It has now been 3 years. I appreciate Jerry's point of view and I won't quarrel on the technical aspects or environmental aspects but we have to get one act together on the point of laying out what we will do, and evolve the technical decisions as we go but let's have a policy.

There isn't any policy at this time.

I think your testimony, Dick, and Ham, in relation to your followup on the point of view that we did move in that direction, that was very carefully worked out to get them to move. Then we go through the drill of, OK, you know, it will be in Superfund and whatever. But Superfund doesn't have the money, nor the expertise and we have been through that drivel.

But I think we should talk amongst ourselves as to language with the support of our colleagues from other parts of the country which I know we will support, we need a direction on this and a decision and policy. Isn't that fair commentary? And some confirmed action?

Mr. OTTINGER. I, if I may, Mr. Chairman, agree with you. We need a start on action on this. While our colleague from New York is correct that this will not resolve the whole problem you will never get the whole problem resolved unless you start somewhere.

We had an expert committee address this problem over a period of 7 years. They considered the questions that Dr. O'Connor raised and they determined the PCB's would not migrate as a result of the dredging. They determined that capping it would not be a solution but would contribute greater problems to us.

What we would like to do is see a start made.

One of the great ironies is that you and I from the time I came to Congress made a great campaign to clean up the Hudson River. We passed compact legislation here, we got sewage treatment plants built. Lo and behold the fish that had not disappeared from the Hudson came back.

Mr. ROE. Because of what we are doing, I am sure.

Mr. OTTINGER. The shad industry that thrived along the Hudson returned and now we are in a situation where the fishermen on the Hudson cannot sell the fish they catch because of the contamination by PCB's.

The fish have returned but they are contaminated. Today the people along the river are jeopardized, as Congressman Fish so aptly demonstrated, with communities actually taking drinking water from the PCB-contaminated area where you cannot even fish.

I would like to see a commitment from EPA to start cleaning up this problem.

Mr. ROE. If the gentleman would yield, let me point something out. We have received testimony on this—voluminous testimony

I have been here 14 years, but I would like to see something get done before I die. I don't know where the 14 years went. But basically the testimony, and we have reams of it that we have taken in the Water Resources Development Act—bear with me a second—together with the testimony we took from New York yesterday together with your views and our colleagues' views which we respect and understand. But the problem is this, yesterday they testified they needed $16 billion of which about $12 billion is needed almost immediately, and if they don't go into secondary treatment and have a sort of by year type of semiannual thing they would pass part of the secondary treatment back into the ocean.

We just held hearings in the spring vis-a-vis the capsulation portion along the bight. We just passed legislation unanimously in the interest of New York City and the country and that was a series of actions to be taken in the water resources development aspects. So we have a picture.

The irony is that unless we solve the ocean dumping situation there is not going to be any dredging per se in the Hudson River because it will just not be able to go ahead.

We are coming back and saying the environmental integrity of the Hudson River, and all the things we are doing to it both on my side of the river and your side of the river, have to be handled as a policy. We have to come back and say, well, let's make the policy but let's do something rather than sit there for another 7 years.

One day I would like to have an investigative hearing and I would like to isolate out of the billions of dollars that we have allocated and appropriated for EPA and for the Corps of Engineers and I would like to see how much has gone into studies, No. 1, which goes to the billions, hundreds of billions anyway; and we ought to see the timeframe. If it took 30 years or 18 years to get a project done, they have—we have, the Congress, because of delay, have increased the cost of those projects 500-fold and it is not getting the job done and that is your concern.

It is your concern, Jerry, and we understand it, you said it very well.

I would hope through the work we do and get the support of the Congress as we did on the water resources bill, and we get to a language for national policy on that. That is what we need. Frankly, other areas of the country and I have done a lot of study on this, are ahead of us in coordination of their delegations. I hope we can get something to emerge.

We want to thank you because you contributed heavily to our concern.

Jerry, when you went out we said let's nail down a policy position so we can—we can disagree on elements of it but a policy has to be established which I think you would buy.

Are there any other questions.

If not, colleagues, we thank you very, very much for your patience and very valued testimony this morning. It is most helpful to us.

In view of a transportation problem and a governmental problem, we are going to now call the Honorable Wayne Bryant, Assemblyman from the State of New Jersey, who has to get a plane

in a few minutes to fly back for a session of the New Jersey Legislature.

TESTIMONY OF HON. WAYNE BRYANT, NEW JERSEY ASSEMBLYMAN

Mr. ROE. We welcome you to our committee. We appreciate your effort of getting here and getting back.

I know you are in session so if you would go ahead.

Mr. BRYANT. I appreciate that, Congressman Roe.

Good morning Congressman Roe and distinguished members of the Subcommittee on Public Works.

I am Wayne Bryant, the State Assemblyman from the Fifth Legislative District in New Jersey.

It is an honor to be here today, representing the leadership of the New Jersey General Assembly. We in New Jersey have a particular interest in the proposal to reauthorize the Clean Water Act of 1972.

First of all, this bill has been sponsored by one of our Congressmen, Jim Howard. We are grateful to Congressman Howard for his tireless support of environmental legislation in New Jersey and nationwide.

And it is a pleasure to discuss this proposal with another fellow New Jerseyean—Chairman Bob Roe. We are thankful that you, too, share our concerns for the environment.

While all my colleagues in New Jersey support the reauthorization of the Clean Water Act, I represent a district that has a particular interest in this program. Camden County, part of which lies in my legislative district, is about to embark on its first project to be funded under the auspices of the Clean Water Act. We are the last major urban project left to be funded in New Jersey, and we are thankful that our turn has finally come.

Our project is being funded through the construction grant project authorized by the Clean Water Act.

I would like to return to a discussion about the Camden County project and the construction grants program later in my testimony. First, though, I would like to talk about some of the other provisions of this reauthorization proposal.

Congressman Howard has proposed amendments that will fine-tune what is basically an environmentally sound act.

These amendments are in response to political realities, technological developments and increased knowledge in the areas of water pollution control over the past 10 years.

I would like to highlight some of these amendments and speak briefly about a new proposal within the bill, that of estuary/bay management.

Discharge waivers for municipal treatment plants. The Environmental Protection Agency, region 2, recently denied applications for waivers eliminating secondary treatment of all sewage discharges from over 19 municipalities in the New York/New Jersey metropolitan region.

Because over 170 million gallons per day of raw sewage is being dumped into the Hudson River this was a major step in achieving the goal of the Clean Water Act. But the possibility for future

waivers must be eliminated in order to end the lethal pollution of this national resource.

Congressman Howard has wisely foreseen the need to close the loophole in the existing law which gives EPA the discretion to grant these waivers. This proposal greatly limits the number of municipalities that would be exempt from strict treatment requirements.

If the goals of the Clean Water Act are ever to be achieved we must enact and enforce the strict treatment requirements for municipally generated sewerage.

Downgrading of designated areas of bodies of water. The goal of the 1972 Clean Water Act is "fishable, swimmable waters by 1983." We are far from that goal. Any attempt to permit the downgrading of designated uses of bodies of water as proposed by EPA, including already existing high quality water, strikes at the heart of this goal.

Congressman Howard's amendments in this area would prohibit the altering of standards by which a State may change the designation of a stream classified for such uses as fishing, agriculture or industry.

They, in fact, go farther, by requiring that States upgrade a designated use for a body of water if the water quality exceeds the existing use.

It is only with measures of this type that we can assure that the destruction of our vital and irreplaceable water resources will not continue.

Estuary/bay management. Congressman Howard has included an important new proposal in his amendments. It is one that recognizes the need for a cooperative effort among States for the protection and development of shared water resources.

This amendment calls for the convening of a management conference whenever it is determined that an estuary area is being contaminated from more than one State.

In New Jersey we have two main bay areas that are vital to both the economic and environmental life of the State.

But they are also vital to our neighboring States of Pennsylvania, Delaware, and New York.

As we compete with these States in the race for economic development we must not forget that economic development and environmental protection are compatible, and mutually beneficial.

As proposed, these management conferences would ease the often difficult task of obtaining a cooperative effort among States to achieve both maximum environmental protection and economic benefit for all.

I wholly support the concept of federally directed estuary management.

I would like to return to a discussion of the construction grant program and commend the sponsor on his attempts to increase the funding in this area.

Since the enactment of the Clean Water Act of 1972 the State of New Jersey has participated in the Federal Water Pollution Control program.

Over the last 9 years, about $1.8 billion of Federal funds have been obligated in New Jersey for the construction of nearly $2.4

billion worth of wastewater treatment projects. In 1976, we hit a high point in our receipt of Federal wastewater construction funds. That year we received $520 million in Federal funds.

The State has also contributed to this wastewater construction program. Over the past 9 years, the legislature has appropriated approximately $270 million in State grants for water pollution control projects.

However, our current Federal authorizations represent a dramatic decline in the level of funding for this program.

New Jersey's fiscal year 1982 authorization was $85 million. We have received authorizations of $100 million a year for each of fiscal year 1983 through 1985. Only $385 million will be available through fiscal year 1985.

The current authorization will provide Federal funding at an average annual rate of less than half of the State's previous funding level.

The reduction comes at a particularly difficult time: the New Jersey Department of Environmental Protection has identified nearly $2.4 billion worth of projects which will be ready for construction within the next 4 years. That $2.4 billion represents 238 separate wastewater projects.

With our current authorization, only about 15 projects can be funded. This means that while the first stages of the pollution control projects which are constructed this year may be completed, the second and third stages will not be completed for about 20 years, if present funding levels are maintained.

This is of particular concern to me. I represent a district which will receive a grant for the first stage of a sewer treatment project. However, the second and third stages of that project are ranked number 35 and 110 on our statewide priority list. At the current funding rate, these projects won't be funded for years. The system will remain incomplete through the 1990's.

Permit me to tell you a little bit about the project in my district.

As I mentioned, I represent the city of Camden and several other municipalities in Camden County. In 1972, the Camden County Municipal Utilities Authority was organized to study, design, and construct a wastewater management system in Camden County. This is a regional system, of course.

The project was supposed to provide a new system for transporting and purifying wastewater. It was intended to alleviate the horrendous pollution problems in our streams and tributories including Haddon Lake, Newton Lake, Cooper River, Big Timber Creek, and Pennsauken Creek.

In accordance with the provisions of the 1972 Clean Water Act, the authority expected to receive a grant equal to 75 percent of the cost of this project. The State of New Jersey had adopted a program awarding 8-percent grants to be linked with the Federal program. Thus, the authority expected that 83 percent of the project costs would be paid with grant funds: 17 percent of the cost would be borne by local users.

Eligibility for project funding was and still is determined on the basis of an annual priority list established by the State's Department of Environmental Protection. This list is approved by the U.S. Environmental Protection Agency.

After 10 years of studying, designing, planning, and waiting, Camden County emerged as No. 1 on the 1982–85 priority list. For the first time we are eligible for funding. Ours is the last major regional sewer system to be undertaken in the State.

Our No. 1 priority project represents just the first stage of the treatment system. This will provide a sewer treatment plant which will serve the city of Camden. The remaining pieces, the hookups to the other communities in the county will be phased in later.

However, later for Camden County could be as far away as 20 years from now if current funding levels are maintained. If the construction grant program is eliminated, Camden County will never meet its clean water goals, and the residents of the county and surrounding areas will unfairly be penalized.

Camden County cannot afford to construct any or all of this project alone. The city of Camden, the hub of the county, is the poorest city in the State of New Jersey and among the poorest in the Nation.

Our residents, my constituents, cannot afford the user fees which would be required to construct that project without Federal assistance.

It is clear that New Jersey communities, and other cities and towns throughout the country, are relying on the Federal Government to renew its commitment to clean water goals.

These communities have been required to meet certain federally-mandated clean water standards. They have been promised the financial assistance necessary to do so.

For the most part, they can't afford to finance these projects alone and recent shifts in the Federal clean water policy have caused concerns within these towns.

The following are just mere examples of these shifts and changes in Federal policy.

President Reagan has slashed the total funding for this program from 75 percent to 55 percent of the project costs.

Planning and design grants have been discontinued.

The President has threatened to discontinue this program after fiscal year 1985.

Although Congressman Howard, Congressman Roe, and other concerned Members of Congress have vowed to continue to strengthen our Government's commitment to clean water standards, the uncertainty about the future of this program has created considerable concern at the local level. States and municipalities are attempting to devise ways to fill in the gaps.

In New Jersey, for instance, the State Department of Environmental Protection cut Federal grant funding levels from 75 percent to 65 percent of project costs 2 years ago.

This allowed the State to spread Federal construction dollars among more communities.

Beginning this year, the 8 percent State grants have been changed to loans.

Our Governor has also proposed an infrastructure bank which would be able to finance wastewater treatment projects. The bank idea has some merit as a public financing tool, but a lack of capitalization funds has prevented the bank idea from becoming a reality.

In order to provide funds to start up the bank, the Governor has recommended depositing the Federal construction grant funds in the infrastructure bank and awarding that money in the form of loans to the communities on priority list.

My colleagues in the legislature and I have fought this conversion proposal. It is our impression that the impact on the users, who would bear the entire cost of the financing would be devastating.

For instance, it is projected that the user fees for the Camden County phase I project I described earlier would double or even triple.

My colleagues and I have expressed our outrage at the inequitable fee increases that this proposal would impose, but the Governor has insisted that this is the only way to finance sewer treatment projects beyond 1985.

Clearly, that is not true. The Federal Government has been, and continues to be, committed to pollution control and clean water. The introduction of the bill we are discussing today and the increased funding this bill proposes bears testimony to the commitment of our elected representatives.

The Federal Government has historically recognized its responsibilities for contributing to the construction of the necessary treatment facilities. I, for one, am not convinced that you will walk away from us leaving the States to fend for themselves.

Our Governor, however, seems to have little faith.

I urge you to fight any attempt to permit Federal grant funds to be converted to loans.

The enormous, and overwhelmingly negative impact that such an action will have on user fees is apparent.

The inequity of changing the financing terms 10 years into the clean water program is also clear. For instance, if our Governor's proposal is accepted, some New Jersey residents will be required to pay for their clean water entirely through user fees while those whose projects were built earlier will have borne only a small portion of the costs.

It seems that New Jersey residents will be forced to borrow their Federal funds, while residents of other States continue to receive grants. The ratepayers of our State have not been given a choice in this matter; our Governor has volunteered us for this dubious honor.

I would hope that Congress recognizes the plight of the people it represents, and chooses to support its constituents and not its Governors.

Finally, the Federal Government, which raises and distributes construction funds, will lose control over the future expenditure of those funds. Second generation funds, those generated by loan repayments, will be controlled by the States.

This second generation money could be spent on a variety of projects, none of which are related to the original objective of water pollution control.

In closing, I must thank Congressman Howard for continuing his fight for clean water in New Jersey and elsewhere. His bill to reauthorize the Clean Water Act is indeed necessary. New Jersey,

20-955 O—84——33

and the rest of the States, have used their previous funds wisely and well. But vast needs still remain.

Because of these needs, I must once again ask you to guard against attempts to turn these grants funds into loans. The reauthorization of the Clean Water Act represents a commitment to pollution control, and a commitment to the people of the Nation, which should not be altered. The inequities which will arise if such conversions are permitted are limitless.

I would like to thank the committee for allowing me to testify before them on behalf of the New Jersey State Legislature.

Mr. ROE. Thank you very much. We want to thank you for a very adroit and well-organized statement. You got right to the point of the issue.

We will do what we can to protect what you have referred to.

Are there questions?

Mr. STANGELAND. I, too, want to thank Assemblyman Bryant for his statement. I don't have any questions—I would like to set the record straight so there is no misunderstanding.

On page 9 where you talk about the shifts and changes of Federal policy, the change in funding for the program from 75 percent to 55 percent was a Senate action and it was a bipartisan action in the Senate.

Also, discontinuing the planning design grants came out of the Senate the last time this bill was written.

I just wanted to set the record straight. Neither were recommended by the President.

Thank you, again, for your testimony.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

I appreciate your testimony, Assemblyman Bryant. I understand your concerns in the New York Harbor that affects New Jersey and other areas. I appreciate your interest in having Congressman Howard's bill to close some of the loopholes.

If there are harbors in the country, however, that do meet water quality standards, ought there be provisions to allow waivers of secondary treatment or other costly treatment procedures that would be allowed to be implemented in those cases where they do meet the water quality standards?

Mr. BRYANT. I think if my testimony was not clear, Senator Howard's bill includes some of those, closes some. It does not completely eliminate EPA's ability to give waivers, but it sets standards for them. But it would permit them in the areas where they meet the necessary standards.

Mr. PACKARD. Thank you.

Mr. ROE. Again, thank you, Assemblyman, for your splendid presentation in behalf of New Jersey. We will give it every consideration to be sure.

Mr. BRYANT. Thank you.

Mr. ROE. Ladies and gentlemen, we will now have our distinguished colleague Congressman Feighan, who represents Ohio, to join with us first to make his presentation, and then we are going to take a lunch break. We will reconvene after we have Congressman Feighan's presentation and our questioning. We will recess and reconvene at 1:15.

The first order of business at that time will be the Orange County Sanitation District, Mr. Donald Holt, and his representatives that are here. So we would reconvene at 1:15 after we hear from our distinguished colleague who has been a very great leader, by the way, in the clean water efforts and in the environment of our Nation. We want to thank you for your support and cooperation.

Congressman Feighan, you may proceed.

TESTIMONY OF HON. EDWARD F. FEIGHAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO, AND HON. EARL MARTIN, MAYOR OF ROCKY RIVER, OHIO

Mr. FEIGHAN. Thank you, Mr. Chairman.

Mr. ROE. Would you identify the gentleman with you, who I understand is Mayor Martin.

Mr. FEIGHAN. Thank you very much, Chairman Roe and members of the subcommittee. Thank you for the opportunity to testify on the Rocky River Wastewater Treatment Plant, located in Rocky River, Ohio.

As the chairman has indicated, with me today is one of the distinguished mayors of the four communities served by this plant who share my desire to reach a resolution regarding this issue. I would like to formally introduce Mayor Earl Martin of Rocky River, Ohio, who is chairman of the Rocky River Wastewater Treatment Plant Management Board.

Our purpose in appearing before you is to explain the need for a $1.3 million grant to reimburse costs related to the construction of the Rocky River Wastewater Treatment Plant. This request is being made under the reimbursement provisions of the Federal Water Pollution Control Act.

The project at Rocky River, which also serves the communities of Bay Village, Westlake, and Fairview Park, was originally funded in 1968 under the research and development grant provisions of the Federal Water Pollution Control Act. The project was to use an advanced system of chemical coagulation and carbon filtration in order to provide the high level of treatment required for discharges into Lake Erie.

This form of experimental technology was urged on these communities by the U.S. Environmental Protection Agency. Construction on the plant was initiated in October 1972. Its operation has been a total failure.

As a former county commissioner in Cuyahoga County, Ohio, and now as a Member of Congress, I have vigorously pursued our request for reimbursement of the cost of this facility. The communities served by this project have been seeking reimbursement for many years. They, and I, have been frustrated because the Environmental Protection Agency (EPA) contends that the reimbursement provision should be used for "normal" projects, not innovative or demonstration projects.

EPA has refused to recognize the plant as eligible for additional reimbursement under section 206 (a) of the Clean Water Act. In a March, 1982 letter from John Hernandez, Deputy Administrator of EPA, to Mr. John Garner, Cuyahoga County Sanitary Engineer,

the objections of EPA were presented, and I quote from the EPA statement.

The present position that the Rocky River Plant is ineligible for reimbursement is based on two issues: the fact that construction of the project was initiated in October 1972 and the Agency's legal interpretation of Section 206 (a). That interpretation, based on the legislative history of the Clean Water Act of 1977 which amended Section 216 (a), is that a project on which construction was initiated between July 1, 1972, and 1973, must have received a grant under Section 8 of the Federal Water Pollution Control Act as amended by Public Law 84-660 in order to be considered eligible for reimbursement.

"Even if construction of the Rocky River project had been initiated prior to July 1, 1972, it could not have qualified for reimbursement because the legislative history of the Federal Water Pollution Control Act Amendments of 1972 indicates that the intent of Section 206 (a) was to reimburse those communities which had prefinanced a portion of the Federal share of the eligible cost of constructing waste treatment facilities in reliance upon Section 8 (c) of the Federal Water Pollution Control Act. Rocky River received its assistance under Section 6.

EPA adheres to this position in spite of the discussion that took place during the House debate on adoption of the conference report on House Resolution 4503, the Municipal Wastewater Treatment Construction Grant Amendments of 1981 (December 16, 1981). During that discussion my predecessor, former Congressman Mottl, raised the issue of eligibility. The chairman's response which was endorsed by Congressman Hammerschmidt, indicated that the Rocky River project was, in fact, the type of project contemplated by the Congress when it enacted the reimbursement provisions.

The core of the debate centers on EPA's contention that the law authorizing reimbursement does not apply to the funding requested for the Rocky River plant under the former section 6. There has been no suggestion that the project is, on its face, ineligible because of the language of the law. The debate centers entirely on congressional intent. It seems clear that the law, as it stands, does not preclude the Rocky River project from being eligible for reimbursement.

The U.S. Environmental Protection Agency has been insensitive to the concerns and needs of the residents of these four communities as they have attempted to resolve this issue through discussions and negotiations. Today, I am introducing legislation that will resolve the question of congressional intent. My bill merely restates congressional intent, declaring that the Rocky River wastewater treatment plant shall be eligible for reimbursement under section 206(a) of the Federal Water Pollution Control Act.

Once the question of eligibility is resolved, I will seek an appropriation of $1.3 million to reimburse these communities for the 50 percent Federal match as specified under section 6 of the Federal Water Pollution Control Act.

There is no question in my mind, nor in the minds of the residents of the affected municipalities, that this facility is eligible for reimbursement. This committee has already clarified its intent. I am now asking the Congress of the United States to reaffirm its original intention by supporting this legislation.

[H.R. 3956 follows:]

[H.R. 3956, 98th Cong., 1st sess.]

TO PROVIDE THAT THE ROCKY RIVER WASTEWATER TREATMENT PLANT IN ROCKY RIVER, OHIO, SHALL BE ELIGIBLE FOR REIMBURSEMENT UNDER SECTION 206(A) OF THE FEDERAL WATER POLLUTION CONTROL ACT

That notwithstanding any other provision of law, the Rocky River Wastewater Treatment Plant in Rocky River, Ohio, shall be eligible for reimbursement under section 206(a) of the Federal Water Pollution Control Act. For purposes of determining the amount of such reimbursement, amounts received under section 6 of the Federal Water Pollution Control Act (as in effect before the date of enactment of the Federal Water Pollution Control Act Amendments of 1972) shall be treated as having been received under section 8 of such Act (as in effect before such date).

Mr. FEIGHAN. With the support of this committee, and the Congress, I believe we can finally resolve this issue.

I would like, Mr. Chairman and members of the committee, to turn over a portion of my time and introduce again the mayor of the city of Rocky River who serves as the chairman of the board managing this facility and a gentleman who has been extremely familiar with the entire construction of the plant and the debate that took place with EPA for almost 10 years.

I would like to introduce Mayor Earl Martin, city of Rocky River.

Mr. ROE. Mayor Martin, the full text of your prepared statement will appear in the record at this point.

[Prepared statement referred to follows:]

ROCKY RIVER, OHIO,
OFFICE OF THE MAYOR,
September 19, 1983.

Mr. ROBERT ROE,
Chairman, Subcommittee on Water Resources.

DEAR CHAIRMAN ROE. The Cities of Rocky River, Bay Village, Fairview Park and Westlake, County of Cuyahoga, State of Ohio, entered into an agreement with the Commissioners of Cuyahoga County for the building and operation of a secondary wastewater treatment plant, located in the City of Rocky River.

This program originally began in 1967, when Cuyahoga County hired Shade and Shade Architects for the planning and design of an activated carbon pile secondary treatment system.

On August 17, 1970, Cuyahoga County awarded contracts to the Calgon Corporation for the building of said secondary treatment plant. This contract was subsequently voided by Court action.

On January 25, 1971, a letter written to Mr. John H. Puzenski, Sanitary Engineer of Cuyahoga County, from Arthur N. Masse, Chief, U.S. Environmental Protection Agency, Division of Municipal Treatment Research Program Advanced Waste Treatment Research Laboratory, indicated Mr. Masse's regret to the delay of the construction due to the legal difficulties and further expressed the U.S. E.P.A.'s belief that "the Plant, as determined by the plans and specifications was properly designed and would accomplish the intended objective—that is, produce an effluent of suitable quality for discharge into Lake Erie".

Armed with this information, Cuyahoga County set forth, and on January 27, 1972, awarded the contract for the construction of a secondary treatment plant. This contract was to the Spohn Corporation, and was also voided by Court action.

On September 18, 1972, the United States Environmental Protection Agency placed Cuyahoga County and the cities of Rocky River, Bay Village, Fairview Park and Westlake on 180 days notice, to proceed with the construction of the plant. A few days later, a meeting was held in the City of Fairview Park. Present at this meeting were representatives of the U.S. E.P.A., Cuyahoga County and the four cities. The meeting was held for the purpose of explaining the 180-day notice to proceed and to indicate to the four cities that additional funds for the construction of this project would be available upon the passage of Public Law 92-500. The funds would take the form of either reimbursement grants if the project had already begun, or construction grants if the law passed prior to the beginning of construction.

Section 206 of Public Law 92-500 made the project eligible for reimbursement construction grants and it was indicated by those representatives of the U.S. E.P.A. that the cities could receive an additional 55%, as long as we did not exceed 80% of the project cost.

With information from E.P.A. officer Arthur N. Masse, Chief, that we were building a superior plant and would accomplish its intended objective, and the further information from the U.S. E.P.A. representatives from Chicago that we would receive up to 80% of the total cost of construction, the cities of Rocky River, Bay Village, Fairview Park and Westlake, acting through its agent, Cuyahoga County, voted to move forward, and on October 2, 1972, the Spohn Corporation, being the lowest and best bidder was again awarded the construction contract.

On October 18, 1972, Public Law 92-500 was passed as amended.

In the spring of 1974, the new plant was completed and placed on line. Within weeks, the facility failed, and has never operated since that time, yet our cities will continue to pay for the E.P.A.'s mistake until the year 2000.

It would seem that under Public Law 92-500, we clearly are eligible for reimbursement grants, however the E.P.A. requirements define the word "construction" in the phrase initiation of construction and in their definition 35.890:

The phrase "initiation of construction" as used in this subpart, means the issuance to a construction contractor of a notice to proceed, or if not such notice is required, the execution of a construction contract.

Our problem now seems to be that we were too late for construction grants and too early for reimbursement grants. All wastewater treatment plants whose initiation of construction took place between July 1, 1972 and October 18, 1972 seem to be ineligible for either reimbursement or construction grants. I cannot believe that the Congress had intended this to be the situation. While some of our neighbors received grants up to 75%, we received a research grant for construction in the amount of less than 25% of the project cost.

At the present time, a second secondary treatment plant is under construction, for a total cost of thirty million dollars, of which our citizens will pay seven and one-half million dollars.

The citizens contributing to this Plant are unique in the United States, as they are forced to pay for something that they have never received.

Yours very truly,

EARL MARTIN, *Mayor.*

Mr. ROE. We are pleased to have you with us, Mayor Martin. You may go ahead.

Mr. EARL MARTIN. Thank you very much.

First of all, I do not agree with the Congressman from Ohio on the amount of money due us. I would like to go back to the year 1967 when this all started. I came into office as mayor in 1970, like you came to office here, Your Honor. So I have been around through this period of time and for 10 years we have tried to get our money back from the EPA who, in fact, cheated, lied and raped us. We are 80,000 people, and we are spending $10 million for a plant that does not function based on their recommendations and even their urgings to the extent they put us on 180-day notice and froze our permits.

Now, I would like to explain. This plant started out at about $1.3 million, and we had an R&D grant. It took so long to develop through our agents and the county that the price inflated to near $3.5 million by the time we went to bid.

We were put under 180-day notice to proceed. We were involved in several lawsuits. The EPA came down from Chicago and met with the Cuyahoga County officials and the officials of the four cities. They indicated to us what the 180-day notice meant and that we had to proceed with the project.

We said we didn't want to proceed because we understood that Public Law 92-500 was being amended and had been introduced on July 1 of 1972. This was in September of 1972, yes.

They said not to worry, "besides the R&D grant, you are eligible for 55 percent reimbursement grants, construction, so long as you can't get more than 80 percent." They told us that.

We had a letter dated January 25, 1971, to Mr. John Puzenski; Cuyahoga County sanitary engineer from Mr. Masse in Cincinnati with the EPA who indicated the plant we were building was superior and would function properly according to our plans and designs. So armed with that, EPA telling us we are building a superior plant and the fact we were going to get 80 percent money back, we were only risking 20 percent of the taxpayers' dollars on this R&D program.

[Letter referred to follows:]

ENVIRONMENTAL PROTECTION AGENCY
WATER QUALITY OFFICE
Ohio Basin Region
4676 Columbia Parkway
Cincinnati, Ohio 45226

January 25, 1971

Mr. John H. Puzenski
Sanitary Engineer of Cuyahoga County
1279 West Third St., Rm. 402
Cleveland, Ohio 44113

Dear Mr. Puzenski:

Thank you for your letter of January 12 and the copy of Dr. Loven's letter to you of January 6. I understand that the Journal Entry on the decision concerning Rocky River has now been made and that you are preparing to have the project re-bid.

The Federal Government's principal interest in the Rocky River project, and, indeed, the main reason that we are assisting in the cost of construction and operation, is to demonstrate what we believe to be a reasonable and, perhaps, superior (as compared to conventional biological treatment), method for treating municipal wastewaters.

By our approval of the plans and specifications, we expressed our belief that the plant, as determined by the plans and specifications, was properly designed and would accomplish the intended objective - that is, produce an effluent of suitable quality for discharge into Lake Erie. This is still our belief and we regret that it is necessary to delay construction because of the legal difficulties which arose.

For your consideration in having the specifications revised, I would like to make several comments on the points discussed by Dr. Loven in his January 6 letter, using the numbering system he used.

1. I believe that the equipment plans and specifications are sufficiently detailed that, with the supervision of your consultant, the plant can be constructed in a satisfactory manner. There should be no need to have the carbon supplier involved in this phase of the contract. In fact, I strongly

recommend that the supplying of the activated carbon itself be removed completely from this project and that bids for supply of the carbon be requested when the construction phase is nearing completion. It is only necessary that the carbon arrive in time to be loaded into the contactors. We have spent considerable money and manpower in our pilot plant activities in evaluating the adsorptive capacity, regenerability and physical stability of several granular activated carbons from various manufacturers. We are continuing with this research and will have more information at hand when the time comes to request bids for carbon. We believe it essential that only those carbons that have proved completely satisfactory in pilot plant use be considered for use at Rocky River.

2. I agree with Dr. Loven that the carbon supplier should be responsible for supervision of the filling of all eight adsorbers, backwashing of all eight adsorbers and the regeneration of only two adsorbers. If, as recommended in Item 1 of this letter, the purchase of the carbon is not a part of the construction contract, this subject will not be considered in the revised specifications. I believe that the operating manual should be prepared by the Engineer.

3. I have no comment to make on Item 12.5. This seems to me to be the province of the County Engineer and his legal advisors. I don't understand Dr. Loven's comments concerning the "particular process employed." I believe that the process to be employed is already pretty well defined by the plans and specifications.

4,5,6,7. If the purchase of carbon is not a part of this contract, Section 12.6 can be limited to those properties of the carbon that will influence design of equipment. These include bed density, particle density, uniformity coefficient, sieve size, mean particle diameter and moisture as packed. To avoid the problem brought up by Dr. Loven concerning "effective size" and "mean particle diameter," I suggest we leave out the "effective size" specification.

8. It seems evident to me from reading the seventh paragraph of Section 12.7 that "manufacturer" refers to the manufacturer of the underdrain blocks.

9. The carbon manufacturer, if the carbon is bid separately as recommended, will have no responsibilities in connection with construction of the plant.

10. The apparent densities of the spent and regenerated carbon need not be mentioned in the specifications.

11. This again seems to me to be in the province of the County Engineer and his legal advisors.

If you have any comments or suggestions on the above, please call me.

Sincerely yours,

A. N. Masse

Arthur N. Masse, Chief
Municipal Treatment Research Program
Advanced Waste Treatment Research
Laboratory

Mr. EARL MARTIN. The minute the thing was built, we found it never would run, never did function. It blocked immediately and the backwash would not work.

We were actually proving for the EPA that this plant would not function as a secondary treatment. We proved it, and they have never built another one as a secondary treatment. We withstood the entire cost of this operation, and we have never had any dollars back, not because we are not eligible for reimbursement, we are; but because when they put the regulations out, they changed the definition of the word "construction." Construction up to that time—according to the act right now, too—meant initiation of plans, anything, anything that had to do with the project.

When they put their regs out, it became initiation of construction and it meant the day you dug. We dug on October 2. On October 19, the bill was passed as amended. And everyone that was—everyone that dug between July 1 and October 19 didn't get anything. They were not eligible for reimbursement grants, and they were not eligible for grants.

So we got totally wiped out on this thing. I have been trying to explain this to people for 10 years, and you don't owe us $1.3 million, Your Honor, you owe us $2.8 million plus interest since 1973 because the people of my area are paying for a treatment plant, again right now, at $7.5 million. We are paying twice for a treatment plant in our area, and we have not received one yet, and we have not received the money due to us since 1973.

I don't feel like I am a foreign country, but I don't get any answers from these people. I don't know why we have been singled out. Our neighbors are getting 75 and 80 percent; we get nothing.

Mr. ROE. If the gentleman would yield, you have not been singled out from our committee point of view, because we have a number of others in the Nation in the same boat. We understand what you are talking about.

Let me ask you this. You talk of secondary treatment. Do you have a primary treatment plant now?

Mr. EARL MARTIN. Yes, sir, built in 1960, and we are presently constructing a conventional secondary plant for $30 million, of which our people are paying $7.5 million.

Mr. ROE. Let me develop this now. So we have primary treatment. Then EPA went into the innovative technology, which is the secondary treatment, which is the area of contention, did not work, you had to start over and build a so-called conventional plant which you are doing for secondary treatment now.

The question is the following: Under the plant under construction now, have you received support and grant allocations from EPA?

Mr. EARL MARTIN. Yes, very timely, very well.

Mr. ROE. So that part is coming along. In effect, you are coming back and saying above and beyond what we had to do because of failure of a R&D program that the burden for whatever, for whatever reason, attitude, has been placed on your community.

Mr. EARL MARTIN. Mr. Chairman, the plant in 1972 never functioned. We still want to pay our 20 percent.

Mr. ROE. The gentleman is not listening, maybe he is not understanding. I just want to set the case. Under the direction of EPA on the innovative technology, they said "Go ahead and build this innovative technological plant" concerning the secondary plant, which never worked.

Does EPA—obviously out of logic—if EPA is supporting your proportionate allowance for the new one, they had to recognize the old one didn't work.

Mr. EARL MARTIN. Correct.

Mr. ROE. Regardless of the dialog, it didn't work, so you are building a new one. That costs $30 million.

Now, how did you treat—how are you treating, from a financial point of view, this deficit we are dealing with on the original plant? Is that added to the sewer bill of the people? Is it a deferred deficit?

Mr. EARL MARTIN. It is a 25-year bond, $395,000 a year payment for the next 25 years.

Mr. ROE. Do you take that from general tax revenues?

Mr. EARL MARTIN. No, sewer funds.

Mr. ROE. So, therefore, they get an added surcharge for a plant that never worked and that is the nub of your contention?

Mr. EARL MARTIN. That is right.

Mr. ROE. Let me suggest the following. This is not an isolated case. We have three or four others we have gotten testimony on previously. I think it would be very helpful for us, our colleagues, if you could work to get this done, give us a chronological breakdown. In other words, your testimony is fine, but you are talking in the broad base. I would like to have a summary of the events that happened and any copies of corroborating data, letters you had received being urged by EPA to proceed, "We think this is a great idea," anything of that nature so we have that brief to establish your claim.

Mr. FEIGHAN. Mr. Chairman, we have those materials available and can put them in chronological order, and they would demonstrate that EPA in fact urged these communities to adopt this technology.

Mr. ROE. If it is agreeable to all members here, we would then allow the record to remain open to be submitted by yourself and Mayor Martin this documentation as part of the formal record. We would like to have that.

Dear Bob:

I want to thank you and the members of the Subcommittee on Water Resources for allowing me and Mayor Earl Martin of Rocky River, Ohio, to testify on the Rocky River Wastewater Treatment Plant issue. I appreciate your indulgence for monitoring the complexities of this matter over the years.

As you requested at the hearing, I am enclosing a project chronology of the Rocky River Wastewater Treatment Plant. If you have any questions or wish additional information please do not hesitate to let me know.

Sincerely,

Edward F. Feighan

Re: Rocky River Activated Carbon Process Reimbursement

Dear George:

We are happy to respond to your request for information pertaining to Cuyahoga County's unsuccessful efforts in obtaining additional USEPA grant assistance for the construction of the unsuccessful activated carbon sewage treatment process at the Rocky River Wastewater Treatment Plant.

This material includes the following:

1. A Project Chronology (11/8/67 – 10/18/82)
2. Letter dated 11/8/67 to Dept. of the Interior from John H. Puzenski, County Sanitary Engineer
3. Letter dated 7/22/68 from Joe G. Moore, Jr., Dept. of Interior
4. Instructions for Completing Applications for Research, Development and Demonstration Grants - Federal Water Pollution Control Administration dated March, 1969
5. Application for Research and Development Grant, Cuyahoga County Sewer District Improvement No. 615, Rocky River Wastewater Treatment Plant Detailed Discription of Project - Chemical Clarification and Carbon Filtration-Adsorption as Secondary Treatment - Revision of Project to Include Phosphate Removal
6. Rocky River WWTP R&D Grant No. 11010 DAB Letter to Sanitary Engineer from Willard F. Schade & Assocs., dated June 29, 1970
7. Offer and Acceptance of Federal Grant for Research and Development Under 33 U.S.C. 466 et seq, from Environmental Protection Agency Water Quality Office
8. Advanced Waste Treatment Seminar - Existing Rocky River Wastewater Treatment Plant, April 22 & 23, 1971

✓9. Letter dated 4/27/91, from Arthur N. Masse, Chief, Municipal Treatment Research Program Advanced Waste Treatment Research Laboratory

✓10. Letter from Sanitary Engineer to Board of County Commissioners - Revised Estimated Costs for Improvement 615(A) 8-6-71

✓11. Letter from Sanitary Engineer to Board of County Commissioners - dated 2/8/73, regarding Improvement 615-A / 8-6-71

✓12. Application for Reimbursement Grant - Federal Water Pollution Control Act Amendments of 1972 - Project No. 11010 DAB, dated 10/12/73.

✓13. Resolution Authorizing County Sanitary Engineer to make application for Reimbursement Grant as provided for in the Federal Water Pollution Act Amendments of 1972, for the Rocky River WWTP, in the amount of $1,432,520, dated 10/15/73

✓14. USEPA Grant Amendment dated 4/3/75

✓15. Environmental Protection Agency Program Requirements Memorandum 75-11, dated 4/17/74

✓16. Letter dated 5/25/76 to Stephen J. Sebesta, Sanitary Engineer, from Robert B. Schaffer, Associate Deputy Assistant Administrator for Air, Land & Water Use, USEPA

✓17. Commissioners Resolution dated 6/3/76, directing County Administrator and County Sanitary Engineer to file application with Federal EPA seeking reimbursement grant for construction costs of Rocky River WWTP as soon as H.B. 9560 or any similar legislation is enacted by Congress

✓18. Contract No. 1 - Request and Justification for Change

✓19. Letter dated 9/16/76 from Rocky River Mayor / EDGE MARTIN

✓20. Letter dated 9/25/81 from John J. Garner, San. Engr., to Ms. Charlie Smith, Ohio Coordinator, USEPA, re Rocky River WWTP Improvements 1970-1975.

✓21 Letter dated 11/13/81, from John J. Garner to Valdas V. Adamkus, Admr., USEPA, Region V, Chicago, Illinois

✓22. Letter dated 11/20/81, from John J. Garner to Ms. Charlie Smith, USEPA, Region V.

✓23. Letter dated 11/25/81, from Congressman Mottl to Val Adamkus, USEPA, Region V.

✓24. Letter dated 12/1/81, from John J. Garner to Richard Sullivan, Committee on Public Works & Transportation, Washington, D.C.

✓25. Letter dated 12/2/81 from Cong. Mottl to Richard Sullivan

✓26. Letter dated 12/14/81, from John J. Garner to Val Adamkus, Dir., USEPA Region V

✓27. Letter 12/10/81, from Congressman Mottl to James J. Howard, Chairman, Public Works & Transportation Committee

✓28. Letter dated 12/24/81, from John J. Garner to Congressman Mottl

✓29. Letter dated 2/2/82, from Congressman Mottl to John J. Garner, re testimony delivered before Appropriations Committee

✓30. Copy of Congressional Record dated 12/16/81

Cont'd.

31. Letter dated 2/3/82 from Lindy (Mrs. Hale) Boggs, M.C., to Congressman Mottl

32. Letter dated 2/3/82 from Bill Green, M.C., to Congressman Mottl

33. Letter dated 2/4/82 to Congressman Stokes from Commissioner Brown

34. Copy of Title 40-Protection of Environment

35. Letter dated 2/5/82 from John Garner to Congressman Mottl

36. Letter dated 3/15/82 from John Garner to Wm. Kitchell, Congressman Mottl's Office

37. Letter dated 3/26/82 to John Garner from John W. Hernandez, Jr., Deputy Admr., USEPA

38. Letter dated 10/18/82 to Richard Sullivan, Committee on Public Works & Transportation, from John Garner

We will be happy to discuss this voluminous material with you at your earliest convenience.

We appreciate the Congressman's and your interest in this matter. It continues to appear that if we are not successful in obtaining this additional federal grant reimbursement, the four (4) municipalities will continue to pursue their litigation against the County in this matter. Although I am confident that the County will prevail in the litigation, all of us can agree it is best to utilize our best efforts to prevent the litigation from proceeding.

Thanks again.

Very truly yours,

JOHN J. GARNER, P.E.
Sanitary Engineer

JJG:jmf

Enclosures

Rocky River Wastewater Treatment Plant Chronology
1910 - 1/9/78

1910 First sewage treatment plant built in Rocky River.

Nov. 16, 37 - Board of County Commissioners of Cuyahoga County entered into an agreement with the Cities of Rocky River, Fairview Park, and Bay Village for the construction, operation and maintenance of the so called Rocky River Wastewater Plant.

1938-39 - New plant constructed by the county with financial aid of Rocky River, Fairview Park and Bay Village. However, the Federal government made the largest contribution through the W.P.A.

Feb. 6, 50 - Rocky River city council requesting the County Commissioners to prepare plans for the improvement of expansion of the Rocky River plant.

Oct. 7, 57 - 16 mgd. Primary Treatment.

Oct. 7, 57 - Board of County Commissioners entered into a new agreement relating to the reconstruction, enlargement, maintenance and operation of the Rocky River sewage treatment plant and outfall sewer and provided for termination of the agreement of 11-16-37

Oct. 21, 57 - The Council of the City of Rocky River authorized the Mayor and Auditor to execute and deliver to the B.O.C.C. of Cuyahoga County an easement for an outfall sewer from the proposed enlarged sewage treatment plant to the waters of Lake Erie.

Mar. 27, 58 - Resolution approving a Supplemental Agreement by and against the City of Rocky River, the City of Fairview Park, the City of Bay Village and the Board of County Commissioners to provide for the testing of Legal Title to the sewage treatment plant and outfall sewer to be constructed.

Apr. 1, 58 - Yes to the County.

Apr. 1, 58 - Basic contract was supplemented in order to provide for the vesting of legal title to the sewage treatment plant and outfall sewer.

Jan. 2, 59 - Contract was supplemented for the second time to make provision for the assessment by the B.O.C.C. against benefited property in the City of Westlake of that portion of the cost of reconstructing and enlarging the sewage treatment plant originally assumed by Cuyahoga County pursuant to the Basic Contract to provide capacity for sewage from the City of Westlake.

Jan. 15, 59 - Board of Commissioners passing a resolution to provide for the preparation of Plans, Specifications and Estimates of costs for Reconstruction and Enlarging the Rocky River WWTP.

Jan. 15, 59 - The City of Westlake entered into an agreement with the B.O.C.C. of Cuyahoga County binding itself to the terms and conditions of the Basic Contract, the Supplemental Agreement and the Second Supplemental Agreement relating to the treatment of its waste at the Rocky River Wastewater Treatment Plant.

Jan. 29, 59 - Board Resolution approving agreement with Willard F. Schade for engineering services for the Rocky River WWTP.

June 1, 59 - Letter from Puzenski to mayors and Directors of the four communities sending them copies of preliminary plans, designs, specs and cost estimates.

June 2, 59 - To some properties.

Mar. 23, 60 - CCBC approved detailed Plans, Specs, Estimates of Cost and Tentative Assessments for the Construction of the Rocky River Plant Improvements.

Sept. 2, 60 - Public hearing for the plant's Improvements.

Sept. 29,60 - Baord resolution to proceed with the construction of the Rocky River Plant Improvement.

Dec. 15, 60 - Tabulation of proposal bids for the Rocky River Wastewater Treatment Plant. 5 Contracts. Enlargement and outfall sewer.

Dec. 15, 60 -	Contract I	Outfall	$342,340.00
	Contract II	Treatment Fac.	$2,836,009.05
	Contract III	Plumbing	$22,000.00
	Contract IV	Heating & Ventil.	$31,000.00
	Contract V	Electrical Works	$85,350.00

Jan. 9, 61 - Board Resolution authorizing the clerk to offer, at private sale $4,600,000 County Sewage Improvement No. 615 (Rocky River Plant) notes to serve the Rocky River sewer district.

Jan. 17, 61 - Board Resolution accepting offer of the Society National Bank of Cleveland, to purchase $4,600,000 County Sewage Improvement No. 615 notes.

Mar. 17, 61 - Ground Breaking ceremonies for the plant.

Jul. 24, 62 - Ordinance passed by the Rocky River city council which regulates the type and flow of sewage into the recently completed enlarged Rocky River Plant.

Apr. 20, 63 - Letter from Joseph M. Poe Rocky River Mayor to Puzenski requesting the content of the Dec. 4, 1962 letter stating the nauseating smell of the new Rocky River Plant.

Apr. 20, 63 - Reply from Puzenski to the mayors of the four communities informing them that the sludge drying and sludge incinerative equipment will be in operation soon. Subsequent letters show that odor problem persisted at least throughtout the 1973 year.

Oct. 65 - Letter from the Ohio Water Pollution Control Board ordering the County to submit a report and general plan for compliance with the conclusion and recommendations of the Lake Erie Conference concerning the means to maximize the reduction of biochemical oxygen demand, phosphates and coliform concentrations.

Aug. 18, 66 - B.O.C.C. resolution approving agreement between the Board and Schade, Willard F. Schade & Assoc. for engineering services for the reconstruction and enlargement of the Rocky River Sewage Treatment Plant.

Aug. 18, 66 - Not to my knowledge. No record found.

Jan. 19, 67 - Dept. of Health of the State of Ohio approved general plans.

Jan. 31, 67 - Plans were sent to mayors of the four communities for review and approval.

Feb. 27, 67 - Four mayors objected to the new construction for the secondary treatment facility to be easterly of the existing plant. Schade & Associates were therefore instructed to prepare new general plans for an alternative site for the location of the treatment facility.

Feb. 27, 67 - Plans I & II would encroach on private property. Land would have to be bought etc. Plan II would eliminate doing that.

Mar. 29, 67 - Schade & Assoc. completed general plans for the alternate sites and copies were sent to the four mayors.

May 10, 67 - A request was made by the mayors to the Schade & Assoc. to prepare alternative site general plans, cost $17,844.51.

June 28, 67 - John H. Puzenski letter to the four mayors submitting plans for the revised site plan for the required secondary treatment to the Rocky River Wastewater Treatment Plant.

June 28, 67 - Not to my knowledge. No record found.

June 28, 67 - Letters from Puzenski to the four mayors sending them copies of revised site plan for the repaired secondary treatment to the existing Rocky River WWTP.

Dec. 27, 67 - Letter from George H. Eagle - State of Ohio Dept. of Health to the U.S. Dept. of the Interior, Federal Water Pollution Control Administration. Content of letter: Cuyahoga County Sanitary Engineer applying for a Research and Development Grant for the purpose of installing secondary wastewater treatment facilitites Because of available space, convectional secondary treatment construction not possible, therefore the process of chemical clarification and grainular activated carbon filtration and absorption considered.

Feb. 9, 68 - Robert E. Schade and Rizzo (Calgon Corp.) papers on Secondary Treatment with Granulated activated Carbon. These papers list references of works done on carbon treatment of sewage wastes.

Jul. 22, 68 - Letter from Joe G. Moore Jr. from the Federal Water Pollution Control Administration to Puzenski informing him of the $741,350 Research and Development Grant offer.

Jul. 31, 68 - Letters from John H. Puzenski to mayors of the four communities informing them of the $741,350.00 grant from the Federal Water Pollution Control Administration.

Jul. 31, 68 - Yes, Mayors were informed of R&D Ramifications.

Aug. 14, 68 - Board resolution to accept a Federal Grant of $741,350.00 for research and development in connection with the Rocky River Wastewater Treatment Plant.

Dec. 5, 68 - Board of Commissioners resolution approving a supplement agreement with Willard F. Schade and Associates for modification of contract for engineering services for the Rocky River sewage treatment plant. $17,844.51 increase.

Mar. 24, 69 - Rules and Regulations for R&D and demonstrations Grants.

Jun. 27, 69 - Letter sent from Puzenski to Frank A. Kobbes, Westlake City Engineer, Plant basis of design for Secondary Treatment.

Jun. 30, 69 - Department of Health of the State of Ohio approved the detailed set of new plans.

Jul. 21, 69 - The City of Westlake bound itself to all of the terms and conditions of the Basic Contract, the Supplement Agreement, the Second Supplement Agreement and the Third Supplemental Agreement, thereby obtaining the right to connect its sanitary sewerage system for discharge into sewers which are connected with or tributary to the Rocky River sewage treatment plant and outfall sewer.

Jul. 21, 69 - Board resolution to enter into a third Supplemental Agreement with the four communities, the purpose being to facilitate the City of Westlake financing of a sanitary sewage collection system throught the issuance of mortgage revenue bonds.

Sept. 22, 69- Letter from A.N. Masse, Acting Chief Municipal Treatment Research Program Advanced Waste Treatment Research laboratory informing John H. Puzenski, Cuyahoga County Sanitary Engineer that the Federal Government would not guarantee carbon column lining unless rubber would be used as lining.

Nov. 11, 69 - A. N. Masse letter to Puzenski about the source of the problem encountered at the Ponona Wastewater Treatment Plant.

Jan. 22, 70 - Letter from Arthur N. Masse to Paul Beck informing him of the possibility of sulfide production in the carbon columns. In their letter Joe Rizzo of Calgon suggests that their problem may be avoided by utilizing air diffusers in the clairfier and having a high dissolved oxygen going to the carbon.

Jan. 29, 70 - Board resolution to proceed with the construction of the plant.

Feb. 26, 70 - Public Hearing on objectives in connection with improvement of the Rocky River Wastewater Plant.

Feb. 26, 70 - Yes, R&D funds were mentioned. No negative response from communities with regard to construction. Mayors Martin, Roman, and Mooney were present. They favored the project. Mr. Saddler City Engineer for Bay Village, present, also favored the project.

Apr. 6, 70 - Board second resolution to proceed with the construction of the plant.

Apr. 6, 70 - Board adopted a resolution determining to proceed with the construction of the improvement of the Rocky River wastewater treatment plant.

May 21, 70 - Board resolution directing the Clerk to advertise for bids for the construction of the plant.

Jun. 11, 70 - Tabulation of proposal bids for the Rocky River wastewater plant, 4 contractors.

Jun. 11, 70 - Proposal bids for the construction of the Rocky River plants received. Action deferred on account that the carbon specs may have favored Calgon.

Jul. 13, 70 - Letter from A. N. Masse USEPA authorizing Puzenski to proceed with the awards of contracts for all four projects.

Jul. 27, 70 - City of Fairview Park passed an Ordinance to enter into an agreement with the Board of County Commissioners relative to the construction and operation of the so called Rocky River Treatment Plant.

Aug. 3, 70 - The City of Bay Village passed.....

Aug. 10, 70 - The City of Rocky River passed.....

Aug. 13, 70 - The City of Westlake passed....

Aug. 17, 70 - Board of County Commissioners resolution to enter into an agreement with the Cities of Bay Village, Fairview Park, Westlake and Rocky River relative to the construction and operation of the so called Rocky River Sewage Treatment Plant.

Aug. 17, 70 - County of Cuyahoga awareded contracts to the Calgon Corp. for the building of the Rocky River wastewater treatment plant. All contract later voided by Court action. Court, in the Frank C. Gasper es. rel. U.S. Board of County Commissioners ruled all the contracts void because specs favored Calgon.

Aug. 17, 70 - Board resolution authorizing the Execution of an Agreement with the cities of Bay Village, Fairview Park, Rocky River and Westlake Relative to the construction and Operation of Sewage Treatment Facility at Rocky River.

Aug. 17, 70- Board resolution to award the Contract I to Calgon Corp. $2,702,108.87, Contract II to Garison Levelle Plumbing Co. $35,500.00, Contract III to Reliance Mechanical Const. Inc. $6,944.00, Contract IV to Hubert Electric Co. $145,697.00.

Nov. 25, 70- Common Please Court Case No. 886.544, (State of Ohio, ex rel. Frank C. Gasper US Board of County Commissioners of Cuyahoga County, et al). Judge Perry B. Jackson concluded that carbon specs did favor Calgon.

Mar., 71 - Legal notice, Information to Bidders etc., (second proposal) 5 contracts.

Mar. 3, 71 - Letter from EPA advising Puzenski that application dated August 5, 1970 for supplemental funding of the construction grant has been approved in the amount of $250,000 or 38.52% of the revised total eligible costs of $2,573,810, whichever is less.

Mar. 3, 71 - USEPA by letter offered the County a development and research grant subject to terms and conditions.

Apr. 9, 71 - Letter from George H. Eagle to CCBC notifying them that specs and places for the proposed Rocky River WWTP have been approved.

Apr. 22-23,71-Advanced waste Treatment Seminar Cleveland Engineering Center. Explains in details why the carbon column treatment process was chosen.

Apr. 27, 71- Letter from Puzenski to George H. Eagle, Chief Engineer, Ohio Dept. of Health, acknowledging receipt of Eagle's letter approving revised detailed Plans of Proposed Secondary WWTP for the Rocky River service areas.

May 20, 71 - Letter from Mayor Martin to Puzenski informing him of numerous complaints about the offensive odor emitted by the sewage plant.

May 26, 71 - Letter from William Schade to Puzenski asking for specs revision so that rebidding can reoccur. Their is a result of the Frank C. Gasper - US - CCBOC law suit.

Aug. 2, 71 - Rescinding the resolution adopted April 6, 1970 to proceed with the construction of the secondary sewage treatment facilities at the County's sewage treatment plant in the City of Rocky River.

Aug. 6, 71 - Revised estimated costs $4,879,630.00 - Specs change.

Aug. 9, 71 - Board of Commissioners approved revised detailed plans, specifications and estimates of cost for the improvement of the Rocky River Wastewater Treatment Plant

Aug. 9, 71 - Board resolution approving detailed plans, specs and estimates for the plant construction.

Sep. 9, 71 - Board resolution informing the mayors, city engineers, councilmen and consulting engineer of the result of the Public Hearing. After discussion, the Board informed all present that objections of the proposed improvment be made in writing within five days after this hearing.

Sep. 9, 71 - Board Resolution authorizing public hearing for the plant construction works.

Sep. 16,71 - Board request to the Cuyahoga County Sanitary Engineer to proceed with the advertisement for bids for the construction of such improvement.

Sep. 16, 71- Board resolution ratifying revised plans, specs, character and terminal for the conty sewer (WWTP) improvement.

Oct. 7, 71 - Letters from J.H. Puzenski to mayors sending their Volume One (Legal Notice, Information to Bidders, Proposals and Contract) and Volume Two (General Conditions and Detailed Specifications) of specifications for Cuyahoga County Sewage Improvement No. 615A, Rocky River Wasterwater Treatment Plant.

Oct. 18, 72 -Law was amended to provide additional funds for planning and construction grants to communities, sewer districts etc.

Oct. 26, 72 -Letter from Puzenski to the four mayors sending them copies of letters from Water Pollution Control Federation offering the county $741,350 grant (July 22, 68) and the supplement grant of $250,000 (March 3, 71).

Oct. 26, 72- $250,00 required to offset a portion of the additional cost for construction modifications and to provide additional operation and maintanence funds during the course of the project.

Oct. 26, 72- Letters from John H. Puzenski to mayors informing them of the supplement grant of $250,000.00 from the United States Government for the Rocky River Treatment Plant.

Oct. 31, 72- Informal Hearing on alleged violation of the Ohio Water Quality Standards Supplementation Plan for Lake Erie by the County of Cuyahoga, Ohio at sewer District #6 (Rocky River) Treatment Plant

Nov., 72 - Break ground for the construction.

Jan. 31, 73- U.S.E.P.A. recommended by letter certain major change in the plans and specifications necessary to meet the recently adopted State of Ohio Air Quality Standards.

Feb. 12, 73- Board resolution to provide for the redesign of the carbon adsorption system for the Rocky River wastewater plant in order to increase the operating pressure from 30 psi to 50 psi as recommended by the USEPA. Estimated cost $250,000.00

Feb. 12, 73- Yes.

Feb. 16, 73- Letter from Mayor Martin to Puzenski advising him to file an application construction grants.

Feb. 16, 73- Letter from Puzenski to Ned E. Williams USEPA requesting Williams to forward the forms necessary for the County of Cuyahoga to make applications for a construction grant for the Rocky River WWTP.

Feb. 27, 73- Letter from Mayor Martin to Puzenski advising him to the fact that working in the application for reimbursement be changed from "research grant" to "construction grant".

Feb. 28, 73- Letter from Mayor Martin to Puzenski summerizing the Provisions of the Federal Water Pollution Control Act of 1972. Public Law 92-500 in relation to funds reimbursement.

Mar. 20, 73- Letter from John L. Dowling, Assistant Prosecuting Attorney to William S. Gaskil County Administrator concerning the responsibility of the residential engineer.

May 10, 73 - Board resolution approving County Sanitary Engineer request for authority to prepare the necessary change orders to design and install a Two-Stage Scrubber for the Regeneration Furnace at the Rocky River Wastewater Treatment Plant. Estimate costs is about $50,000.00 plus engineering costs.

May 24, 73 - The B.O.C.C. approved the funding of $19,500.00 to be paid to Schade & Assoc. for engineering services (Supplemental Agreement No. II) (Actual cost $24,414.38).

Jun. 30, 73- Letter from Frank C. Dunbar Jr. to A.M. Braun, Assistant Prosecuting Attorney explaining why Calgon bid should be rejected.

Jul. 5, 73 - Letter to Puzenski from Mayor Martin of Rocky River informing him that they (presumably the four mayors) are working on the question whether the Rocky River WWTP in eligible for a reimbursement grant under Public Law 92-500.

Aug. 8, 73 - Letter from William H. Moss to Schade & Associates staff with copies sent to the Sanitary Engineers' staff and to Irwin Kugelman (EPA) request that a letter backdated July 30, 73 be sent to Federal EPA requesting a extension of time, because of litigations which occurred during the bidding process. Federal Grant expiration date was July 31, 1973.

Oct. 9, 73 - Letter from Carboline representative indicating that coal tear based epoxy materials failed in lab work performed at the Taft Center, they recommend flake glass polyester linings and elastormeric linings for the carbon columns.

Oct. 10, 73- Robert E. Schade to John H. Puzenski recommending that Calgon Corp be hired for a duration of approximately fifty man days to include carbon supplier consultant service following start-up and during the first year operation.

Oct. 12, 73- Application from Puzenski to the Federal Water Pollution Board requesting Reimbursement Grant (Letter shows how the figure $1,432,520 was derived).

Oct. 15, 73 -Board resolution instructing and authorizing John H. Puzenski, to make application for reimbursement Grant as provided for in the Federal Water Pollution Act Amendments of 1972, for the Rocky River Wastewater Plant, in the amount of $1,432,520.00.

Oct. 15, 73- Total project cost approximately $ 4,879,630.00
% of 4,879,630.00 = 2,439,815.00
Total Grant prev. received = 991,350.00
Approximately = $ 1,448,465.00
This figure is close to mayor Martin's $1,432,520.00

Oct. 15, 73- House Bill No. 9650.

Oct. 25-26,73-Letters from William S. Gaskill to Mayors Roman, Martin, Reese and Mooney indicating that the board filed application with the Federal EPA requesting reimbursement of the costs of improvements to the Rocky River WWTP.

Jan. 17, 74 -Resolution authorizing Puzenski to sign in behalf of the Board of County Commissioners of Cuyahoga County the form entitled "Grant Amendment" extending the period of Grant no. 11010 DAB-01-2 (R D grant) from 8-16-68 to 7-13-73 to 8-16-68 to 6-30-76.

Jan. 28, 74 -EPA approval of grant extension from 8-16-68 - 7-31-73 to 8-16-68 - 6-30-76.

Feb. 28, 74 -The Board of County Commissioners approved a resolution for modification of contract for engineering services $3,250.00 (Supplemental Agreement III) Schade est. $7,469.00.

Feb. 28, 74- The B.O.C.C. approved a resolution for construction and post construction periods for engineering services required for the sewage treatment plant. $30,000.00 increase (Supplementary Agreement IV, actual cost $53,605.33).

Dec. 23, 74 -Resolution from the Rocky River city council authorizing Mayor Martin to enter into an agreement with the BOCC, Bay Village, Fairview Park and Westlake, to file an application for a federal grant to assist in the cost of studying and evaluating the I&I into the sewer system of the four communities.

Dec. 23, 74 -Rocky River passed a resolution for I&I works in Westlake.

Jan. 16, 75 -Letter from Bill Moss (William F. Schade & Assoc.) to William Gaskill (County Administrator) explaining the cost allocations for the $991,350 R&D monies from the Federal EPA.

Apr. 7, 75 - Bay Village passed a resolution for I&I works in Westlake.

Apr. 17, 75 -Westlake passed a resolution for I&I works in Westlake.

Jun. 2, 75 - Fairview Park passed a resolution for I&I works in Fairview Park.

Oct. 1, 75 - Plant was started on a full time basis.

Nov. 10, 75 -Resolution by Commissioner approving an agreement between Michael Benza & Associates and Cuyahoga County Sanitary Engineers for the preparation of a Step I application for the Rocky River S.D. (Bay Village, Fairview Park, Westlake and Rocky River).

Nov. 10, 75 -Agreement made among the cities of Bay Village, Fairview Park Westlake and Rocky River and the Board of Commissioners of Cuyahoga County for the preparation of the Step I application for the Rocky River sewer district.

Nov. 10, 75 -CCBC passed a resolution authorizing I&I works for the Rocky River sewer district.

Dec. 19, 75 -Plant dedication.

Jan., 1976 - Plan of Study for the Rocky River Planning area prepated by Michael Benza & Associates. Plan of Study revised by Sanitary Engineering office and sent to EPA within a couple of months.

Mar. 15, 76 -Board resolution authorizing Steve Sebesta to sign a Federal Step I Grant Application for the preparation of a Facilities Plan for the Rocky River Wastewater Treatment Plant.

May 6, 76 - Application for Step I funds completed.

May 13, 76 - Resolution of agreement between board of Commissioners and Michael Benza for the preparation of a facility plan for the Rocky River sewer district.

May 25, 76 - Letter from Robert B. Schaffer USEPA advising Steve Sebeste that no more funds are committed from research and development funds. Schaffer says that it is not possible to obtain additional funds through the Construction Grants Program to contribute to the cost of facilities already in place.

Jun. 3, 76 - Board resolution directing the Sanitary Engineer to file an application with the EPA seeking a reimbursement grant for construction costs of the Rocky River Wastewater Plant.

July, 1976 - One carbon column rubber lining failed.

Jul. 19, 76- Agreement between the Board of Commissioners and Metcalf & Eddy Engineers for engineering services in the preparation of reports, consultation and advice, review mayor mechanical systems, and provide contract administration assistance for the Rocky River Wastewater Treatment Facility. $25,000.00.

Jul. 23, 76- Step II application for the Rocky River planning area.

Jan. 18, 77-Board resolution of Supplemental Agreement No. 1 with Metcalf & Eddy Engineers for further work in the assistance and reassistance of the Rocky River Wastewater Plant. Additional funds not to exceed $20,000.00.

Apr. 4. 77 -Board resolution approving Supplement Agreement No. 1 to the contract No. 17369 with Michael Benza & Associates, Inc., calling for modification of contract for engineering services in connection with the preparation of the Rocky River sewer district facilities plan.

Apr. 15, 77-Letter from Metcalf & Eddy Inc. to Steve Sebesta, suggesting absolving the contractor with complete responsibility of the Rocky River Plant failure and relieve the contractor of any responsibility for the failure.

Oct. 21, 77-Payment to Metcalf & Eddy Engineers $21,275.12.

Oct. 31, 77-Resolution authorizing the Sanitary Engineer of Cuyahoga Co. to sign in behalf of BOCC the form entitled "Grant Amendment" extending the period of Grant No. 11010 DAB-7 from 8-16-68 to 12-31-76 to 8-16-68 to 1-31-78.

Jan. 9, 78 -Board resolution to pay $145,000.00 to Spohn Corporation to terminate all the litigation over the construction of the Rocky River Wastewater Plant.

COUNTY OF CUYAHOGA
SANITARY ENGINEERING DEPARTMENT

JOHN H. PUZENSKI
OUNTY SANITARY ENGINEER

November 8, 1967

U. S. Department of the Interior
Federal Water Pollution Control Administration
633 Indiana Avenue, N. W.
Washington, D. C. 20242

Re: Cuyahoga County Sewer
District Improvement No. 613
Rocky River Waste Water
Treatment Plant

Gentlemen:

Enclosed herewith for your review and approval is the form entitled "Application for Research and Development Grant" for grants under Title II, Section 6(a) of the Federal Water Pollution Control Act as amended by the Clean Water Restoration Act of 1966, in the amount of $1,370,000, in connection with the Waste Water Treatment Plant in the City of Rocky River, Ohio, also known as County Sewer District Improvement No. 613.

A copy of this application is also being sent to the Ohio State Department of Health, Water Pollution Control Board.

Very truly yours,

John H. Puzenski
Sanitary Engineer of
Cuyahoga County, Ohio

JHP:bma
Enclosures

CC: E. B. Ransom
Ohio State Department of Health

(3)

JUL 22 1968

Dear Mr. Puzenski:

We are pleased to offer you a Research and Development Grant for the project "Chemical Clarification and Carbon Filtration and Adsorption as Secondary Treatment for Rocky River Wastewater Treatment Plant, Cuyahoga County, Ohio, Sewer District Improvement No. 015," as described in your application dated November 1, 1967, and which is to include "Revision to Include Phosphate Removal."

The grant offer is $741,350 or 50% of the eligible project costs, whichever is less, subject to the conditions and assurances set forth in the enclosed Section I of the Offer and Acceptance document (and attachments).

Acceptance of this Offer must be made by completing Section II of the Offer and Acceptance document and returning one copy of both Sections I and II (and attachments) within the next thirty (30) days.

We are hopeful that this project will contribute significantly to the advancement of the Administration's and your County's water pollution control programs. The importance of this and similar projects in serving as useful demonstrations having wide application cannot be overemphasized.

Should you have questions concerning this grant offer, please contact us.

Sincerely yours,

Joe G. Moore, Jr.
Commissioner

Mr. John H. Puzenski
Sanitary Engineer of Cuyahoga County
1219 Ontario Street
Cleveland, Ohio 44113

INSTRUCTIONS FOR COMPLETING APPLICATIONS FOR RESEARCH, DEVELOPMENT, AND DEMONSTRATION GRANTS

Office of Research and Development
FEDERAL WATER POLLUTION CONTROL ADMINISTRATION

March, 1966

INSTRUCTIONS FOR COMPLETING APPLICATIONS

RESEARCH, DEVELOPMENT, AND DEMONSTRATION GRANTS

General Information

Review the following information contained in the Research, Development, and Demonstration Grant application kit before preparing an application:

a. Rules and Regulations for Research, Development, and Demonstration Grants.
b. Patents and Inventions Article.
c. Clean Water Fact Sheets.

Submission of Application 8

Submit an original and 7 copies of each application and one acknowledgement card to:

Project Coordination
Office of Research and Development
Federal Water Pollution Control Administration
U. S. Department of the Interior
Washington, D. C. 20240

Acknowledgement by FWPCA

The applicant shall complete the acknowledgement card and attach the card to the original grant application. The card showing the date of receipt will be returned to the applicant.

PART I, SECTION A, REQUEST AND CERTIFICATION

1. Type of Grant

Class I. Those projects intended to establish, discover, develop, elucidate, or confirm information on the causes, control, and prevention of water pollution.

Class II. Those projects intended to demonstrate the applicability and utility of research findings on the causes, control, and prevention of water pollution.

Class III. Those projects which will assist in the development of, and/or will demonstrate, a new or improved method of controlling the discharge into any waters of untreated or inadequately treated sewage or other wastes from sewers which carry storm water or both storm water and sewage or other wastes.

Class IV. Those projects which will assist in the development of and/or will demonstrate advanced waste treatment and water purification methods (including the temporary use of new or improved chemical additives which provide substantial or immediate improvement to existing treatment processes) or new or improved methods of joint treatment systems for municipal and industrial wastes.

Class V. Those projects intended to prevent pollution of waters by industry, including, but not limited to, treatment of industrial wastes.

2, 3, and 4. Self-explanatory.

5. Grant Director

The Grant Director is the person who has been assigned responsibility for overall direction and management of the project for the applying organization. He must be an officer or employee of the applying organization.

6. Project Director

The Project Director is the person who has been assigned responsibility for the technical supervision of the project. The Project Director and Grant Director responsibilities may be assigned to one person if desired.

7. Self-explanatory.

8. Type of Application

New - A project not previously supported by an FWPCA grant.
Revision - An existing grant project requiring additional funds or other changes for completion within the grant period.
Continuation* - An existing grant project requiring additional time and funds or other changes for completion.

Where the application is for a revision or a continuation, insert the original FWPCA Grant Number.

9. Project Financing

a. For Total Project:
Total Project Period - estimated beginning and ending dates for entire project.

---

* Grants for Class I and Class II projects are normally made for a maximum grant period of 12 months. Continuation grants for additional grant periods of up to 12-months each are subject to avail[illegible] appropriated funds [illegible] successful development of the [illegible] Class III, IV, and V [illegible]

9. Project Financing (Continued)

a. For Total Project: (Continued)

Total Project Cost - estimated total cost for entire project.

b. For This Request*:

Grant Period - estimated beginning and ending dates of activity to be financed by requested grant.
Applicant's share - project costs to be paid by applicant during grant period.
Grant Requested - self explanatory.
Total - applicant's share plus grant requested.

10. Terms and Conditions

The signature must be in ink. If applicant is a governmental body, a copy of the official council, board, or other action authorizing the signer of the application to apply for a grant must accompany the application.

PART I, SECTION B, SUMMARY DESCRIPTION OF PROJECT

Self-explanatory

PART I, SECTION C, APPROVAL BY STATE WATER POLLUTION CONTROL AGENCY

Not required

The Act requires that Class III (Storm and Combined Sewer) and Class IV (Advanced Waste Treatment) grant applications be approved by the appropriate State water pollution control agency. Prior to submission to FWPCA, submit the completed application to the water pollution control agency of the State (s) in which the project will be conducted as identified in Part I, Section A-4.

ATTACH LETTER OF APPROVAL

PART I, SECTION D-1, FINANCIAL SUMMARY

1. Estimated Project Costs During Grant Period

A. thru J. - The amounts shown for each Budget Category are to be taken from Part I, Section D-2, FINANCIAL DETAIL. The first column should indicate the total funds required for each budget category during the

---

* Grants for Class I and Class II projects are normally made for a maximum grant period of 12 months. Continuation grants for additional grant periods of up to 12-months each are subject to availability of appropriated funds and successful development of the project. Grants for Class III, IV, and V rojects are normally made for the total project period.

grant period. The second column should indicate the grant funds being requested for each item. Show the totals of items A. thru I. in the appropriate space.

J. Indirect Costs - Indirect costs, as described in Bureau of the Budget Circular No. A-21 (Revised), are those costs which, because of their nature, are normally not identified with specific or individual projects. A grantee's general and administrative costs such as personnel management, accounting, purchasing, and normal maintenance and protection of the grantee's facilities are examples of indirect costs and shall not be charged as direct costs unless, because of special circumstances, an exception is specifically approved by the FWPCA in advance.

Indirect cost rates are established in one of the following ways: (1) by a previous Government agency audit, (2) by the applicant's own cost accounting practices, or (3) by special computation for the grant project. The latter two methods will require approval based upon Government audit, but a provisional rate may be used until an audit is performed. In these cases, provide a detailed computation on a separate sheet to show how the proposed provisional rate is determined. In no instance may indirect cost rates be applied to contract expenditures for consultant, equipment, other contracts, or construction. Enter cost in the appropriate space.

K. thru S. (if applicable) - The amounts shown for each Budget Category are to be taken from Part I, Section D-2, FINANCIAL DETAIL. The first column should indicate the total funds required for each budget category during the grant period. The second column should indicate the grant funds being requested for each item. Show the totals of items K. thru S. in the appropriate space and the total project costs (A. thru S.) where indicated.

2. Proposed Funding

A. Applicant's Share - Cost sharing is required for all grant projects. The minimum share of the total project cost to be borne by the applicant is:

Classes I & II	5 percent of total project costs
Classes III & IV	25 percent of total project costs
Class V	40 percent of total project costs

One factor which will be considered in the evaluation of a proposed project is the share of project costs which the Applicant proposes to bear above the minimum share required.

Note: The statutory limitation for Federal support on a Class V grant is $1,000,000.

B. Self-explanatory

C. Total - The sum shall be equal to the total R/D/D Studies (A. thru J.) or total Project Costs (A. thru S.)

3. Support to be Used for the Project

Identify the support by source and date available. If an election is required for issue of bonds or levy of taxes, etc., state results and date if held, or plans and proposed date if not yet held.

PART I, SECTION D-2, FINANCIAL DETAIL - RESEARCH/DEVELOPMENT, DEMONSTRATION STUDIES

The estimate of funds required shall be as accurate as circumstances permit. Where the project is incorporated with and only a portion of a larger project, such as a public works project, only the costs relating to the smaller project shall be listed. Where requested information is not applicable, insert N.A. in the space provided.

A. Salaries and Wages - Name principal personnel to be engaged on the project and other personnel (by number of employees). Where applicable provisions of Bureau of the Budget Circular A-21 (Revised), Section [illegible], Stipulated Salary Support, shall be included relating to professional staff support.

B. Fringe Benefits - Name principal personnel and number of other personnel to be engaged on the project; and opposite each, list the types, basis of computation, and amount of fringe benefit costs for this project. This section is to be utilized only if the applicant's established policies treat fringe benefits as direct costs.

C. Self-explanatory.

D. Equipment - Cost of equipment to be used on the project shall be detailed here. Indicate whether the equipment will be purchased, rented, or furnished by the applicant. If furnished by the applicant, give details on computation of use allowance requested on separate sheets. Documented justification for purchase of equipment must be available for audit purposes.

E. thru G. Self-explanatory.

H. Other - Identify the nature, purpose, and estimated costs of all items not identified in other categories.

I. thru J. Self-explanatory.

PART I, SECTION D-2, FINANCIAL DETAIL - FACILITIES

K. Construction - Engineering Plans - Provide an estimate of the cost of preparation of plans and specifications.

L. Construction - Supervision - Provide an estimate of the cost of supervision of construction.

M. Construction - Contracts - List anticipated and known contracts (including site construction and identifying numbers) for construction, alterations and renovations and describe the purpose and estimated costs for each.

If construction is to be phased or otherwise divided, list funds required for the later contracts and describe the purpose and estimated cost of each. Provide a total of estimated costs for this category.

N. Construction - Materials - Cost of materials and equipment to be used in the construction portion of the project and to be furnished by the applicant shall be detailed here. Indicate whether the equipment will be purchased, rented, or furnished by the applicant. If furnished by the applicant, give details on computation of use allowance requested on separate sheet. If construction work, or a portion thereof, will be performed by the applicant's personnel, include "Force Account" in this category and give details (number of persons, time or effort, payroll costs). Provide a total of estimated costs for this category. Documented justification for purchase of equipment related to this project must be available for audit purposes.

O. thru S. Self-explanatory. These items refer to the technical services and operation and maintenance activities associated with the construction facilities phase of the project.

PART I, SECTION E, PROJECT SCHEDULE

1. Data on Contracts

If any contracts have been let which will involve project funds, so indicate. This includes construction, engineering services, etc.; the listing should include the purposes of the contract, name of contractor, and date of contract. A copy of any contract(s) already let should be submitted with the application.

2. Schedule

Self-explanatory. Not applicable to Class I Grants. In the case of Class I Grants, project phasing should be included in the Project Plan, PART II, SECTION A, item 3., Plan of Operation.

PART II, DETAILED PROJECT DESCRIPTION

PART II of the application shall provide a detailed description of the project plan, supporting information and miscellaneous information. The description shall be prepared in accordance with the following outline to assist in the review of the application.

PART II, SECTION A, PROJECT PLAN

1. Project Objectives

2. Need for Project

   Explain how the anticipated results of the proposed project should contribute information and technology relating to the causes, control, or prevention of water pollution and why the results will be of importance.

3. Plan of Operation

   Show how the plan will fulfill each of the project objectives. As much detail as possible should be included relating to: background information (e.g., waste stream characteristics, receiving water characteristics, waste stream sources, etc.); equipment and instrumentation; sampling procedures and analytical methods, types of data to be collected; flow sheets; construction design concepts; calculations; flow capacities; phasing of the project (including target dates for the phases); method of evaluating results; reporting schedules; etc. Applications relating to projects involving storm and/or combined sewers or other projects in which the collecting sewers affect the study or demonstration should include description of the portions of the system involved in the project, rainfall characteristics, discussion of points of overflow or by-pass and other factors critical to project design and performance.

4. Project Facilities

   Describe the laboratory, plant, or other facilities and major items of equipment (a) available and (b) needed for the project. Itemize and justify items of needed equipment costing over $2,500. Major items to be determined during the course of project engineering design and planning not yet accomplished need not be included.

PART II, SECTION B, SUPPORTING INFORMATION (To be provided on Blank Pages Titled, "PART II, SECTION B, SUPPORTING INFORMATION")

1. Project Personnel

   Provide brief biographical data for the Project Director and other principal personnel proposed for conducting the project. Describe

Designation - Name
Block
Remarks

experience that is particularly pertinent to the proposed project. Be sure to include the following items:

(a) Social Security Number
(b) Professional Title
(c) Education, degree, and year conferred (begin with baccalaureate training and include postdoctoral)
(d) Major research and/or professional interest

2. Other Project Activity

List all active research, development, and demonstration projects in which the Project Director is engaged. For each project, identify the following:

(a) Supporting agency or organization
(b) Grant or contract number
(c) Title of Project
(d) Time (hours) or effort (percent of total working time) of the Project Director
(e) Estimated project costs
(f) Project period with dates

Identify any other agencies or organizations to which this application has been submitted.

3. Publications and References

(a) Cite important publications or reports by the Project Director and other principal personnel which relate to this or similar work.

(b) Discuss important publications or reports by others which are significantly related to the proposed project.

PART II, SECTION C, MISCELLANEOUS INFORMATION (To be provided on blank pages titled, "PART II, SECTION C, MISCELLANEOUS INFORMATION")

1. For Class I and II continuation applications, Part II shall include a summary of expenses, by major budget categories, for the funded year in progress, as follows:

		Budget Categories		
Column (1) Current Budget	Column (2) Actual Expenditures Through_____	Column (3) Estimated Additional for Remainder of Current Grant Period	Column (4) Total Estimated (Col.2 plus Col. 3)	Column (5) Estimated Unexpended Balance (Subtract Col. 4 from Col. 1)

2. For Class I and II grants, if continuation support is desired, it is the responsibility of the grantee to submit the continuation application to FWPCA in sufficient time prior to the expiration of the present grant period so that review and decisions may be made. Continuation applications should be submitted at least twelve weeks prior to expiration of the grant period. A progress report (an original and 7 copies) is required and becomes part of the continuation application.

3. Costs for purchases or rental of land are generally not allowable as costs to be supported by Federal funds. Complete information must be provided to assure that the applicant has legal right for use of land involved at least for the duration of the project.

WPRD-186-01-68

APPLICATION FOR RESEARCH AND DEVELOPMENT GRANT
CUYAHOGA COUNTY SEWER DISTRICT IMPROVEMENT NO. 615
ROCKY RIVER WASTEWATER TREATMENT PLANT
DETAILED DESCRIPTION OF PROJECT
CHEMICAL CLARIFICATION AND CARBON FILTRATION-ADSORPTION
AS SECONDARY TREATMENT

REVISION OF PROJECT TO INCLUDE PHOSPHATE REMOVAL

INTRODUCTION

The original application for a research and development grant applied to a process of secondary treatment employing chemical clarification using polymer flocculants and carbon filtration and adsorption. The application is revised to incorporate investigation on a plant scale basis of the use of various coagulants and coagulant aids in the clarification phase of the process for the purpose of effecting phosphate removal.

The following statements are additions to the statements of original application, listed in conformance with the outline of the original application and section headings:

PROJECT PLAN

1. OBJECTIVES

The original objectives of the project remain - the practical application of the principles of clarification and carbon adsorption and filtration to provide an advanced method of secondary treatment. It is understood, however, that the secondary treatment objective includes also the removal of phosphate from the wastewater to the extent possible by the clarification and carbon processes and within the limits of capability of existing facilities to handle the resulting solids load (sludge thickening, digestion, vacuum filtration and incineration).

2. PLAN OF OPERATION

To the plan of operation the following is added:

3A) On a plant scale basis investigate a) the effect of the use of various coagulants (e.g., alum, lime, ferric sulfate) and coagulant aids (polymers) in the existing clarification phase of the process in the removal of phosphate and b) the amount of sludge produced in the use of coagulants as compared with normal operation and problems in handling such sludge as compared with normal sludge. It is proposed that this investigation be carried out as soon as practical and prior to the completion of construction of the proposed carbon process installation. So far as possible the investigation will be made using one of the four existing primary aerated clarifiers by split treatment in order to make comparisons with normal operations

Investigations during the trial operating period (post-construction) will include the following modification:

5) h) Based on the results obtained in the work under 3A investigate efficiency of phosphate removal by the clarification and carbon process employing selected coagulants and coagulant aids.

3. NEED FOR PROJECT

A further need for the project is to demonstrate the capabilities of the clarification process and carbon process in the removal of phosphate and to accumulate essential data thereon.

4. FACILITIES AVAILABLE

For the purpose of the initial investigation of phosphate removal by coagulation, the existing primary treatment installation includes facilities for polymer and chemical application and rapid mixing for the total waste flow and flocculation by diffused air and sludge recirculation by air lift in each settling tank. No means are now available for rapid mixing in the individual settling tanks, for direct measurement of sludge produced and for the separate handling (thickening and digestion) of the sludge. Separate rapid mixing, a probable requirement, can be provided by revamping the existing mix chamber or possibly by turbulence in the clarifier influent pipe. Polymer and chemical feeding can be adapted for application to a single tank. Provision can be made by piping change to separately thicken and vacuum filter raw sludge. Investigation of experimental digested sludge handling is not practical. It may be necessary to investigate the quantity of sludge and its characteristics on a laboratory scale.

SUPPLEMENTAL DATA

5. PROPOSED BUDGET DETAILS

Adjustments have been made to the preliminary estimates of construction cost based on more elaborate building, equipment and control system for the carbon process, provision for phosphate treatment as part of clarification, and changes in the miscellaneous plant improvements as now visioned.

The following then is a revised preliminary estimate of funds required for the proposed project, including construction cost for the clarification-carbon process installation for a 10 mgd plant and other plant improvements considered advisable and operation and research costs for the initial investigation of phosphate removal by coagulation in the existing primary clarification installation and of solids handling and similarly for the post-construction study and report.

	Grant Participation	Total Project
1. Construction

BUDGET FOR PHOSPHATE TREATMENT STUDY

A. PLANT PREPARATION

1.	Revamp existing rapid mix chamber to provide mixing of chemicals for a single aerated clarifier by partitioning tank and moving mixer	$ 1,200
2.	Revise thickened sludge piping to permit bypassing of digesters and vacuum filtration of raw thickened sludge	500
3.	Provide separate primary sludge line from one clarifier to one sludge thickener to permit separate handling of experimental sludge	3,200
4.	Provide lift truck for bag handling of chemicals	3,800
		$ 8,700

B. PURCHASE OF CHEMICALS

Average flow for one clarifier - 4 mgd
Three runs of 5 days each with each coagulant at different dosages

Lime at 300,400, & 500 ppm	15 days @ $160	$ 2,400
Alum at 100,200, & 300 ppm with lime	15 days @ $224	3,360
Ferric sulfate at 100,200 & 300 ppm with lime	15 days @ $240	3,600
Coagulant aid at 1 ppm	45 days @ $ 50	2,250
Other coagulants (ferrous chloride, aluminate, etc.)	15 days @ $200	3,000
		$ 14,610

C. OPERATIONAL LABOR AND PERSONNEL

Additional labor required for tests and report over and above normal labor.

Supervisor of operations	2 hr per day - 60 days 120 hr @ $7	$ 840
Superintendent	4 hr per day - 60 days 240 hr @ $5	1,200
Operator for chemical feed	16 hr per day - 60 days 960 hr @ $4	3,840
Operator for sludge filter	8 hr per day - 20 days 160 hr @ $4	640
Lab technician	4 hr per day - 30 days 120 hr @ $4	480
Mechanic & Misc. labor	8 hr per day - 15 days 120 hr @ $5	600
Report writing (supervision)	40 hr @ $7	280
Consulting Engineer	15 days @ $100	1,500
		$ 9,380

Re: Rocky River
Wastewater Treatment Plant
R & D Grant No. 11010 DAB

Dear Sir:

We have reviewed the terms of the original federal grant and have revised the eligible costs based on bid prices for construction and adjusted cost of related activities including phosphate treatment, post-construction studies and first year operation and maintenance of the demonstration facilities. The bid prices are based on low bidders. In view of possible litigation on the low bidders the final cost may increase.

The original federal grant application was dated November 8, 1967 and revised on May 7, 1968 to include phosphate treatment. The increase in cost is due to the lack of reliable experience data on a totally new sanitary engineering process and inflationary cost increase during the past several years.

The federal agency in its grant offer excluded from eligible cost the cost of substructures and foundations for the settled sewage pumping station and carbon contactor facilities, and the superstructures. We are in agreement that the treatment facilities could be conceivable constructed and operated without superstructures. The pumping station and carbon facilities however, could not be constructed and operated without a wet well, dry well and foundations. We have therefore taken the liberty to add to the eligible cost these substructures and foundations. We have also approximately doubled the cost of the experimental phosphate treatment after further considering the practicality of our original conception.

The requested grant is $1,413,000 including research costs and [illegible] first year operation of the demonstration facilities. By comparison, [illegible] project were today eligible for a 30% federal grant or an Ohio Water [illegible] Grant Authority subsidy of 30% the grant would be approximately $1,125,000 (30% x $3,000,000 constructioncost + 25% overhead). If the eligible cost does not include the above mentioned substructures, etc. the grant will amount to $1,125,000 for construction according to our determination.

We believe that the data herewith attached is sufficient for your application for an increase in grant amount.

Very truly yours,

WILLARD F. SCHADE AND ASSOCIATES

BY Willard F. Schade

[illegible] 25, 1970

Eligible costs have been determined in accordance with the terms of the [illegible] grant offer dated July 22, 1966, page 2A. Construction costs have been taken from bids obtained on June 11, 1970 (see attach[illegible] breakdown). Cost of phosphate studies, post-construction studies and operation and maintenance are up-dated from those given in the revised application submitted to Cuyahoga County on May 7, 1968.

ELIGIBLE COSTS

1. Construction		$ 2,256,140
2. Technical Services		
A. Phosphate studies	$ 60,000	
B. Plans and specifications, 4.31%	97,260	
C. Supervision of construction, 1.44%	32,450	
D. Resident engineer and inspector, 4.0%	90,250	
E. Post-construction studies	65,000	
		$ 345,020
3. Operation and Maintenance		
A. Personnel, power, supplies	$ 70,000	
B. Phosphate treatment and additional sludge handling @ 4¢ per 1000 gal.	155,000	
		$ 225,000
4. Total Eligible Cost		$ 2,826,160
5. Federal Grant Offer (50%) or		$ 1,413,000

[illegible] [illegible]

[illegible] Basic building electrical work, bar screen, effluent pump processing, degritting, and disintegrator

Total Bid	$ 145,697	
Less building electrical 11921 sq ft @ 1.50	-17,881	
Total HP - 947	127,816	
Less deleted HP - 53 or 6.1%	-7,796	$ 120,020.00
	Total	$ 1,975,982.00

The General grant offer has been interpreted to consider ineligible the substructures and foundations required to install the settled sewage pumps and the carbon contactors and regeneration, and the superstructure to house these facilities. The substructures and foundations of the settled sewage pumps and carbon contactors are an intrinsic part of these facilities, that is, the pumps and carbon contactors could not be installed without the substructures and foundations and these substructures and foundations have no value except as a part of the equipment facilities. Therefore the cost of the substructures and foundations is herewith added to the eligible cost of the equipment facilities as determined below.

COST OF SUBSTRUCTURE AND FOUNDATIONS

CONTRACT NO. 1 GENERAL CONSTRUCTION

Item 1	Excavation for Carbon Contactors	5350 CY @ $10.30	$ 55,[illegible]

OFFER AND ACCEPTANCE OF FEDERAL GRANT FOR RESEARCH AND DEVELOPMENT
UNDER 33 U.S.C. 466 et seq.

The Environmental Protection Agency pursuant to the Federal Water Pollution Control Act, as amended, and the attached Rules and Regulations hereby offers to the Applicant named herein a grant to assist in the accomplishment of the project described in the application provided the Agency receives from the Applicant within thirty days; 1) the Patents and Inventions Article Agreement, 2) the Assurance of Compliance (Title VI, Civil Rights Act of 1964), and 3) the completed Offer and Acceptance Document. The Offer is as follows:

A. Location of Project (State, City) Ohio, Rocky River

B. Legal Name and Address of Grantee Board of County Commissioners
Cuyahoga County
1219 Ontario Street
Cleveland, Ohio 44113

C. Financing Under Terms of this Offer

Period of this Grant commencing August 16, 1968 and ending July 31, 1973

Eligible Grant Period Costs for EPA Participation . . . . . $2,573,810.*

EPA Grant Offered . . . . . $ 250,000.
or 38.52 %** of Eligible Grant Period Costs, whichever is less.

Future support will be subject to availability of funds and successful development of this project.

D. Progress, final, and other reports including the number of copies and the routing required are specified in the Special Offer Conditions. The grantee agrees to prepare an abstract of the final report for the Water Resources Scientific and Information Center, Department of the Interior. Forms and Guidelines will be supplied by Project Coordination, Office of Research and Development.

A completed Notice of Research Project for the Science Information Exchange is required for this project. Forms and instructions are enclosed.
X is not required for this project.

*Revised.

**Based on total award, including this supplement.

ENVIRONMENTAL PROTECTION ... OFFICE

11010 DAB Supp.
Program (Project) Number

E. Description of Project

Title: Chemical Clarification, Carbon Filtration and Adsorption, and Phosphate Removal as Secondary Treatment for Rocky River Wastewater Plant.

Project Objectives and Description of Work:

The Rocky River Plant will demonstrate physical-chemical treatment at 10 MGD in place of conventional biological activated sludge. Polymer flocculants will be used for chemical clarification; phosphate removal will be effected by use of various coagulants and coagulant aids. The primary clarified effluent will be padded through columns of activated carbon for filtration of suspended solids and adsorption of organic pollutants. Preliminary studies will be made to select polymers and coagulating chemicals for achieving the most effective treatment of the full-scale waste stream. The plant will include sludge disposal from the primary tanks by anaerobic digestion; digester solids will be incinerated; digester supernatant will be treated in a small activated sludge unit wh ch includes mineral addition. Operating procedures, design criteria and cost information will be developed during the demonstration phase.

Program (Project) Number

G. Special Offer Conditions:

1. Reports:

Unless otherwise formally agreed upon or specified herein, the following reports shall be prepared by the Grantee and forwarded as follows:

a. Final Project Report - Four copies of the final manuscript shall be sent to the EPA Project Officer by registered mail, for final approval, within three months after completion of the project. After receiving final approval, the Grantee shall send the reproducible master manuscript (camera-ready) to Head, Projects Reports System, Office of Research and Development, EPA, Room 1108, Washington, D. C. 20242, by registered mail. Reproduction of the report will be accomplished in accordance with the current Government printing and Binding Regulations. Photo-offset printing methods will be used. Grantee will be provided with 50 copies of the report when reproduced. Preparation of the report shall be in accordance with the enclosed "Final Report Specifications for Grant, Contract, and In-House Projects, March 1970."

b. Annual Progress Report - Ten copies of an interim or annual progress report describing the progress made, including comments or any other significant information or problems, are to be submitted to the assigned EPA Project Officer.

c. Monthly Progress Report - Three copies of a monthly progress report are to be submitted for Class III, Class IV and Class V grants. Details on report content will be supplied by the assigned EPA Project Officer.

2. Name Change. Wherever Federal Water Pollution Control Administration, or FWPCA, and Federal Water Quality Administration, or FWQA, appears herein, it shall mean Environmental Protection Agency, or EPA, respectively.

3. In addition to the patent provisions attached to this Grant Offer, in the case of any grant calling for experimental or developmental research work or work intended to establish either the technical value or the economic feasibility, in connection with either waste treatment or water pollution control, of a process, machine, article of manufacture or composition of matter, rights to which are owned by a party other than the grant applicant and which has not been sold or offered for sale to the public in the commercial open market, or in the case of a process, has not

11010 DAB Supp.
Program (Project) Number

been made available in a manner such that its benefits are generally accessible to the public, the grant applicant shall:

(a) Obtain from the owner of such rights a written agreement that said owner will itself or through a licensee make the subject matter of such rights available in the commercial open market to all interested members of the public, or will license others to do so, on reasonable terms and reasonable royalties. The grant applicant shall submit a copy of such agreement to the Administration along with its grant application; and

(b) Obtain for the Government, with regard to information pertaining to a process, machine, article of manufacture, or composition of matter which is a vital part of a proposed research or demonstration project and is proprietary to a party other than the grant applicant, (1) sufficient functional, generic, and mechanical description relative thereto to enable an understanding of its subject matter relative to the project, and (2) permission for the Government to disseminate freely all data and information obtained as a result of such project, as well as the aforementioned functional, generic, and mechanical description.

4. Completion of PI Form 1350, Assurance of Compliance, Title VI of the Civil Rights Act of 1964 (P.L. 88-352) is required.

5. Progress payments will be made on a reimbursable basis and will be based on progress and expenditures reported in the periodic progress reports required in Item 1.

6. The applicant will act in accordance with the contents and conditions imposed by the following attached documents: Tentative Rules and Regulations, Research and Development Grants; FWPCA Patents and Inventions Article; and Section 6 of the Clean Water Restoration Act of 1966.

7. Grant funds in the amount of $10,000. will be withheld pending receipt of the final report and completion of the final audit.

8. This grant is not to be regarded as relieving you of responsibility for meeting any requirements imposed under Federal, State, or local authority for providing required treatment insofar as presently available technology permits.

9. Revocation of grants. After consultation with the Project Director(s) and the Grantee Institution, a grant may be revoked, in whole or in part, except that a revocation shall not affect any commitment of grant funds.

11010 DAB Supp.
Program (Project) Number

which in the judgment of the EPA and the Grantee, had become firm prior to the effective date of the revocation. Upon revocation, the Grantee shall reduce, insofar as is possible, the amount of outstanding commitments and repay by check identified by the appropriate grant number, the uncommitted balance of all funds paid the Grantee under this grant. The most common cause for revocation is expected to be the inability of the Grantee to carry out the research for which the grant is made, or to adhere to other conditions set forth in the grant instrument. As a general rule, the availability of the services of the Project Director(s) named in the grant instrument is one of the conditions of the grant. Consequently, EPA shall be informed immediately, whenever it appears that the Project Director(s) find it impossible to continue to direct the research.

10. Mr. Arthur N. Masse will continue as the assigned EPA Project Officer.

11. The project plan, project schedule and budget presented in your application (and "Revision of Project to Include Phosphate Removal") dated November 1, 1967, and in your supplemental application dated August 5, 1970, is the basis for this Offer and shall be adhered to unless modified by mutual agreement.

REFER TO:
11010 DAB Supp.

Dear Mr. Puzenski:

Your application dated August 5, 1970, for supplemental funding of the above grant has been approved in the amount of $250,000 or 38.52% of the revised total eligible costs $2,573,810. This supplemental funding makes the Environmental Protection Agency support of the project total $991,350.

The grant offer is subject to the terms and conditions set forth in the enclosed Offer and Acceptance document and attachments. Acceptance of this offer must be made by completion of page 5 and returning one signed copy of the complete document within the next thirty (30) days. Retain a signed copy of this agreement for your records.

We wish to encourage you in this demonstration project and are looking forward to receiving the final report.

Sincerely yours,

Acting Commissioner
Water Quality

U.S. DEPARTMENT OF THE INTERIOR
ASSURANCE OF COMPLIANCE
(TITLE VI, CIVIL RIGHTS ACT OF 1964)

Board of County Commissioners
Cuyahoga County, Cleveland, Ohio
(Name of Applicant-Recipient) (hereinafter called "Applicant-Recipient")

HEREBY AGREES THAT IT will comply with Title VI of the Civil Rights Act of 1964 (P.L. 88-352) and all requirements imposed by or pursuant to the Department of the Interior Regulation (43 C.F.R. 17) issued pursuant to that title, to the end that, in accordance with Title VI of that Act and the Regulation, no person in the United States shall, on the ground of race, color, or national origin be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity for which the Applicant-Recipient receives financial assistance from LPA (Bureau or Office) and

Hereby Gives Assurance That It will immediately take any measures to effectuate this agreement.

If any real property or structure thereon is provided or improved with the aid of Federal financial assistance extended to the Applicant-Recipient by LPA (Bureau or Office). This assurance obligates the Applicant-Recipient, or in the case of any transfer of such property, any transferee for the period during which the real property or structure is used for a purpose involving the provision of similar services or benefits. If any personal property is so provided, this assurance obligates the Applicant-Recipient for the period during which it retains ownership or possession of the property. In all other cases, this assurance obligates the Applicant-Recipient for the period during which the Federal financial assistance is extended to it by LPA (Bureau or Office).

THIS ASSURANCE is given in consideration of and for the purpose of obtaining any and all Federal grants, loans, contracts, property discounts or other Federal financial assistance extended after the date hereof to the Applicant-Recipient by the bureau or office, including installment payments after such date on account of arrangements for Federal financial assistance which were approved before such date. The Applicant-Recipient recognizes and agrees that such Federal financial assistance will be extended in reliance on the representations and agreements made in this assurance, and that the United States shall reserve the right to seek judicial enforcement of this assurance. This assurance is binding on the Applicant-Recipient, its successors, transferees, and assignees, and the person or persons whose signature appear below are authorized to sign this assurance on behalf of the Applicant-Recipient.

ADVANCED WASTE TREATMENT SEMINAR
CLEVELAND ENGINEERING CENTER
April 22 & 23, 1971

EXISTING ROCKY RIVER WASTEWATER TREATMENT PLANT

The purpose of this paper is to discuss the present plant with a brief description of the existing method of treatment and facilities provided to meet the treatment objectives.

The present plant was designed about 1960 using "Intermediate" treatment, basically consisting of chemical coagulation, settling and chlorination. This plant replaced the existing primary treatment plant of two million gallons per day capacity which was grossly overloaded.

By contractual agreement between the several cities to be served by the plant and the County acting as the fiscal and operating agency, the design capacity of the plant was set at 16 million gallons per day. The ultimate population figure of 116,700 persons was determined by the Cuyahoga County Real Property Inventory in 1956. At the time it was felt that the service area was determined for all time and that it would not be unreasonable to provide the ultimate expected capacity.

Four cities make up the service area and include the cities of Rocky River, Bay Village, Fairview Park and Westlake. The total area comprises about 29 square miles with the City of Westlake being equal to about half of the service area.

The City of Westlake is now constructing trunk, lateral and local sanitary sewers. The first flow of sanitary sewage to the Rocky River Wastewater Treatment Plant was received in December, 1970. The present flow of sanitary sewage from the City of Westlake is approximately 600,000 gallons per day.

Returning to the original design, the present plant capacity was set for a population equivalent of 116,700 persons contributing an average of 137 gallons per capita per day for a total design flow of

16 million gallons per day. Allowance was made hydraulically to pass 200% of the average daily flow, or 32 million gallons per day, through the plant with excess storm flow bypassed directly to the outfall sewer From the 1970 annual report wastewater strength was below normal and domestic with a suspended solids content of 179 mg/l and a BOD of 144 mg/l.

Features of the existing plant include a plant by-pass, trash racks, mechanical screening, flow measurement, aerated tanks for grit removal and washing, flash mixing, preaeration, chemical flocullation and settling in four circular tanks, chlorination and final discharge through an outfall sewer extending 1,500 feet into Lake Erie Sludge handling facilities consist of continuous sludge withdrawal from the settling tank to a pair of circular sludge thickeners, two primary anaerobic digestors and one secondary digestor. Digested sludge disposal is accomplished on two vacuum filters with the cake going to landfill or to a multiple hearth incinerator for final disposal. Supernatant from the digestors is returned to the plant influent.

During the period 1964 through 1966 the average daily flow to the plant increased from 4.3 million gallons per day to 5.6 million gallons per day with an average load of 173 mg/l suspended solids and 144 mg/l BOD. The 1970 average flow was 7.53 million gallons per day, BOD 144 mg/l, ss 179 mg/l.

The Board of County Commissioners of Cuyahoga County, Ohio employed Willard F. Schade and Associates to make preliminary investigations, studies and to report on secondary treatment at the Rocky River plant to maximize reduction of BOD, phosphate and coliform concentration, including a general plan, approximate estimate of cost and an investigation of proximity of residences to the treatment plant. Late in 1966 a report was prepared with the recommendation that secondary treatment facilities utilizing the activated sludge process and variation thereof be constructed to treat a flow of 9.33 mgd and population of 90,000 persons with provision to expand the plant to 16 million gallons per day by adding additional final clarifiers at some date after 1980. This first stage of construction would include six aeration tanks, two final clarifiers and two aerobic digestion tanks for waste activated sludge. A future second stage of construction would include conversion of the aerobic digestion tanks to aeration tanks and adding two additional final clarifiers. To accomplish this plan it was further recommended that the County acquire 2.6 acres of privately owned land immediately east of the present plant to accommodate the proposed secondary facilities. A general plan of the layout is shown on Figure . The secondary treatment was based on present day standards of design for activated sludge.

The preliminary report and general plan were approved by the State of Ohio, Department of Health. However, it was deemed necessary to secure

the approval of the general plan from the four municipalities that were party to the agreement providing for the construction and operation of the expanded facility.

Objections to the proposed improvement were raised by residents whose property was required for the proposed secondary treatment construction. The objections were strong and the objectors influential so that it appeared that approval by the City of Rocky River would not be received.

Several alternate arrangements and locations of the secondary treatment facilities were made in an attempt to fit the proposed plant within the area available to the County.

The original plan had envisioned an activated sludge plant using standard air diffusion equipment and circular final clarifiers suitably arranged to permit maximum flexibility of operation. It would have been possible to use the standard system, step aeration, or contact stabilization, and during the first stage, aerobic digestion of waste activated sludge.

Two alternate plans were then developed to meet the requirements of an extremely limited area. The first alternate plan was developed around the idea of a "complete mix" activated sludge at an aeration tank loading rate of 125 lbs BOD_5 per 1,000 cubic feet of aeration tank and a 700 gallon per square foot per day overflow rate for the final tanks. Under this plan the aeration tank loading was almost 4 times the 32 lb rate used in the original plan. It was possible to fit this complete mix plant on the limited site available. The second alternate plan developed was even more daring -- secondary treatment using granular activated carbon. Preliminary evaluation of this second plan showed that area requirements would be the minimum as shown on Figure 1 and pilot plant study indicated the system would work.

The following is a comparison of the area requirements for the original plan and the two alternates.

Standard Activated Sludge	66,000 square feet
Complete Mix	14,000 square feet
Granular Carbon	15,000 square feet

Actually the standard activated sludge plant would require 90,000 square feet, the 66,000 square feet figure representing only the surface area of the tanks. Based on volume the standard activated sludge plant required about 700,000 cf of tankage. The carbon system required on the other hand 360,000 cf of building volume to completely house the facilities

Further study was made of the granular activated carbon system mainly in the realm of published papers and reports of pilot plant study by our County staff under the direction of Mr. Paul Beck, Supervisor of Treatment Plants. Actually the carbon system has been in general use for color and turbidity removal in water supply, tertiary treatment of secondary treatment effluent, clarification of sugar syrups, treatment of pharmacueticals, and removal of tar and nicotine in cigarette smoke. But research did not reveal the use of the carbon system as a secondary treatment of wastewater.

Faced with the problem of land acquisition and esthetic considerations the decision to move ahead with the design of the granular activated carbon system was made based on the following points:

1. The carbon system could be placed well within the space available.

2. The entire secondary treatment system could be completely housed and would be a closed system.

Cleveland, Ohio 44113

Dear Mr. Puzenski:

Mr. Willard Schade and I met in Cleveland on April 22 to discuss the plans and specifications for the Rocky River plant. The plans and specifications as revised by Mr. Schade's letters of April 2, April 7 and April 16 to me and by our discussion in Cleveland are hereby approved.

Sincerely yours,

A. N. Messe

Re: Rocky River Wastewater
Treatment Plant
Sewer District Improvement
No. 615-A

Gentlemen:

A letter dated January 31, 1973 from Dr. Irwin J. Kugelman, Project Officer at the Advanced Waste Treatment Research Laboratory, Cincinnati, Ohio, strongly recommends that the carbon adsorption system at the subject plant be redesigned to increase the operating pressure from 30 pounds per square inch to 50 pounds per square inch.

The above recommendation is based upon a study conducted by the Environmental Protection Agency in a pilot plant simulating the design and operation of the plant being constructed at Rocky River. The total additional cost of the recommended work is now estimated to be $250,000.00.

Authority is hereby requested for the Sanitary Engineer to prepare the necessary Change Orders to effectuate the recommendations of the Environmental Protection Agency.

Very truly yours,

John H. Puzenski

John H. Puzenski
County Sanitary Engineer

jhp//mj

prepare the necessary [illegible] the redesign of the carbon adsorption system at the Rocky River Wastewater Treatment Plant, in order to increase the operating pressure from 30 pounds per square inch to 50 pounds per square inch, as recommended by the Environmental Protection Agency, estimate cost of the recommended work being $250,000.00.

WHEREAS, John H. Puzenski, Sanitary Engineer, under date of February 8, 1973, presented to the Board of County Commissioners, for its approval, a request for authority to prepare the necessary Change Orders to provide for the redesign of the carbon adsorption system at the Rocky River Wastewater Treatment Plant, in order to increase the operating pressure from 30 pounds per square inch to 50 pounds per square inch, as recommended by the Environmental Protection Agency, estimated cost of the recommended work being $250,000.00; and

WHEREAS, Commissioner Hugh A. Corrigan, voted against the request made by Mr. Puzenski; and

WHEREAS, John L. Dowling, Assistant Prosecuting Attorney, directed the Board's attention to Section 305.23 of the Revised Code of Ohio, that where a proposition involves an expenditure of one thousand dollars or more, it shall not be agreed to by the Board unless twenty days have elapsed since the introduction of the proposition, unless unanimous consent of all the members of the Board present has been had; and

WHEREAS, in view of the above, Commissioner Taft and Commissioner Pokorny, by resolution adopted February 8, 1973, deferred action and approval of the request made by Mr. Puzenski for a period of twenty days; and

WHEREAS, Commissioner Corrigan is now of the opinion that the preparation of the above-mentioned Change Orders should be authorized; and

WHEREAS, an oral opinion of the Prosecuting Attorney was requested by Commissioner Corrigan relative to the provision of Section 305.23 of the Revised Code of Ohio as indicated above; and

WHEREAS, John L. Dowling Assistant Prosecuting Attorney expressed his opinion that any time within the twenty day period provided for in Section 305.23 R.C., a dissenting Commissioner may bring up the matter for consideration and upon unanimous consent of the Board of County Commissioners the proposition may be agreed to; and

WHEREAS, Commissioner Taft and Commissioner Pokorny adhered to their original position in favor of the preparation of said Change Orders.

NOW, THEREFORE, Be It Resolved by the Board of County Commissioners of Cuyahoga County, Ohio, the John H. Puzenski, Sanitary Engineer, be, and he is, hereby authorized to prepare the necessary Change Orders to provide for the redesign of the carbon adsorption system at the Rocky River Wastewater Treatment Plant, in order to increase the operating pressure from 30 pounds per square inch to 50 pounds per square inch, as recommended by the Environmental Protection Agency, estimated cost of the recommended work being $250,000.00

BE IT FURTHER RESOLVED that the Clerk of the Board be, and she is, hereby instructed to transmit a copy of this resolution to John H. Puzenski, Sanitary Engineer and John L. Dowling, Assistant Prosecuting Attorney.

On Motion of Commissioner Corrigan, seconded by Commissioner Taft, the foregoing resolution was duly adopted.

Journal 142, Page ___ Ayes: Taft, Corrigan, Pokorny. Nays: None. Resolution Adopted.

Louise M. Bulock

COUNTY OF CUYAHOGA, OHIO

Application for Reimbursement Grant

Federal Water Pollution Control Act Amendments of 1972

Project No. 11010 DAB

October 12, 1973

(12)

1. Brief Description of Project

Chemical clarification and carbon filtration and adsorption as secondary treatment for Rocky River Wastewater Treatment Plant, County Sewer District Improvement No. 615-A.

2. Total Eligible Project Cost

Contract No. 1, General Construction	3,200,000.00
Contract No. 2, Plumbing Work	56,000.00
Contract No. 3, Ventilating Work	8,000.00
Contract No. 4, Electrical Work	148,000.00
Contract No. 5, Activated Carbon	199,000.00
Total Construction Cost	3,611,000.00
Engineering, legal, fiscal, contingencies, etc.	430,000.00
Total Eligible	4,041,000.00

3. Total Amount of Federal Assistance Received to Date

No federal assistance received to date.
Grant offer made of $991,330.00, of which only $790,030.00 can be used for construction.

4. Additional Financial Assistance Requested

55% x 4,041,000 - 790,030 = 1,432,320.00

5. Construction Dates

Initiation of Construction	October 31, 1972
Completion of Construction	Estimated October, 1974

6. Date of Approval by Ohio Department of Health

Letter dated June 30, 1969.

Approved John W. Puszeski
John W. Puszeski
County Sanitary Engineer

(13)

RESOLUTION

Instructing and Authorizing John H. Puzenski, County Sanitary Engineer, to make application for Reimbursement Grant as provided for in the Federal Water Pollution Act Amendments of 1972, for the Rocky River Wastewater Treatment Plant, in the amount of $1,432,520.00.

- -

BE IT RESOLVED by the Board of County Commissioners of Cuyahoga County, Ohio, that John H. Puzenski, County Sanitary Engineer, be, and he is, hereby instructed and authorized to make application for Reimbursement Grant as provided for in the Federal Water Pollution Act Amendments of 1972, in the amount of $1,432,520.00, for the Rocky River Wastewater Treatment Plant, County Sewer District Improvement No. 61[illegible], Project No. 11010 DAE.

On Motion of Commissioner Taft, seconded by Commissioner Corrigan, the foregoing resolution was duly adopted.

Ayes: Taft, Corrigan, Tolerny.

Nays: None.

Resolution Adopted.

LOUISE M. MULACK,
Clerk of the Board

U.S. ENVIRONMENTAL PROTECTION AGENCY

GRANT AMENDMENT

Page 1 of 2 Pages

GRANT NO. 11010 DAB

AMENDMENT NO. 4

OTE: The original Amendment with one copy must be executed and returned to the Grants Administration Division for Headquarters grant wards and to the Grants Administration Branches for State and local assistance awards within 3 weeks after receipt or within any extension of me as may be granted in writing by EPA. Except as may be otherwise provided, no costs as a result of the Amendment may be incurred prior the execution of the Grant Amendment by the parties thereto.

Receipt of a written refusal, or failure to receive the properly executed document within the prescribed time will result in the termination f consideration to the Grant Amendment by EPA

ENVIRONMENTAL PROTECTION AGENCY PROGRAM REQUIREMENTS MEMORANDUM 75-11

April 17, 1974

SUBJECT: Approval of Reimbursement Projects Not Previously Serviced by EPA

FROM: John T. Rhett
Deputy Assistant Administrator for Water Operations (AW-446)

TO: Regional Administrators
ATTN: Air and Water Program Directors

This is in response to a need for more specific guidelines required to properly review and process applications for reimbursement under Section 206 which were not previously serviced by EPA. The Office of General Counsel has provided us with an opinion regarding the legal issues involved and the mandatory requirements which applicants must meet. It is attached for your information and should be reviewed before undertaking action on the "woodwork" projects.

So that the review can be conducted using itemized specific requirements, we are supplementing the legal opinion with a checklist of applicable provisions. These provisions represent minimum compliance requirements to be met by the previously unserviced projects prior to approval for award.

Initially it is necessary that certain actions on each of the projects be fulfilled by the *State*. They are as follows:

1. Provide a copy of the State Permit, or provide certification that the project was designed and built in accordance with regulations and requirements of the State Agency.

2. Certify that the facility, upon completion, was operated consistent with State requirements. (If the facility is not currently being operated, an explanation of the mitigating circumstances must be provided.)

3. Provide a statement to the effect that the project was constructed for benefit of public at large. The statement must address the public benefits derived by project construction; the relation of the ultimate cost of constructing and maintaining the works to the public interest; and the public necessity of the treatment works.

Upon receipt of the above, the remainder of the review will be based on information submitted by the applicant. Since it is likely that all of the needed items of data will not be on hand with the applicant's original application, it will be necessary to request them in writing. In that letter, it is important to remind the applicant of the fact that eligibility for reimbursement is limited solely to treatment works as defined in Section 8 of the Federal Water Pollution Control Act prior to the October 18, 1972 Amendments thereto (i.e., sewage treatment plants including additions, modifications, alterations, etc., and appurtenant intercepting and outfall sewers, force mains and pump stations. Collection sewers, etc., are not eligible for reimbursement grant consideration.

In addition to the fact that the municipality's application must have been on file in the regional office by January 31, 1974, with the elements of data required in the published regulations, the following items are also needed to determine its eligibility.

1. Certification that standard procurement procedures were followed—with all contracts awarded to the lowest responsive bidder(s); and that proof of advertising, bid tabs, etc., will be available upon audit. Certification that all costs applied for have been paid and that evidence of such payment will be available upon audit.

2. Certification that the contractors paid the same general level of wages to their employees as was paid to those similarly situated at the time.

3. A resolution from the applicant's governing body authorizing a representative, by name and title, to execute and file all documents regarding the project.

4. Evidence that the project was approved by the appropriate planning agency. (Applicable to projects applying for the 10% planning bonus.)

5. A true copy of each executed contract document.

6. One copy each of the approved final construction estimate and bills submitted to the municipality for engineering services rendered. Requests for grant assistance for legal costs, bond costs, administrative costs, etc., should be discouraged. However, where applicant desires such grant support, bills pertaining to such costs must be furnished. If the construction estimate does not include signatures of the consulting engineer, the contractor, and the municipality, appropriate documentation substantiating the concurrence of the three parties should accompany the construction estimate.

7. Compliance Report Form (158 R0034), EPA Form No. 4700-4—to indicate nondiscrimination.

8. In addition, the grantee must be notified that, should his project be otherwise approved for reimbursement, in accepting the grant he must also accept the condition to acquire and maintain *flood insurance* where applicable and available.

9. If project is still under construction, it will be necessary to assure compliance with the additional requirements of the General Counsel memorandum.

A. Relocation Assistance
b. E.O. 11246 (equal employment opportunity)
c. Copeland Act; for contracts and subcontracts awarded subsequent to the date of the reimbursement grant award.

This memorandum has been concurred in by the EPA Office of Audit.

Attachment

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

March 28, 1974

SUBJECT: Federal Requirements Applicable to the Award of Grant Assistance under Sec. 206 of the 1972 FWPCA Amendments (33 U.S.C. 1286).

FROM: Joseph M. Zore
Assistant General Counsel, Grants
(EG-334)

TO: John T. Rhett
Deputy Assistant Administrator for
Water Program Operations (AW-446)

Section 206(a) of the 1972 FWPCA Amendments (33 U.S.C. 1286), as amended on December 28, 1973 by Public Law 93-207 (87 Stat. 906) authorizes reimbursement grants for what may be analyzed as two categories of projects. In the first category are projects previously awarded grant assistance under the former FWPCA, and thereby received previously-required Federal approval, and projects which, while not awarded grant assistance under the former FWPCA, nevertheless were submitted for Federal approval, in order to assure compliance with applicable Federal requirements and to better assure future eligibility for Federal reimbursement; in both cases, projects were reviewed to determine compliance with then-applicable Federal requirements. In the second category are projects which have received no grant assistance under the former FWPCA and were not submitted for review with respect to Federal requirements prior to application for assistance under Sec. 206 of the 1972 FWPCA Amendments.

You have requested us to advise you as to the Federal statutory requirements applicable to the award of assistance to these projects, particularly with reference to the second category mentioned above and the requirement of Sec. 206 that the project must be determined to meet "the requirements of section 8 of this Act in effect at the time of the initiation of construction." We are herewith furnishing our analysis of what we believe to be the applicable Federal requirements as follows: (1) the requirements of Section 8 of the former FWPCA; (2) other requirements of the 1972 FWPCA Amendments; and (3) other Federal requirements.

(A) *Requirements of Section 8*

Section 206(a) authorizes reimbursement assistance for each project

> ". . . on which construction was initiated after June 30, 1966, but before July 1, 1972, which was approved by the appropriate State water pollution control agency and which the Administrator finds meets the requirements of section 8 of this Act in effect at the time of the initiation of construction . . . ."

For your convenient reference, there is reproduced as an attachment to this memorandum, those statutory provisions which were in effect after June 30, 1966, and before July 1, 1972, except for the several technical amendments which extended the authorization provision of section 8(d) beyond June 30, 1971, pending enactment of the 1972 FWPCA Amendments (P.L. 92-500).

In summary, we have found that there are no differences during this period in the substantive provisions of Section 8 which are relevant to Sec. 206 project review. These requirements are discussed in some detail below.

We have also noted, at p. 33 of the Senate Report which accompanied S. 2770 (S. Rep. 92-414, 92d Cong., 1st Sess.) the statement of intent that EPA must determine that each project for which assistance is requested under Sec. 206 ". . . was designed and constructed in accordance with the requirements of the Act, *and regulations thereunder*, in effect at the time that construction was initiated." (emphasis added). We believe that the prior regulations are applicable, to the extent that they reflect an interpretation of statutory requirements which are otherwise applicable for the purposes of Sec. 206 review. We do not believe that additional administrative requirements set forth in prior regulations must be made applicable-- for example, the industrial cost recovery requirement that related to the non Federal share of project costs, which was published at 35 F.R. 10757 on July 2, 1970, and codified at 18 CFR Sec. 601.34 (January 1, 1971 ed.). Inasmuch as the Section 8 regulations published on June 9, 1972, at 37 F.R. 11650, and codified at 40 CFR Secs. 35.800 *et seq.* (July 1, 1973 ed.) constituted principally a recodification of the Sec. 8 regulations occasioned by the transfer of the regulations from Title 18 to Title 40 of the Code of Federal Regulations, we would suggest that these regulations be utilized to the extent relevant for Sec. 206 project review.

1. *Section 8(b)(1)(first phrase)*: requires that the project must have been approved by the appropriate State water pollution control agency. This provision must be met for all reimbursement grants. We suggest that this requirement be met through certification by the state agency if a copy of the state agency approval cannot be furnished by the applicant. The requirement for prior Federal approval is overriden by Sec. 206, which authorizes reimbursement for projects for which prior Federal approval of assistance has not been obtained.

2. *Section 8(b)(1)(second phrase)*: requires the project to be included in any "comprehensive program" developed pursuant to Section 3(a) of the Act. This does

not refer to "comprehensive plans" under Section 3(c) (support for this can be found not only in the semantics of Section 8, but by reference to Sections 2 and 6(b)(2) of P.L. 660, July 9, 1956, which set forth the identical requirement before Section 3(c) was added by amendment). Similarly, the provision does *not* refer to State programs developed pursuant to Section 7 of the Act, which are addressed in Section 8(b)(1)(5), discussed below. Very little of the planning contemplated by the subject provision was completed. Compliance with this requirement can be effected by relatively simple intra-agency review to determine whether the project is consistent with Sec. 3(a) program requirements, if any, in effect at the time of project initiation.

3. *Section 8(b)(1)(2)*: sets forth the former basic 30% Federal participation limitation. This has no bearing on Sec. 206 project review of reimbursement grant applications, since Sec. 206 authorizes a higher level of Federal assistance (50/55%).

4. *Section 8(b)(1)(3)*: requires each grantee to agree to pay the non-Federal share of the project. We suggest that this requirement can be met either by a statement from the applicant, or other adequate evidence of payment of project costs, in cases where construction has been completed. If construction has not been completed, payment may not be made for the incomplete work pursuant to Sec. 206, and the grantee need only demonstrate that it has made adequate provision to pay its remaining costs.

5. *Section 8(b)(1)(4)*: requires that the grantee make ". . . provision satisfactory to the [Administrator, EPA] for assuring proper and efficient operation and maintenance of the treatment works . . ." after its completion. For both completed and uncompleted projects, the Agency must assure provision by the grantee of proper operation and maintenance. One means of accomplishing this would be by means of State assurance that it has found appropriate provision has been made for O&M by the grantee.

6. *Section 8(b)(1)(5)*: requires that the project be "in conformity with" the State water pollution control program submitted pursuant to Section 7 of the former FWPCA, and also requires that the project be ". . . certified by the appropriate State water pollution control agency as entitled to priority over other eligible projects . . . ." The former limitation may be met by a State assurance that the project was, at time of initiation of construction, not inconsistent with the State's Section 7 program. As regards the latter limitation, certification of priority for reimbursement projects would be meaningless and, in fact, violative of the intent of P.L. 93-207; therefore, EPA review need not consider this element.

7. *Section 8(b)(1)(6)*: sets forth the basis of increase in Federal participation to 40% of costs, and has no bearing on Sec. 206 project review of reimbursement grant applications, since Sec. 206 authorizes a higher level of Federal assistance (50/55%).

8. *Section 8(b)(1)(7)*: 50% eligibility (see 3 and 7 above). Note that the State's "agreement to pay" is not required for reimbursement under Section 206.

9. *Section 8(c)* (first sentence): requires the Administrator to determine for each project the public benefits to be derived therefrom; the propriety of Federal aid to the project; the cost-benefit factor; and the adequacy of provisions made by the grant applicant for proper and efficient post-construction operation and maintenance. Assurance from the State agency would provide a sufficient basis for compliance with this requirement (see also 5 above).

10. *Section 8(c)* (remainder): concerns allotment formulae, reallotment procedures, and reimbursement under Section 8. This provision has no bearing on project review of reimbursement grant applications under Sec. 206.

11. *Section 8(d)*: an authorization of appropriations, having no bearing on project review.

12. *Section 8(e)*: this provision contains a definition of construction which has been carried forward verbatim into 40 CFR 35.860. This definition of construction is applicable to all reimbursement projects under Section 206(a). We are aware that Section 212(1) of the Amendments contains a much broader definition of construction which, according to that section, is for application to all Title II. This provision was so interpreted in floor comments of former Congresswoman Bella Abzug (see *A Legislative History of the Water Pollution Control Act Amendments of 1972*, 93d Cong., 1st Sess., No. 93-1, p. 372 (hereinafter "Legislative History"). Nevertheless, we believe that the definition of construction contained in Section 8 is controlling. In principles of statutory construction, the specific provision takes preference over the general; Section 206(a) specifically directs one to Section 8 of the Act. Section 212(1) clearly was designed for different purposes, namely, for correlation with the "segmented" construction approach Congress promoted (see *Legislative History*, p. 294). Legislative history of the Act indicates that Section 206 was intended to be remedial in nature, to correct the inequality which was found between projects funded on different bases. All projects during the period in question—6/30/66-7/1/72 - were guided by the definition of construction in Section 8, and a gross broadening of the scope of reimbursement projects—which would result from adopting the new definition of construction—would appear to be markedly preferential rather than remedial. Neither the statute nor its legislative history indicates that Congress intended for reimbursement projects to suddenly obtain such status. In summary, we believe that the broader definition of construction in the 1972 FWPCA Amendments applies solely to new construction funded under Sec. 201 of the Act, and that the former definition set forth in 40 CFR 35.860 and Section 8(e) of the prior FWPCA is applicable to Sec. 206 assistance.

13. *Section 8(f)*: sets forth the requirements for an increased grant for urban planning. Section 206(a) provides for reimbursement up to 55% of project costs ". . . where the Administrator also determines that such treatment works was constructed in conformity with a comprehensive metropolitan treatment plan as described in Section 8(f) . . . as in effect immediately prior to the date of enactment of the [Amendments] . . . ." As we understand it, arrangements presently exist (including cooperative arrangements with HUD) which will facilitate review for this increased benefit. The same procedures should be observed as have been followed under Section 8.

14. *Section 8(g)*: Davis-Bacon Act requirements. Provides that the Administrator shall ". . . take such action as may be necessary to insure that all laborers and mechanics employed by contractors or subcontractors on projects for which grants are made under this section . . ." shall be paid at least prevailing wage rates. The Secretary of Labor establishes the rates, pursuant to 40 USC 276a *et seq.*, the so-called Davis-Bacon Act. We are informed that the Department of Labor has advised the Agency informally that it will not be feasible to determine prevailing wage rates on "old" work. It appears clear that contracts (or subcontracts) awarded after the date of reimbursement grant award must conform to the requirements of the law. For earlier awards, the agency will generally be unable to determine the prevailing rate; even if the rate was determined, enforcing compliance with the rate would be difficult. We do not believe that this very practical inability to determine retrospective compliance with Section 8(g) should be permitted to slow the reimbursement program; neither do we believe that Congress intended such a result. A distinction may be drawn between the fundamental *purpose* of the Davis-Bacon Act—which case law holds to be protection of employees from substandard wages—and the *method* of achieving that purpose, which was to direct the Secretary of Labor to determine minimum wages for a project based on prevailing rates in the locality. It will generally be impossible to implement the Act's purpose by the Congressionally-selected method; we do not, however, believe this gives the agency authority to dismiss any attempt at achieving the purpose of the Act. We believe that wherever possible, the agency should seek to obtain available evidence regarding whether the grantee's contractors paid the same general level of wages to their employees as was paid to those similarly situated at the time. A written affirmation to that effect, obtained from the grantee and accompanying the grant application, would generally be sufficient to meet the purpose of the Act, given the unusual circumstances.

(B) *Other Requirements of the 1972 FWPCA Amendments*

There are several requirements in the 1972 FWPCA Amendments, as amended, which are applicable. We note, initially, however, that the requirements of Sec. 201(g) for the application of best practicable waste treatment technology, for the study of alternative waste management techniques, for the application of technology for the reclaiming or recycling of water or otherwise eliminate the discharge of pollutants, and for infiltration analysis, while applicable to assistance under Sec. 201, are not applicable to Sec. 206 grant assistance. The requirements of Section 204 are similarly inapplicable.

1. *Section 501(a)*: issuance of regulations. The regulations promulgated on January 29, 1974 (39 F.R. 3677) provide, at 40 CFR Sec. 35.865(b) that "The applicant must furnish such other information as may be required for determination of entitlement or quantum under this Subpart. This affords the basis for obtaining documentation or information required to be furnished.

2. *Section 501(c)*: grantee records. Pursuant to this provision, the grantee is obligated to maintain and furnish records adequate to establish eligibility and prove quantum with respect to a Sec. 206 claim for reimbursement. As an alternative to requiring copies of relevant documents (the construction contract, for example), it would be sufficient to require that the grantee make such records available upon audit; see 4. below.

3. *Section 501(d)*: maintenance of records for audit and examination by EPA or GAO. This pertains to the period of claims processing, and three years after final payment; see Article 2 of the EPA General Grant Conditions, Appendix A to Subchapter B of Title 40 of the Code of Federal Regulations.

4. *Section 3 of PL 93-207*: audit before final payment. This statutory provision permits interim payments to be made on Sec. 206 claims, but also requires, in conjunction with the Sec. 206 payment mechanism, that an audit be accomplished for each project prior to the final Sec. 206 payment.

5. *Section 2 of PL 93-207*: statutory limitations date for presentation of Sec. 206 claims. The grant file must contain or refer to adequate evidence of receipt of the Sec. 206 claim on or before January 31, 1974.

(C) *Other Federal Requirements*

In addition to the requirements of Section 8 and of the 1972 FWPCA Amendments, there are other requirements applicable to all grant awards, by virtue of other legislation and collateral requirements, such as Executive Orders. We have noted that Section 206(a) itself states only that the requirements of Section 8 must be met. However, neither this statement nor the legislative history of the Act provides any basis for construing Section 206(a) as waiving those other requirements which are applicable to Federal grant awards generally (such as the award authority under Section 201(g) or Section 208).

1. *NEPA*. Section 102 of NEPA (42 U.S.C. 4332) requires an environmental impact study of all ". . . major Federal actions significantly affecting the quality of the human environment . . ." However, Sec. 511(c)(1) of the 1972 FWPCA Amendments provides that "Except for the provision of Federal financial assistance for the purpose of assisting the construction of publicly owned treatment works as authorized by section 201 of this Act, . . . no action of the Administrator taken pursuant to this Act shall be deemed a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act of 1969 . . ." Accordingly, NEPA review is not required for reimbursement grants, which are awarded under the separate grant award authorization of Sec. 206 of the Act. We note that NEPA review, if it were required, would be impractical, since there generally are no alternative approaches which are feasible in the case of reimbursement projects the construction of which is either completed or substantially completed. Also, NEPA was enacted *after* initiation of construction of many of the Sec. 206 projects.

2. *Relocation Assistance*. The Uniform Relocation Assistance and Real Property Acquisition Policies Act of

1970 (42 U.S.C. 4621 *et seq.*) prohibits approval of any Federal assistance to any project until the Administrator determines that the policies of the Act will be met (see 40 CFR Part 4 for EPA regulations implementing the Act). The Act requires that certain benefits be made available to businesses and persons displaced by a project *after January 1, 1971*. Thus, even though a project may have begun in 1967, if persons or businesses were relocated after January 1, 1971, the benefits of the Act must be made available (if, on the other hand, dislocation occurred prior to January 1, 1971 on a project which is not yet complete, no benefits would be available). Implementation of the Act during the remaining periods of uncompleted projects should be accomplished by means of procedures presently used for relocations under construction grants. Implementation of the Act for relocations which occurred after January 1, 1971 without compliance with the Relocation Act, however, may prove troublesome. Reimbursement grantees must be notified of the requirements of the Act, and informed that compliance with the Act is a condition of the grant. One means of obtaining such compliance, where required, could be by requiring the grantee to take all reasonable steps to locate and inform potential relocation assistance recipients, including, where necessary, advertisement in newspapers of wide circulation in the area.

3. *The Civil Rights Act of 1964.* Title VI of the Civil Rights Act provides that no person shall, on the basis of race, color, or national origin ". . . be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." (Section 601, 42 USC 2000d). To effect this provision, all reimbursement project applications should be accompanied by the Compliance Report form (EPA Form No. 4700-4) developed by EPA's office of civil rights. This will generally be done quite routinely for ongoing projects; for completed projects, the form will develop information on discrimination in service area scope, which is the primary matter of concern. If discrimination is discovered, this office should be consulted as well as the Office of Civil Rights and Urban Affairs, prior to the taking of any action.

4. *E.O. 11246 (equal employment opportunity).* Section 301 of E.O. 11246 states in pertinent part as follows:

> "Each executive department and agency which administers a program involving Federal financial assistance shall require as a condition for the approval of any grant . . . which may involve a construction contract, that the applicant for Federal assistance undertake and agree to incorporate, or cause to be incorporated, into all construction contracts paid for in whole or in part with funds obtained from the Federal Government . . . or undertaken pursuant to any Federal program involving such grant . . . the provisions prescribed for Government contracts by Section 202 of this Order . . ."

The provisions of E.O. 11246 depend for their efficacy upon contractual implementation. The Order must be implemented for all contracts awarded after the date of award of a reimbursement grant (see EPA's regulations implementing the Order, 40 CFR Part 8). However, the agency need not require revision or modification of contracts which have been awarded prior to the date of grant award. The language of Section 301 of the Order clearly is susceptible of an interpretation which countenances prospective application only (as are the implementing regulations of the Department of Labor; see, e.g., 41 CFR 60-1.4(b)). We are informed by EPA's office of Civil Rights and Urban Affairs that this interpretation is concurred in by the Office of Federal Contract Compliance. In the event additional problems arise with regard to particular contracts under reimbursement grants, it should be noted that the Labor Department's regulations authorize the Director of the Office of Federal Contract Compliance to ". . . exempt any agency . . . from requiring the inclusion of any or all of the equal opportunity clause . . . when he deems that special circumstances in the national interest so require." 41 CFR 60-1.5(b).

5. *Historic preservation.* The National Historic Preservation Act of 1966 (16 USC 470 *et seq*) requires the agency, prior to grant award, to "take into account" the impact of the Federal assisted activity on historical sites and objects included in a National Register developed by the Department of the Interior. In addition, the agency must also afford the Advisory Council on Historic Preservation an opportunity to comment on the action. We believe that State review can provide information necessary for review of any situation in which uncompleted construction or site acquisition may affect an historical site. No useful purpose would be served by reviews of historical dislocations which have occurred prior to grant award.

6. *Clearinghouse review.* Section 204 of the Demonstration Cities and Metropolitan Development Act of 1966 (42 U.S.C. 3334) and the Intergovernmental Cooperation Act of 1968 (42 U.S.C. 4201 *et seq*), as implemented by OMB Circular A-95, require submission of Federal applications for grants for treatment works construction assistance to certain clearinghouses for review. The purpose of the review is to assure coordination of local, State and Federal planning, and as such the impact is totally prospective. Where construction of a project has already been initiated (as must be the case in order for a project to be eligible for a reimbursement grant) clearinghouse review would serve no useful purpose. It is our opinion, accordingly, that clearinghouse review is not required in the case of Sec. 206 grant awards, except in those cases where such review is required pursuant to State or local law.

7. *Flood insurance.* Section 102 of the Flood Disaster Protection Act of 1973 (P.L. 93-234) (FDPA) prohibits the approval after March 1, 1974 of any federal financial assistance for acquisition or construction in any flood hazard area in which flood insurance is then available unless the building or personal property to which such assistance relates is covered by flood insurance for its entire useful life, in an amount at least equal to its cost or the maximum limit of coverage available, whichever is less. "Financial assistance for acquisition or construction for acquisition or construction purposes" is defined in Sec. 3(a)(4) of this Act to include "any form of financial assistance which is in whole or in part for the acquisition, construction, . . . of any . . . building . . . and for any [personal property] . . . contained or to be contained therein . . . ." "[F]inancial assistance" is also defined to include any form of grant, payment or rebate. Sec. 3(a)(3). Accordingly, reimbursement under sec. 206 of

the 1972 FWPCA is included in the definition of financial assistance under the Flood Disaster Protection Act. Since the federal financial assistance is in the form of reimbursement of expenditures for acquisition and construction purposes, the FDPA is applicable.

Therefore, the following grant condition must be included in any grant awarded under Sec. 206:

> The grantee agrees to acquire and maintain any flood insurance made available to it under the National Flood Insurance Act of 1968, as amended, in an amount at least equal to the total eligible project costs or to the maximum limit of coverage made available under the National Flood Insurance Act of 1968, as amended, whichever is less for the entire useful life of the project. Provided that this condition shall not be applicable if, on the date of grant award, flood insurance was not available pursuant to the Flood Insurance Act of 1968, as amended, for property in the project location or if the property is covered under State policy of self-insurance approved under such Act.

If Sec. 206 grant agreements have already been approved (after March 1, 1974) without this condition, no further grant payment may be made until such condition is incorporated by grant amendment or amendment of the Sec. 206 regulations, or both. Determination of compliance with this condition may be accomplished in conjunction with the Sec. 206 audit.

8. *Copeland Act.* A portion of the Copeland Act relates to "kickbacks" from public works employees, the inducement of which can have criminal consequences, 18 U.S.C. 874. The remaining provisions of the Act require contractors and subcontractors to submit weekly statements of wages paid to employees, 40 U.S.C. 276c. The statute, and its implementing regulations (29 CFR 3.1 *et seq.*) are designed to aid in enforcement of the minimum wage provisions of the Davis-Bacon (see discussion under A-14 above). Generally, 40 U.S.C. 276c will be implementable only for contracts and subcontracts awarded after the date of reimbursement grant award.

CONCLUSION

The foregoing requirements constitute all of the Federal requirements which are applicable, in our opinion, to the award and administration of the Sec. 206 reimbursement grant awards in the second category first mentioned in this memorandum. You should note that the requirements mentioned in Parts (B) and (C), above, are also applicable to the first category of grants, i.e., those where there has been a prior grant award or Federal approval. For example, if a Sec. 8 grant was awarded in 1968 for a project, the Relocation Act procedures would not then have been applicable, since that statute had not yet been enacted; however, the award of Sec. 206 assistance at this time constitutes a Federal action which has the effect of making the Relocation Act applicable to relocations effected after January 1, 1971, even though the Relocation Act had not previously applied to the project. The procedures discussed above would be applicable, but we would expect that such instances would be infrequent.

We would call to your attention, with respect to Sec. 206 award and payment procedures, the following provisions of Sec. 3 of Public Law 93-207 (emphasis added):

> "• • • Notwithstanding the provisions of subsection (d) of such section 206, (1) the Administrator is authorized to make interim *payments* to each such project for which an application has been approved on the basis of estimates of maximum pro rata entitlement of all applicants under section 206(a) . . . . *Upon completion* by the Administrator of his audit and approval of *all* projects for which an application has been filed under subsection (a) of such Section 206, the administrator shall, within the limits of appropriated funds, allocate to each such qualified project the amount remaining, if any, of its total entitlement.
>
> • • • In no event, however, shall any payments exceed the Federal share of the cost of construction incurred to the date of the voucher covering such payment plus the Federal share of the value of the materials which have been stockpiled in the vicinity of such construction in conformity to plans and specifications for the project."

In the accompanying November 29, 1973 House Report (No. 93-680), there is the following additional comment (emphasis added):

> • • • It has become evident that many eligible recipients would be forced to incur expenses and delays in new projects or risk failure to projects under construction if payments were made only after complete review and determination on all applications. The large number of applications for reimbursement *will require extensive processing* by the Environmental Protection Agency *before full payment* on each can be made. Section 3 of the legislation authorizes preliminary interim reimbursement of funds to projects *which can be easily approved on the basis of available documentation* pending final processing of all projects. This would include *nearly all projects for which there has been any Federal financial assistance in the past,* from the Environmental Protection Agency or other source. This will prevent undue disruption in community plans and also facilitate an orderly cash flow by the United States Government. It is expected that the Environmental Protection Agency will immediately implement the interim payment provisions of this section."

We are aware that EPA is under considerable pressure from Congress, state agencies, and eligible municipalities to expedite Sec. 206 payments. While the agency has no discretion concerning the applicability of Federal requirements discussed in this memorandum, it may be possible to ease the administrative burden of such requirements upon grantees and this agency. We will be pleased to assist in developing alternative procedures, if any are suggested, to facilitate compliance with applicable Federal requirements. In order to accomplish the purposes of Sec. 101(i) of the 1972 FWPCA Amendments, which emphasize a national policy of "drastic minimization of paperwork," we recommend that emphasis should be placed upon record retention by grantees and examination of grantee records upon audit, rather than requiring the submission of copies of docu-

ments (such as entire construction contracts), unless such submissions are absolutely required to determine eligibility or *quantum* questions. It may be necessary to defer payment upon projects in the second category until completion of an audit, unless entitlement and *quantum* are adequately demonstrated by the grantee.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

MAY 25 1976

OFFICE OF
RESEARCH AND DEVELOPMENT

Mr. Stephen J. Sebesta
Sanitary Engineer
County of Cuyahoga
1276 West 3rd Street
Cleveland, Ohio 44113

Dear Steve:

Thank you for your letter of May 3, 1976 following up on our discussions in St. Louis concerning the problem associated with the Rocky River Wastewater Treatment Plant Demonstration Project.

Examination of the extent of Federal participation in the project indicates that the original grant awarded in 1968 amounted to $746,360 [redacted] project. [redacted]

A [redacted] that vouchers have been submitted [redacted] Thus, [redacted] Of this [redacted] cost and [redacted] of the project.

I find that the Federal investment in the project constitutes one of the largest research and development demonstration projects ever awarded in our program and, in view of our current budget limitations and our substantial commitment in the past, we cannot make any further funding commitments from research and development funds.

In addition, our Municipal Environmental Research Laboratory in Cincinnati has investigated the possibility of construction grant participation to further assist this account. As you thought, it is not possible to obtain additional funding through the Construction Grants Program to contribute to the cost of facilities already in place. The County can, however, legitimately apply for a construction grant for improvement of the sludge facilities. The Regional Office informs

us that no application for such improvement is in hand. If I recall correctly, you indicated such an application was being prepared.

We are extremely interested in the success of this demonstration project and strongly desire that the information originally planned for be forthcoming from the studies now underway. We assure you that we wish to work closely with the County by providing technical assistance which will assist you in solving the operational and other technical problems associated with the project. Toward this end we will be pleased to meet with you at your convenience to determine a course of action. I recommend that you contact the Project Officer, Mr. James Westrick, and make arrangements for a meeting at an early date. His phone number is: Area Code 513 684-7652. Mr. Convery, Director, Wastewater Research Division, Municipal Environmental Research Laboratory, has assured me that assistance will be provided toward solving your operational problems.

Sincerely,

Robert W. Schaffer
Associate Deputy Assistant
Administrator for Air, Land & Water Use

RESOLUTION

Directing the County Administrator and the County Sanitary Engineer to file an application with the Federal Environmental Protection Agency seeking a reimbursement grant for construction costs of the Rocky River Wastewater Treatment Plant as soon as House Bill No. 9560 or any similar legislation is enacted by the Congress.

- -

BE IT RESOLVED by the Board of County Commissioners of Cuyahoga County, Ohio, that the County Administrator and the County Sanitary Engineer be, and they are, hereby directed to file an application with the Federal Environmental Protection Agency seeking a reimbursement grant for construction costs of the Rocky River Wastewater Treatment Plant as soon as House Bill No. 9560 or any similar legislation is enacted by the Congress, it being the intent of this Board that any such grant received shall be applied as then agreed upon between the Board of County Commissioners and the Cities of Bay Village, Rocky River, Fairview Park and Westlake, and in the absence of agreement shall be deposited in a sinking fund to reduce the costs to those cities of repaying the bonds which were issued in June, 1976, to cover the cost of construction of such plant.

BE IT FURTHER RESOLVED that the Clerk of the Board be, and she is, hereby instructed to transmit a copy of this resolution to the following persons:

William S. Gaskill, County Administrator
Stephen J. Sebesta, County Sanitary Engineer

Mayor Henry P. Reese
City of Bay Village
350 Dover Center Road
Bay Village, Ohio 44140

Mayor Earl Martin
City of Rocky River
21012 Hillard Road
Rocky River, Ohio 44116

Mayor Joseph M. Gall
City of Fairview Park
20777 Lorain Road
Fairview Park, Ohio 44126

Mayor Alexander Roman
City of Westlake
27216 Hilliard Boulevard
Westlake, Ohio 44145

On Motion of Commissioner Taft, seconded by Commissioner Sweeney, the foregoing resolution was duly adopted.

Ayes: Taft, Sweeney, Corrigan.

Nays: None.

Resolution Adopted.

Louise M. Mulock,
Clerk of the Board.

Journal 171, Page_____
June 3, 1976.

CONTRACT NO. 1

(18) Sheet 3 of 4

Project No. EPA-11010 DAB Contract No. 14407 Change Order No. 1

Impr. No. 615-A

REQUEST AND JUSTIFICATION FOR CHANGE

1. Necessity for change: NEW ITEMS NO. 1A THROUGH 1F, INCLUSIVE:

After approval of design, construction plans and specifications of this improvement, the U.S. Environmental Protection Agency, who is sponsor of research and development grant for this project, conducted a series of studies at its pilot plant at Pomona, California, simulating the design and operation of the Rocky River Plant. The test results indicated clogging of the Carbon Columns, development of anaerobic conditions in them, which produced sulfide in its effluent and other operational difficulties as well as excessive pollution caused by the Carbon Regeneration Furnace. To rectify these conditions, which were not known at the time of design, the U.S. Environmental Protection Agency required the installation of additional equipment and made other modifications, which are included in this Change Order.

OTHER ITEMS OF EXTRA WORK:

Provide for items of extra work not originally contemplated but made necessary in the performance of the work and were unforeseen.

During progress of work, several unforeseen and unacceptable conditions were encountered that have to be corrected in order to insure good construction of the project.

ADDITIONAL QUANTITIES OF CONTRACT ITEMS:

Field measurements indicate that the amounts of several unit price items, as provided for in the original contract, are low and have to be increased and are necessary in the performance of the work.

(19)

OFFICE OF THE MAYOR
EARL MARTIN, MAYOR

September 16, 1976

Honorable

Dear Sir:

This letter is being written in an effort to point out what we believe to be an injustice that was created in Public Law 92-500 and/or by the adoption of the EPA reimbursement grants eligibility requirements. The City of Rocky River, Fairview Park, Bay Village, and Westlake, Ohio, have entered into an agreement with commissioners of Cuyahoga County for the building and operation of primary and secondary waste water treatment plants. Our primary treatment plant was completed in the year 1960, and under requirements by Ohio Water Polution Control Board, we have now completed construction of an activated carbon pile secondary treatment system. This program originally began in 1966, as far as planning and design.

On August 17, 1970, the County of Cuyahoga awarded contracts to the Calgon Corporation for the building of said secondary treatment plant. This contract was subsequently voided by court action.

On January 27, 1972, Cuyahoga County again awarded a contract for the construction of a secondary water treatment plant. This contract was to the Spohn Corporation and this contract was also voided by court action.

On September 13, 1972, the U.S.-E.P.A. placed the County of Cuyahoga and the four cities which make up this sewer district on 180 days notice, to proceed with construction of said plant.

On October 2, 1972, the Spohn Corporation being the lowest and best bidder, was again awarded the construction contract.

And, on October 18, 1972, Public Law 92-500 was amended.

Inasmuch as the County, acting as agents for the cities involved, has only received a research and construction grant in the amount of $900,000 which is only 20% of the total project cost, and following the suggestion of the Federal E.P.A., the four cities have applied for reimbursement grants under Public Law 92-500. In Section 206 of Public Law 92-500, it reads as follows:

> Section 206.(a) Any public owned treatment works in a State on which construction was initiated after June 30, 1966, but before July 1, 1972, which was approved by the appropriate State water pollution control agency and which the Administrator finds, meets the requirements of Section 8 of this Act in effect, at the time of the initiation of construction shall be reimbursed a total amount of Federal financial assistance, if any received under such Section 8 for such project and 50 per centum of the cost of such project, or 55 per centum of the project cost where the Administration also determines that such treatment works was constructed in conformaty with a comprehensive metropolitan treatment plan as described in Section 8 (f) of the Federal Water Pollution Control Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. Nothing in this subsection shall result in any such works receiving Federal Grants from all sources in excess of 80 per centum of the cost of such project.

Section 212, as used in this title describes the definition of the term construction as follows:

> Section 212. As used in this title -
> (1) The term 'construction' means any one or more of the following: Preliminary planning to determine the feasibility of treatment works, engineering, architectural, legal, fiscal, or economic investigation or studies, surveys, designs, plans, working drawings, specifications, procedures or other necessary actions, erection, building, acquisition, alteration, remodeling, improvement, or extention of treatment works, or the inspection or supervision of any of the foregoing items.

It would seem that under Public Law 92-500, we are clearly eligable for reimbursement grants, however, the EPA requirements define the word 'construction' in the phrase initiation of construction and in their definition 35.890:

> The phrase "initiation of construction" as used in this subpart, means the issuance to a construction contractor of a notice to proceed, or, if no such notice is required, the execution of a construction contract.

Our problem now seems to be that we are not eligable for either construction grants or reimbursement grants. All waste treatment plants whose initiation of construction took place between July 1, 1972 and October 18, 1972, seem to be ineligable for either reimbursement or construction grants. I can not believe that the Senate or the House of Representatives had intended this to be the situation, while some of our neighbors are receiving grants from 55 to 75%, we seem to be locked in with less than 20% research grant.

H. R. 9560 passed the House by a vote of 339 - 5 which included the reimbursement provisions of Section 8 intact. The Senate Bill S-2710 has no reimbursement provisions.

It is of the greatest importance to the Cities of Rocky River, Fairview Park, Bay Village and Westlake, Ohio, along with some other cities in the United States, that Section 8, as passed by the House, be included in the final Bill S-2710.

We have moved forward in good faith under order from the Federal Government and now our Citizens have been penalized through a complete injustice in the reimbursement provisions of Public Law 92-500.

After four years of trying to solve this problem, we are still seeking relief from what I believe was a legislative error in 1972.

Very truly yours,

Earl Martin, Mayor
City of Rocky River

RE: Rocky River Wastewater Treatment
Plant Improvements 1970-1975

Dear Ms. Smith:

It was good to speak with you at the Ohio Municipal League meeting on August 20th of this year concerning matters of mutual interest particularly in the Cuyahoga County area.

You will recall that the County is presently involved in upgrading the Rocky River Wastewater Treatment Plant and has a Step III application being considered currently by the EPA. Further, the cities which comprise the drainage area to the plant have united in a law suit against the County, the Ohio and USEPA and the design engineer for recovery of five and a half million dollars resulting from the construction of secondary treatment facilities in the early 70's. This results in a real substantial financial exposure and needless to say, the County is exploring all avenues of relief and particularly the responsibilities of the parties to the arrangements which resulted in that construction.

In this connection I would like to outline in a brief synopsis some of the events which took place, particularly as to how they related to the grant situation.

A. October 1965 - The Ohio Water Pollution Control Board ordered the County to submit plans for improving the primary treatment plant.

B. August 18, 1966 - The Board of County Commissioners of Cuyahoga County approved an agreement with Willard E. Schade & Associates for engineering services for the enlargement and improvement of the Rocky River Wastewater Treatment Plant.

25 Public Square Cleveland Ohio 44113 216/623-7601

NTY OF
AHOGA

C. January 19, 1967 - The Department of Health of the State of Ohio approved the general plans for the plant improvements to be submitted to the Federal Water Pollution Control Administration.

D. December 27, 1967 - The Cuyahoga County Sanitary Engineer applied for a research development grant to the Federal Water Pollution Control Administration for the purpose of installing secondary wastewater treatment facilities utilizing a process of chemical clarification and granular activated carbon filtration and adsorption.

E. July 22, 1968 - Letter from the Federal Water Pollution Control Administration informed the County of the award of a $741,350.00 research and development grant based on estimated eligible project costs of $2,573,010 which was accepted by the Board of County Commissioners.

F. June 3, 1969 - The Department of Health of the State of Ohio approved the revised detailed plans for the activated carbon process.

G. September 22, 1969 - The County was in contact with A.M. Masse, Acting Chief of Municipal Treatment Research Program of the Advance Waste Treatment Research Laboratory in respect to the Federal Government not guaranteeing carbon column lining unless rubber was used. Further correspondence and recommendation was held with Mr. Masse in relation to the design of the air difusers and other items in the carbon columns.

H. January 29, 1970 - The Board of County Commissioners of Cuyahoga County resolved to proceed with the construction of the plant.

I. May 21, 1970 - The Clerk of the Board was directed to advertise for bids for the construction of the plant improvements.

J. June 11, 1970 - Bids received.

K. July 9, 1970 - EPA founded by Congress as an independent agency.

L. July 13, 1970 - A letter from A.M. Masse, USEPA authorizing the County to proceed with the awards of the contracts involved with the construction of the Plant Improvements.

M. August 11, 1970 - A single contract was awarded for the entire project which award was later voided by court action.

N. August 17, 1970 - The Board reopened the bids and awarded individual contracts to four different contractors which was voided by court action.

O. March 3, 1971 - The USEPA advised the County that an application for supplemental funding in the amount of $250,000.00 or 38.52 percent of the revised total eligible cost of $2,573,010.00 was approved of a total [illegible] cost of $[illegible] 777,447.00

NTY OF
AHOGA

P. August 6, 1971 - Total cost, both eligible and non-eligible of the project was revised upwardly to $4,879,630.00 resulting from the specs change.

Q. September 16, 1971 - The Board advertised for construction bids on the revised plans and specs.

R. November 4, 1971 - Bids received.

S. December 23, 1971 - The Board of County Commissioners recommended award of Contract I, II, III, IV and V.

T. January 20, 1972 - The USEPA approved the contracts as recommended by the Board.

U. January 22, 1972 - The Contract No 1 was awarded to Spohn Corporation which was later voided by court action on March 3, 1972.

V. January 27, 1972 - Contracts II, III, IV and V were awarded. Specs for Contract No I was readvertised and bids received Sept 14th.

W. Setember 18, 1972 - The USEPA placed the County of Cuyahoga and the four tributary cities on 180 days notice to proceed with the construction of the plant.

X. October 2, 1972 - Contract I was awarded to Spohn Corporation.

Y. October 18, 1972 - Public Law 92-500 was enacted.

Z. October 15, 1973 - The Board of County Commissioners of Cuyahoga County instructed the Sanitary Engineer to make application for reimbursement grant, as provided for in the Federal Water Pollution Act amendment of 1972 for the Rocky River Wastewater Treatment Plant in the amount of $1,432,520.00, which was 55% of eligible costs . No formal action was ever received on this grant application.

There are three main issues involved in the problems between the four tributary cities and the County relating to the construction of the carbon column treatment facilities.

The first issue relates to the fact that the carbon columns are inoperative and have not functioned in this particular circumstance. For this reason the cities are stating, that they should not be required to pay for something which was inoperative. As you will note from the brief synopsis, the Federal Government was actively involved in the R & D grant and in the actual design and selection of the carbon column process as secondary treatment. We feel that some responsibility attaches to the Federal Government because of its active involvement at the time the system was selected and designed prior to actual construction.

Secondly, you will note that the original R & D grant was obtained and the work commenced under the Water Pollution Control Act and apparently met the criteria of the R & D project fundable to the extent that money for the purpose

was available. The question which immediately arises is whether or not the existance of the R & D grant prior to the enactment of P.L. 92-500 will automatically preclude reimbursement under Section 201 of the Act.

The third issue is whether the construction date, as the word "construction" or "initiation of construction" as defined under EPA 40 CFR, Part 35 (Federal Register, Vol. 38, No. 122 Tuesday June 26, 1973) was within the time frame limitations required by the said regulations. The regulations state:

> "The proposed regulations would require that eligibility for reimbursement be limited to those State approved public sewage treatment works projects on which construction was initiated after June 30 1966 but before July 1, 1972 provided further that such projects are found to meet the requirements of Sect. 8 of P.L. 84-660 as amended. Application for reimbursement of eligible cost shall be made in writing and must be received by the appropriate Regional Administrator prior to October 18, 1973. the proposed regulations give priority for initial allocations from funds available under Public Law 92-399 to those projects which meet the time limitations noted above, and which (1) were certified or endorsed by appropriate State agencies, (2) were approved for reimbursement under Public Law 84-660, and (3) did not receive the full amount for which they were eligible under Public Law 84-660. Funds remaining after the first allocation will be made available to those State approved projects which received prior to Oct. 18, 1972, a qualifying State matching grant, retroactive from the federally approved effective date of State matching grant program. Should funds remain after the second allocation, a third allocation is provided for all other projects under construction during the 1966-72 period and receiving less than 50/55 percent Federal Grants. In terms of defining the word construction, Section 35.890 of EPA 40 CFR Part 35 defines the word "construction" as, "The phrase 'Initiation of construction', as used in this subpart, means the issuance to a construction contractor of a notice to proceed, or, if no such notice is required, the execution of a construction contract".

It appears that the County had awarded Contracts, that the design was completed, and that all of the administrative steps had been taken to proceed with the actual construction. Therefore, the requirements for initiation of construction had taken place.

Also, the reimbursement grant regulations were amended to extend the time for making such an application to the deadline date of October 18, 1973. The application was dated October 12, 1973 and was no doubt placed before the USEPA prior to the deadline date. As can be noted readily, the County did follow through with the construction contract as awarded and continued the project through to completion.

During the period following October 18, 1972, the amount of eligible funding increased immediately to 55% of the total project cost, with further increases to 75% and to 85% for innovative alternatives which accurately describes the Rocky River project.

NTY OF
AHOGA

[redacted] project [redacted].

[redacted].

Assuming a grant eligibility of a minimun of 55% of the project cost, the funding which should be available is $2,834,150. The balance remaining between the funding the County should have received and the amount actually received is $1,842,800.00. If the funding is found to be 75% which should be made available to the County then the amount in question is $2,873,465.00 in addition to the grant received.

In this regard we are requesting your assistance and support in rectifying this undeserved financial burden that has been placed on the County and the contributing cities. We would be glad to visit your office to review the matter in greater detail at your earliest convenience.

Yours very truly,

John J. Garner
Sanitary Engineer

Valdas V. Adamkus, Administrator
U.S. EPA - Region V
230 South Dearborn
Chicago, Illinois 60604

Dear Mr. Adamkus:

First, I would like to congratulate you on your nomination as Region V Administrator. Your considerable experience in this Region should provide you with a successful tenure in office. I would also like to express my appreciation to your staff for the excellent cooperation we received in obtaining a Step III Construction Grant for the improvements to the Rocky River Wastewater Treatment Plant. Over the years I have found your staff to be very cooperative and understanding in my previous professional employments with Summit County, the City of Cleveland, Three Rivers Watershed District and Lake County. I would be very disappointed if these successful relationships would not continue here in Cuyahoga County.

Again, best wished and thank you.

Very truly yours,

John J. Garner

Ms. Charlie Smith
U.S. Environmental Protection Agency
230 South Dearborn
Chicago, Illinois 60604

Dear Ms. Smith:

We appreciated the time that Messrs. Cayer, Poremba, Baker and Cull and you took from your very busy schedules to discuss with us the total Rocky River Wastewater Treatment Plant situation - past and present.

Although we do not pretend to be experts in the area of federal legislation and USEPA regulation development, construction and interpretation we respectfully offer for your favorable further consideration the following:

1. It would appear that the general intent of Congress in enacting P.L. 92-500 on October 18, 1972 and P.L. 95-217 on December 27, 1977 was to develop and implement a general 75% water pollution control construction program. In doing so Congress recognized that significant water pollution control construction had occurred prior to the enactment of P.L. 92-500.

   In order to compensate local governmental units for proceeding with such construction P.L. 92-500 Sec. 206 provided for reimbursement of 50 or 55% of project costs for..."publicly owned treatment works in a State on which construction was initiated after June 30, 1966, but before July 1, 1972...".

   The amount of reimbursement would be the difference between the amount received "<u>if any</u>" under Sec. 8 of the Act in effect and 50% or 55%. A maximum federal grant "<u>from all sources</u>" could not exceed 80%.

2. There does not appear to be any language in this section that would preclude a R/D grant project from receiving additional grant monies - to the contrary it would appear that Sec. 206 would encourage such reimbursement.

Cont'd.

COUNTY OF
CUYAHOGA

If it is felt that the Rocky River activated carbon process did not meet the requirements of Sec. 8 we would appreciate being advised of the requirements that were not met.

3. Sec. 212 of P.L. 92-500 does provide a broad definition of "construction" from preliminary planning through actual construction. The term "initiation of construction" is not specifically defined in Title II of P.L. 92-500.

   We respectfully suggest that the use of the word "initiation" in Sec. 206 therefore means starting of any of the activities ennumerated in the definition of "construction".

   The Rocky River activated carbon process therefore had initiated construction prior to July 1, 1972. In fact 4 of the 5 construction contracts had actually been successfully awarded.

4. Congress evidently recognized that the July 1, 1972 cut-off date in P.L. 92-500 still did not entirely provide adequate reimbursement. Perhaps this recognition involved the July 1, 1972 date vs. the actual enactment date of October 18, 1972. Perhaps Congress had thought that P.L. 92-500 was going to be enacted six months or so prior to the July 1, 1972 date so that there would be a reasonable time period for projects to qualify for reimbursement vs. becoming involved in the Sec. 201 construction grants program.

   In any case Congress enacted P.L. 95-217 on December 27, 1977. Sec. 29 of P.L. 95-217 amended Sec. 206 of the Federal Water Pollution Control Act by extending the July 1, 1972 date to July 1, 1973. This would appear to be the only substantive change affecting the Rocky River Plant situation.

   If there is some written Congressional Committee Report, for example, that would indicate our non-legal interpretation of P.L. 95-217 is in error we would appreciate receiving a copy of it.

5. Recognition should be made of the fact that local governmental units and their consultants placed great reliance on the technical expertise, recommendation and advice of the Federal Water Pollution Control Agency staff in the art of designing an activated carbon treatment process. Detailed knowledge on this process in the late 1960's and early 1970's was limited to federal research, pilot plant studies and whatever knowledge could be obtained from limited plant experiences such as Lake Tahoe.

   It is extremely doubtful if the Rocky River activated carbon process would have been implemented if the federal government had not strongly encouraged, endorsed and assured the County that the process, as designed, would be successful.

cont'd.

COUNTY OF
CUYAHOGA

Unfortunately the process was not successful.

Presumably the art of design of the activated carbon process was significantly advanced by this expensive failure.

However, the fact that the process did fail, despite the federal government's assurances to the contrary, and the fact that the taxpayers involved with the Rocky River Plant will have to pay for another, significantly more costly, secondary treatment plant should encourage the federal government to provide additional compensation, beyond the less than one million dollars R/D grant that had previously been extended on the approximate five million dollar project, including interest during construction.

6. Mayor Earl Martin of Rocky River strongly stated at the meeting the pragmatic question "What elected official (Mayor or County Commissioner) would have proceeded with a 20-50% R/D grant project when he knew a 75% construction grant program was imminent, unless he had been assured that the project would eventually be reimbursed the additional monies?"

   At the time an enforcement action meeting was held in the USEPA's Lake Erie Office, prior to the enactment of P.L. 92-500, Mayor Martin obviously feels that such reimbursement assurance was given to the local officials by the federal officials present.

   Although I was not privileged to be Cuyahoga County's Sanitary Engineer at that time, nor was I involved with that meeting, I do know some of the elected officials who were involved and I can only agree with Mayor Martin's thesis.

7. We ~~are sincerely very appreciative of the excellent~~ cooperation ~~that USEPA has showed in offering Cuyahoga County~~ and ~~the four municipalities involved (Bay Village,~~ Fairview Park, ~~Rocky River and Westlake) the 75% grant in the approximate amount of 27.4 million dollars for the present project.~~

   We also hope that USEPA, considering all of the aspects of the Rocky River Plant situation - including the very significant net energy savings of approximately 21% when compared to the non-innovative alternative, and of approximately 34% when compared to conventionally operated trickling filters, can see fit to also offer to the County the additional 10% grant (for a total of 85%) for the present project as provided for eligible I/A projects.

Again, we do appreciate the past interest and cooperation that has been extended to the Rocky River Treatment Plant and the courtesies that were extended to us at our discussion of November 4, 1981.

Cont'd.

COUNTY OF
CUYAHOGA

We hope that your discussion of the total Rocky River Plant situation with the Regional Administrator will result in the additional reimbursement and I/A grant consideration that we feel the unique history of the plant merits.

Thanks again.

Very truly yours,

John J. Garner

November 23, 1981

Mr. Val Adamkus
U.S. EPA - Region V
230 South Dearborn
Chicago, Illinois 60604

Dear Mr. Adamkus:

As you are undoubtedly aware the Cuyahoga County Board of County Commissioners and the Mayors of Bay Village, Fairview Park, Rocky River and Westlake are again requesting reimbursement for the mid-1970 improvements constructed at the Rocky River Wastewater Treatment Plant.

In reviewing the history of this project and the history of pertinent Congressional Legislation, namely P.L. 92-500 enacted on October 18, 1972 and P.L. 95-217 enacted on December 27, 1977, I feel that their request for reconsideration of their previous reimbursement request is well-founded and should merit your favorable consideration.

If for some reason, this project did not qualify for reimbursement under P.L. 92-500's July 1, 1972 "initiation of construction" date, it should certainly qualify under P.L. 95-217's July 1, 1973 date. Four of the five construction contracts had been awarded on January 27, 1972, and the fifth construction contract had been awarded on October 2, 1972.

The intent of P.L. 92-500 and P.L. 95-217 in part, was to provide reimbursement for federally assisted projects such as this research and development project. Certainly it was not the Congressional intent to discriminate against such a project.

This project should have particularly merited such reimbursement because its activated carbon process was unsuccessful despite the federal government's assurances that the proposed process would work. Now these communities are forced to pay even more for a conventional biological secondary treatment plant at today's considerably higher costs, even with the assistance of a 75% construction grant.

It should be noted that the County and the four communities were unsuccessful in the mid-1970's in their attempts to recover additional operational costs, even though Congressional legislation was specifically intended to assist this project.

I earnestly urge your favorable consideration of this reimbursement request because of the project's unique history and its consistency with the general Congressional intent in enacting P.L. 92-500 and P.L. 95-217.

We would appreciate the opportunity to discuss this matter with you personally at your earliest convenience.

Sincerely,

DONALD M. MOTTL
Member of Congress

December 1, 1981

Mr. Richard Sullivan
Committee on Public Works
and Transportation
Room 2165, Rayburn Bldg.,
Washington, D.C. 20515

Re: Reimbursement for Rocky River

Dear Mr. Sullivan:

In accordance with your telephone conversation of November 30, 1981, with Congressman Ronald M. Mottl and myself, enclosed are [redacted] documents regarding Cuyahoga County's and the four communities' (Bay Village, Fairview Park, Rocky River and Westlake) attempt to receive reimbursement for the construction of improvements to the Rocky River Wastewater Treatment Plant that was initiated in 1972.

The enclosed documents include:

1. Section 206 of Public Law 92-500 - that provides for the reimbursement requested.

2. Section 212 of Public Law 92-500 that defines the term "construction". (It should be noted that Title II of P.L. 92-500 does not define the term "initiation of construction".)

3. Section 29 of Public Law 95-217 that extends the July 1, 1972 date of P.L. 92-500 to July 1, 1973.

4. Letter dated December 27, 1967 from George H. Eagle of the Ohio Department of Health to the U.S. Department of Interior.

5. Letter dated March 11, 1974 from Roger Strolow of U.S. EPA to U.S. Senator Robert Taft, Jr.

6. U.S. EPA internal memo dated March 28, 1974 from Joseph M. Zorc to John T. Rhett.

7. Letter dated September 16, 1976 from Rocky River Mayor Earl Martin that was sent to various members of Congress.

Cont'd.

COUNTY OF CUYAHOGA

8. Letter dated September 25, 1981 from the writer to Ms. Charlie Smith, U.S. EPA Region V. (This letter did not include consideration of P.L. 95-217.)

9. Letter dated November 20, 1981 from the writer to Ms. Charlie Smith of U.S. EPA.

10. Letter dated November 25, 1981 from Congressman Ronald M. Mottl to U.S. EPA Region V Administrator Val Adamkus.

U.S. EPA Region V's major present objection to granting the reimbursement requested is that a "Research and Development Grant" project does not meet the criteria of a "normal Section 8 construction grant" project because a R/D project involves new technology and a Section 8 project involves conventional technology.

In response I would suggest that the basic intent of a Section 8 project is to provide adequate treatment of a community's sanitary wastewater. The Rocky River WWTP activated carbon process was intended to provide secondary treatment of all of the sanitary sewage of the four communities served.

I seriously doubt that a Section 8 grant would have been denied to the activated carbon process if it had been applied for.

In the past U.S. EPA has also maintained that "initiation of construction" meant actually instructing a contractor to proceed with construction rather than initiating any of the activities provided in the definition of "construction" in Section 212 of P.L. 92-500.

We are requesting reimbursement for 55% of the normal eligible project costs of a project that had a total project cost of approximately five-million dollars. The R/D grant was slightly less than one-million dollars.

Your advice as to whether the "congressional intent" at the time of enactment of P.L. 92-500 and P.L. 95-217 was to exclude R/D grant projects from Section 206 (a) reimbursement would be appreciated.

Thank you for your consideration.

I will be very happy to discuss this with you at your earliest convenience.

Very truly yours,

John J. Garner

Dear Richard:

Enclosed is a letter and background from John J. Garner, our Sanitary Engineer for Cuyahoga County with regards to the matter we had talked to you about on Monday concerning the reimbursement to Cuyahoga County and four communities: Bay Village, Fairview Park, Rocky River and Westlake, all of which are in my congressional district. This reimbursement is for the construction of improvements to the Rocky River Wastewater Treatment Plant.

Mr. Garner and myself were very encouraged by our conversation with you. Anything you could do to help our cause would be extremely appreciated not only by myself but by all of the officials in the County and the above communities.

Would you be kind enough to get back to Mr. Garner and myself after you have had a chance to research this material and give us your thoughts on the legislative intent to bolster our argument that the County and four cities should be reimbursed.

Time is of the essence, so any and all help you could give is appreciated. Thank you in advance.

Sincerely,

RONALD M. MOTTL

Dear Mr. Adamkus:

I appreciated the time you took from your very busy schedule on November 30, 1981, to discuss with Congressman Ronald M. Mottl and myself the possible additional reimbursement for the Rocky River Wastewater Treatment Plant activated carbon process that was constructed by Cuyahoga County in the mid-70's.

It is our understanding that your staff is in the process of further researching the congressional intent regarding such reimbursement that resulted in certain language in U.S. Legislation - P.L. 92-500 and P.L. 95-217. In their research your staff may find it very productive to contact Mr. Richard Sullivan, Chief Counsel for the U.S. House of Representatives' Committee for Public Works. Mr. Sullivan can be reached at Room 2165, Rayburn Bldg., Washington, D.C. 20515 and telephone number Area Code 202-225-4472.

In our conversations Mr. Sullivan has displayed a great deal of personal knowledge in the area of congressional intent pertaining to this subject.

Thank you very much for your continued cooperation and interest in this matter.

Very truly yours,

John J. Garner

Dear Congressman Mottl:

On behalf of Cuyahoga County I would like to thank you for your outstanding assistance to us in our attempt to obtain reimbursement grant monies for the Rocky River Wastewater Treatment Plant's activated carbon process. Your success in clearly establishing the congressional intent of P.L. 92-500 and P.L. 92-217 regarding reimbursement for such research and development grant project on the floor of the House, as indicated in the Congressional Record, Vol. 127, No. 188, Part II, and our understanding of the content of the Conference Report on H.R. 4503, The Municipal Wastewater Treatment Construction Grant Amendments of 1981, is very much appreciated.

I would appreciate receiving a copy of the full Conference Report and a copy of the enacted legislation as those documents become available.

Also enclosed is a copy of a letter dated December 21, 1981 from the writer to the Ohio EPA Director, Wayne Nichols, pertaining to the referenced subject.

Your continued interest and cooperation in this reimbursement effort in our continuing relationship with the U.S. and Ohio EPA organizations will also be appreciated.

I have personally enjoyed very much working with you and your staff during the past few weeks in this successful effort.

Thanks again.

Very truly yours,

John J. Garner

RMM/km

Enclosures

STATEMENT OF REPRESENTATIVE RONALD M. MOTTL

BEFORE THE SUBCOMMITTEE ON HUD-INDEPENDENT AGENCIES

FEBRUARY 2, 1982

MR. CHAIRMAN, THANK YOU FOR THE OPPORTUNITY TO TESTIFY.

MY PURPOSE IN APPEARING BEFORE YOU TODAY IS TO EXPLAIN THE NEED FOR A GRANT TO THE ROCKY RIVER PROJECT IN CUYAHOGA COUNTY, OHIO, UNDER THE REIMBURSEMENT PROVISIONS OF THE FEDERAL WATER POLLUTION CONTROL ACT.

THE PROJECT AT ROCKY RIVER, WHICH ALSO SERVES THE COMMUNITIES OF BAY VILLAGE, WESTLAKE, AND FAIRVIEW PARK, WAS ORIGINALLY FUNDED IN 1968 UNDER THE RESEARCH AND DEVELOPMENT GRANT PROVISIONS OF THE FEDERAL WATER POLLUTION CONTROL ACT. THE PROJECT WAS TO USE AN ADVANCED SYSTEM OF CHEMICAL COAGULATION AND CARBON FILTRATION IN ORDER TO PROVIDE THE HIGH LEVEL OF TREATMENT REQUIRED FOR DISCHARGES INTO LAKE ERIE. CONSTRUCTION ON THE PLANT WAS INITIATED IN OCTOBER 1972.

AT THE TIME OF THE ORIGINAL GRANT AWARD, THE ACT PROVIDED FOR A 50% FEDERAL PARTICIPATION IN THE PROJECT COSTS OF SUCH DEMONSTRATION PROJECTS. IN FACT, THE GRANT, TOTALING $991,000, WAS ONLY 37% OF THE ELIGIBLE PROJECT COSTS, WHICH EXCEEDED $2.5 MILLION IN 1971.

IN 1972, CONGRESS AMENDED THE FEDERAL WATER POLLUTION CONTROL ACT. A SIGNIFICANT PART OF THOSE AMENDMENTS WAS TO INCREASE THE FEDERAL GRANT SHARE FOR PROJECTS TO 75%. AT THE SAME TIME, A REIMBURSEMENT PROVISION WAS ADDED WHICH ALLOWED FOR GRANTS

WHICH WERE TO BE USED TO INCREASE THE FEDERAL SHARE UP TO 50 OR 55% FOR THOSE PROJECTS THAT HAD RECEIVED LESS UNDER THE OLD LAW. IN 1977 THE REIMBURSEMENT SECTION WAS AMENDED TO EXTEND THE DEADLINE BY WHICH CONSTRUCTION MUST HAVE BEEN INITIATED FOR THE PROJECT SEEKING REIMBURSEMENT, TO JULY 1, 1972. CONSTRUCTION ON THE ROCKY RIVER PLANT WAS CLEARLY INITIATED WITHIN THAT DEADLINE.

MR. CHAIRMAN, I BELIEVE STRONGLY THAT THE ROCKY RIVER PROJECT SHOULD BE CONSIDERED FOR SUCH A GRANT. IT IS CLEAR TO ME THAT THE PURPOSE OF THE REIMBURSEMENT PROVISION WAS TO GIVE EQUITABLE TREATMENT TO PROJECTS WHICH WERE BEGUN UNDER THE OLD LAW BUT WHICH RECEIVED LESS EVEN THAN 50 OR 55% OF ELIGIBLE PROJECT COSTS. THIS IS PARTICULARLY TRUE IN VIEW OF THE FACT THAT THE FEDERAL SHARE WAS INCREASED TO 75% IN 1972. AND IT IS WORTH STRESSING THAT TODAY, INNOVATIVE PROJECTS, SUCH AS THE ORIGINAL ROCKY RIVER PLANT, ARE STRONGLY ENCOURAGED IN THE LAW AND ARE ELIGIBLE FOR FEDERAL GRANTS OF 85% OF ELIGIBLE COSTS.

THE COMMUNITIES SERVED BY THIS PROJECT HAVE BEEN SEEKING REIMBURSEMENT FOR MANY YEARS. THEY HAVE BEEN FRUSTRATED BECAUSE EPA CONTENDS THAT THE REIMBURSEMENT PROVISION SHOULD BE USED ONLY FOR "NORMAL" PROJECTS, NOT INNOVATIVE OR DEMONSTRATION PROJECTS. I BELIEVE THIS RUNS COUNTER TO THE STRONG CONGRESSIONAL AND STATUTORY PREFERENCE FOR INNOVATIVE PROJECTS. THIS PREFERENCE IS ESTABLISHED THROUGH A NUMBER OF PROVISIONS IN THE WATER ACT, INCLUDING THE CURRENT 85% FEDERAL SHARE FOR INNOVATIVE AND ALTERNATIVE PROJECTS. THIS PREFERENCE WAS RECENTLY REAFFIRMED AND STRENGTHENED BY THE 1981 AMENDMENTS TO THE CONSTRUCTION GRANTS PROGRAM, NOW PUBLIC LAW 97-117. AS CONGRESSMAN ROE SAID WHEN TAKING THE CONFERENCE REPORT ON THAT LEGISLATION TO THE FLOOR, THE ROCKY RIVER PROJECT "IS CERTAINLY THE TYPE OF PROJECT WHICH SHOULD BE ELIGIBLE UPON THE APPROPRIATION OF FUNDS." I URGE YOU TO CONSIDER ALLOWING FUNDS FOR REIMBURSEMENT OF THAT PROJECT IN THIS SUPPLEMENTAL APPROPRIATION FOR THE CONSTRUCTION GRANTS PROGRAM.

FACT SHEET
REIMBURSEMENT FOR ROCKY RIVER, OHIO
PROJECT UNDER SECTION 206(a) CLEAN WATER ACT

- Project at Rocky River, Ohio, also serves Bay Village, Westlake and Fairview Park:

- Project originally funded (1968) by a Research and Demonstration (R&D) grant under provisions of Section 6 Federal Water Pollution Control Act (FWPCA)

- Grant awarded to Board of County Commissioners, Cuyahoga Coungy on behalf of the four communities.

- Project includes chemical coagulation and carbon filtration due to high treatment required for discharge to Lake Erie.

- Original (R&D) funding level was $741,350 or 50 percent of estimated project cost.

- Cost subsequently increased to $2.5 million (March 1971). R&D grant could be increased to only $991,350 or 37 percent of estimated costs.

- Project cost probably now exceeds $2.5 million, but precise figure unavailable at this time. R&D grant remains at $991,350.

- Construction initiated in October 1972. PL 92-500 required construction to be initiated by June 30, 1972, to qualify for reimbursement under section 206(a).

- PL 95-217 (enacted 1977) extended period for reimbursement to June 30, 1973.

- Legislative history and regulations (40CFR 35.855-copy attached) limit reimbursement on projects initiated June 30, 1972-July 1, 1973 to those which received a grant under Section 8, FWPCA.

- See legal opinion prepared by Region V. (attached)

- Congressman Roe tells Congressman Mottl during floor debate on December 16, 1981, that Rocky River "is certainly the type of project which should be eligible upon appropriation of funds, and we shall certainly do all we can on behalf of the State of Ohio."

- EPA has agreed with Congressman Mottl to provide language for appropriation act that would allow reimbursement for Rocky River project.

- A PL 92-500 construction grant of $21.4 million was awarded September 1981, for modification and additions to this plant. These improvements retain essentially all of "R&D facilities" except carbon filters and building that houses them. (Carbon filters failed to perform adequately.)

Facts

On July 22, 1968, the Federal Water Pollution Control Administration (predecessor agency of the EPA) offered a "Research and Development" grant "under 33 U.S.C. § 466 et seq" to the Board of County Commissioners, Cuyahoga County, for construction of 'Chemical Clarification and Carbon Filtration and Adsorption as Secondary Treatment for Rocky River Wastewater Treatment Plant." The offer was made pursuant to Section 6 of the Federal Water Pollution Control Act (FWPCA), as amended, and required the grantee (hereinafter Rocky River) to act in accordance with the contents and conditions imposed by, inter alia, "Section 6 of the Clean Water Restoration Act of 1966." Pub. L. 89-753. It was accepted on or about August 16, 1968 by the County's Sanitary Engineer. The grant was described as the U.S. EPA Research Development and Demonstration Grant No. 11010 DAB after EPA was organized in 1970.

The grant offer in 1968 was $741,350 or 50% of eligible costs of the project. The grant amount was increased by a supplemental grant offer of $250,000 on March 3, 1971. Total eligible grant costs at that time were $2,573,610; therefore, EPA's award of a grant totalling $991,350 amounted to 37.2% of eligible costs.

Rocky River has requested EPA's advice as to its eligibility for reimbursement under Section 206(a) of the Clean Water Act (formerly FWPCA) for some of the costs which were not federally funded for this project. It previously sought reimbursement after passage of the 1972 amendments to the FWPCA (Pub. L. 92-500) and was advised that it was ineligible because it had initiated construction after the date specified in Pub. L. 92-500. [Rocky River's major construction contract was awarded on October 2, 1972 and Pub. L. 92-500 required that construction be initiated on or before July 1, 1972. In 1977, the FWPCA was amended and the date for initiation of construction in Section 206(a) was extended to July 1, 1973. (Pub. L. 95-217, Section 29). Thus, once again Rocky River asks EPA's advice as to whether it qualifies for a reimbursement grant under Section 206(a) as revised by the 1977 Amendments, Pub. L. 95-217.

Issue

Is Rocky River entitled to reimbursement under § 206(a) of the Clean Water Act for costs of construction in excess of those costs already paid from Federal grant funds?

Answer

No.

Discussion

Reimbursement under § 206(a) of the Clean Water Act, 33 U.S.C. § 1285(a), is available to grantees eligible for funding under §6 of the Federal Water Pollution Control Act Amendments of 1956 (Public Law 84-660, approved July 9, 1956). Section 6 provided federal funding for construction of sewage treatment plants in an amount not to exceed 50% of the "estimated reasonable cost thereof." (Section 6 was original with the Water Pollution Control Act of 1948, Pub. L. 80-845, and was redesignated Section 8 in 1956--see discussion below). It is the only provision for federal funding of sewage treatment plant construction in Pub. L. 84-660.

The Water Quality Act of 1965 (Pub. L. 89-234) introduced a new Section 6 to the existing water law and redesignated existing Section 6 to Section 8 of the water law. The new Section 6 provided for federal grants of up to 50% 1/ of the estimated reasonable cost of constructing a project which would

> serve as a useful demonstration of a new or improved method of controlling the discharge into any water of untreated or inadequately treated sewage or other waste from sewers . . . .

These grants became known as "research and demonstration grants" or simply "demonstration grants."

As to redesignated or old Section 6 (new Section 8), although Congress increased the appropriations in 1965, the law continued to provide for only 30% federal funding for construction of conventional or proven technology waste treatment plants under ordinary circumstances. Thus from 1966 to 1972, a grantee could get a larger federal share by constructing a demonstration plant (up to 75%) than it could for constructing a conventional plant (up to 30%). 2/

1/ The federal share was increased to a maximum of 75% by the 1966 Amendments. Clean Water Restoration Act of 1966, Pub. L. 89-753, § 201(a), 80 Stat. 1247.

2/ Pursuant to amendments in 1966, under special circumstances not relevant here, a grantee could receive a grant of up to 50% of construction costs. FWPCA, § 8(b)(5) and (7), Clean Water Restoration Act of 1966, Pub. L. 89-753, § 203(b)(6) and (7), 80 Stat. 1249.

In 1972, Congress rewrote all the existing federal water pollution control laws in the Federal Water Pollution Control Act Amendments of 1972 (Pub. L. 92-500). 33 U.S.C. § 1251, et seq. Section 201 (similar to § 8 of the prior law) authorized federal grants for construction of sewage treatment plants and Section 202 provided that the federal share should be 75% of construction costs. 33 U.S.C. §§ 1291, 1292. In order to remove any discrimination against states or municipalities which had not received full federal aid or had proceeded with construction of sewage treatment facilities without any federal aid, 3/ Congress passed a reimbursement provision for projects begun after June 30, 1966 but before enactment of the 1972 law (July 1, 1972). Such projects would be eligible for up to 55% federal funding of costs on a reimbursement basis.

The legislative history of the 1972 Amendments indicates that Congress was concerned about sewage treatment plants built without federal assistance during the earlier stages of the federal construction grant program. The report accompanying the Senate bill discussed the intent of the reimbursement provision: it was to be applicable to communities which prefinanced a portion of the federal share of the eligible cost of constructing waste treatment facilities in reliance upon section 8(c) of the FWPCA. That section was intended to provide an incentive to States to accelerate their municipal water pollution control projects ahead of the availability of federal appropriations on the belief that "allotments for any fiscal year ending prior to July 1, 1971 shall also be available for ... reimbursement of State or local funds ... to the extent that assistance could have been provided under [Section 8(c)] if such project had been approved pursuant to this section and adequate funds had been available." FWPCA, Pub. L. 84-660, § 6(c), 70 Stat. 502.

In 1972, Congress recognized that appropriations had fallen far short of expenditures and felt a moral obligation to rectify the shortfall. The report noted that "many large cities failed to receive the full federal contribution of 30% because of individual project limitations ... [$250,000] and because of inadequate appropriations for the construction grant program." S. Report 92-414, October 28, 1971, 92nd Cong., 2nd Sess. ____, reprinted in (1972) U.S. Code Cong. & Ad News 3698-3700.

Conspicuous by its absence, perhaps, is any mention of construction grants received under any other provisions of the prior laws. The only grant provision referred to in either the law or the legislative history is Section 8 of the FWPCA.

Rocky River received a research and development grant from EPA's predecessor agency pursuant to § 6(a) of Pub. L. 89-234 as amended by Pub. L. 89-753. There is no mention of research and demonstration grants per se or § 6(a)

3/ S. Rep. No. 92-414, Conf. Rep. No. 92-1236, 92nd Cong., 2nd Sess. ____, reprinted in (1972) U. S. Code Cong. & Ad News 3700, 3791.

grants in either the 1972 law or its legislative history, perhaps because no promise of possible reimbursement appears in § 6(a). On the contrary, the Congress seemed more concerned with grantees who either received no federal funding at all or those who did not get "their full 30%"-- neither condition applies to Rocky River. Thus, it cannot be deduced with any degree of certainty that Congress in enacting § 206(a) of the 1977 Amendments was particularly concerned with reimbursing recipients of § 6(a) grants for any shortfalls they may have experienced between the maximum allowed under the law and the amount actually received.

For this reason, we do not believe Rocky River would be eligible for a § 206(a) reimbursement grant under the 1977 law.

Even if the absence of any reference to Section 6(a) grantees cannot be taken as conclusory in terms of what Congress intended in the 1972 legislation with respect to reimbursement grants, it is not clear that Rocky River would be eligible for a grant under § 206(a) because of the initiation of construction difficulty outlined on page one of this memorandum.

The 1977 Amendments extended the initiation of construction date to July 1, 1973 so that projects begun after July 1, 1972 would still be eligible for reimbursement under § 206(a). Thus, Rocky River's October 1, 1972, start of construction would no longer be an obstacle to eligibility of the project for a reimbursement grant; however, the legislative history of the 1977 amendments is patently clear as to whom Congress intended the extended July 1, 1973 date to apply, viz. grantees under Pub. L. 84-660.

As the Conference Report on this amendment explains:

> The purpose of this amendment is to give equitable treatment to Public Law 84-660 projects which received less than either their 50 percent or 55 percent eligible grants and which were unable to initiate construction by the June 30, 1972 cut off date to qualify for reimbursement under section 206(a). H.R. Conf. Rep. No. 95-830 95th Cong., 1st Sess. 67, reprinted in (1977) U.S. Code Cong. & Ad. News 4442.

The amendment in the 1977 law appears at Section 29. Paragraph (b) of Section 29 extends the date for applications for reimbursement but also references the type of grant which is eligible for reimbursement, to wit:

> publicly owned treatment works for which a grant was made under the Federal Water Pollution Control Act, as amended by the Water Pollution Control Act amendments of 1956 (Public Law 660, 84th Congress). Clean Water Act, Pub. L. 95-217, § 29(b) 91 Stat. 1576. (emphasis added)

Thus, the 1977 Amendments and the accompanying legislative history clarified Congress' intent that only projects which had already received federal aid pursuant to Pub. L. 84-660 would be eligible for reimbursement under § 206(a) as amended by the 1977 law. 4/

4/ See also EPA regulations at 40 C.F.R. § 35.855.

(30)

gram alone, our subcommittee has proposed a number of changes which have yet to be put forth in legislative form. They include:

Consideration of alternative sources of funding.

Additional measures to increase the responsibility of grantees, such as withholding of a grant until the applicant operates any existing facilities with maximum efficiency, and withholding 20 percent of grant funding until a new facility performs as intended.

A strengthened role for the Environmental Protection Agency's Office of Inspector General in rooting out waste, fraud, and abuse.

Clearer and tighter lines of responsibility and accountability in the performance of design engineers, through such approaches as turnkey projects and reduced Federal interference in the design of facilities.

As I said, many of our oversight recommendations have yet to be formally offered on the assumption that the entire act will be reviewed again next year. But the extent to which our findings parallel the position taken by the conferees on the issues we both addressed suggests that our remaining recommendations—and earlier ones arising from our examination of the regulation of toxic pollutants—should find a receptive audience.

Meanwhile, I urge adoption of the conference report.

Mr. HAMMERSCHMIDT. Mr. Speaker, I reserve the balance of my time.

Mr. ROE. Mr. Speaker, I yield such time as he may consume to the gentleman from Ohio (Mr. MOTTL).

Mr. MOTTL. Mr. Speaker, I certainly appreciate the distinguished subcommittee chairman yielding at this point.

Mr. Speaker, I would like to ask the distinguished chairman of the Subcommittee on Water Resources (Mr. ROE) a question with regard to the construction grants program.

In my district the four communities of Rocky River, Bay Village, Fairview Park, and Westlake built a sewage treatment plant with EPA guidance. However, when this "pilot program" [illegible] was completed, it turned out that it did not operate properly. The plant, which finally completed with [illegible] modifications will serve about [illegible] people. The attempts on the part of these communities to receive [illegible] from EPA go back [illegible]. They have been unsuc[illegible] of EPA's contention [illegible] project, since it involved [illegible] technology. Is [illegible] a [illegible] construction grant project. [illegible] opinion [illegible] project is questionable [illegible] the act.

Mr. [illegible] Speaker, in [illegible] use [illegible] requires [illegible] opinion [illegible] communities [illegible] Wa[illegible] [illegible] standard [illegible]

managers urging the appropriation of funds to implement section 206 which provides for reimbursement of local interests when they perform work with their own money in accordance with requirements of the act. The project which the gentleman mentions is certainly the type of project which should be eligible upon the appropriation of funds, and we shall certainly do all we can on behalf of the State of Ohio.

Mr. HAMMERSCHMIDT. Mr. Speaker, will the gentleman yield?

Mr. MOTTL. Yes, I yield to the distinguished gentleman.

Mr. HAMMERSCHMIDT. Mr. Speaker, I want to associate myself with the remarks of our distinguished chairman in support of his response to the question of the gentleman from Ohio.

Mr. MOTTL. I thank the distinguished subcommittee chairman, also the full committee chairman, the gentleman from New Jersey (Mr. HOWARD), also the gentleman from Arkansas (Mr. HAMMERSCHMIDT), and the gentleman from California (Mr. CLAUSEN) for their cooperation.

Mr. ROE. Mr. Speaker, I yield 2 minutes to the distinguished gentleman from California (Mr. ANDERSON), a member of the committee.

Mr. ANDERSON. Mr. Speaker, I rise in support of the conference report on H.R. 4503, the Municipal Wastewater Treatment Construction Grant Amendments of 1981. I also wish to commend subcommittee chairman ROBERT ROE and ranking member JOHN PAUL HAMMERSCHMIDT for a job well done.

One of the provisions in the conference report on H.R. 4503 is of particular interest to me. This is section 4 which provides that the Administrator of EPA shall make a grant, from any funds otherwise allotted to the State of California, to the city of San Diego in connection with that city's aquaculture sewage process.

Nearly 100 percent of San Diego's water is imported. The high cost of this water together with the diminishing supply of ground and river water led San Diego to the planning of a wastewater to potable water recycle system. This system which will use vascular plants and reverse osmosis technology will result in the production not only of treated sewage effluent but of potable water. The production of potable water will not only help meet the water supply needs of the region but will result in a more economical system.

This type of innovative and alternative technology is important not only to San Diego but to other communities throughout the Nation which are facing water supply problems. The encouragement of this type of project is [illegible] in the national interest. It [illegible] the type of innovative and [illegible] technology which must be [illegible] that we may truly achieve the optimum yield from our finite water resources.

Mr. ROE. Mr. Speaker, I yield 2 minutes to the distinguished gentleman from California (Mr. PANETTA).

(Mr. PANETTA asked and was given permission to revise and extend his remarks.)

Mr. PANETTA. Mr. Speaker, I, too, rise in support of this legislation. I think it is extremely important to maintain our commitments that have been made over the years in this area. With regard to that, I would like to speak to one particular project.

The agricultural irrigation demonstration project in Castroville, Calif., is unique. It is the only program in the United States utilizing secondary treated municipal waste water for commercial crop irrigation. The benefits of this program are two-fold. It reduces the demand on precious limited water resources and by reducing the overdraft of the local ground water supply helps to combat the increasing threat of salt water intrusion into the agricultural producing areas along Monterey Bay.

Earlier this year some questions were raised over the use of construction grant funds for the agricultural irrigation demonstration project. Clearly use of these funds for water reclamation and reuse purposes serves the objectives and intent of Congress in creating the construction grants program. To prohibit further assistance for this project would be a tragic step backward from our national commitment to the innovative and creative conservation of our precious water resources.

The agricultural irrigation demonstration project serves to demonstrate that a lesser level of treatment than that which may be provided by a Monterey regional wastewater treatment plant, provides acceptable public health protection. It also demonstrates to local farmers and local public health officials that reclamation does not adversely affect crops or soils in the project area. Finally, the program demonstrates that crops so irrigated are marketable and acceptable to the public.

I would like to briefly review for you the project's progress over the past few years. In March of 1978 a 2-year study was completed in which the concept of the demonstration project was examined, a work plan developed, a site selected, and conceptual designs and environmental assessments completed. Between 1978 and 1980 [illegible] and construction of [illegible] treatment plant and [illegible] and preparation of [illegible] and purchase of [illegible] was completed. [illegible] of the project [illegible] which treated water [illegible] used to irrigate crops [illegible] circumstances to [illegible] the effects. After [illegible] this highly successful [illegible]

Dear Ron:

I would like to thank you for having appeared before our HUD/Independent Agencies Subcommittee yesterday to present your case for reimbursement of the Rocky River Area Sewage Treatment Plant.

You will be pleased to know that your colleague, Louis Stokes, made a forceful presentation which served to amplify your earlier testimony.

I hope that some accommodation can be made for Rocky River, because it seems clear that your constituents deserve some recourse for their early efforts to achieve cleaner water.

With my best wishes and kindest regards,

Sincerely,

Lindy

The Hon. Ron Mottl
2459 Rayburn HOB
U.S. House

Dear Ron:

Thank you for yesterday's letter to me and for taking the time to appear before the HUD Subcommittee. Your testimony was strong and persuasive.

As I am sure you know by now, the Subcommittee felt it was not able to comply with your request and did approve a funding resolution which prohibits appropriations for Section 206 of the reform legislation. The Subcommittee has a long tradition of resisting earmarking of funds for specific projects. I will say, however, that Lou Stokes made a very strong effort on your behalf during mark-up. Unfortunately, the other Members felt that, if we allowed funding for Section 206, we would also have to allow funding for Section 201(M), which affects three California cities, and other sections. In fact, in supporting the Subcommittee's decision to resist earmarking, I also had to accept the prohibition of funding of Section 205(K) which would have benefitted a convention center project in Manhattan.

I realize that this must be a disappointment for you, but I hope that you understand the concerns of the Members of the Subcommittee. I would be happy to discuss this further with you any time if you would like additional clarification of our actions.

Sincerely,

Bill

Bill Green
Member of Congress

Re: Cuyahoga County's Rocky River Wastewater Treatment Plant Activated Carbon Process Reimbursement

Dear Lou:

During the 1970's the Cuyahoga County Board of County Commissioners and the Cities of Bay Village, Fairview Park, Rocky River and Westlake unsuccessfully attempted to obtain reimbursement by the U.S. EPA for the activated carbon treatment process at the Rocky River Wastewater Treatment Plant that was constructed in the mid 1970's. The basis for the reimbursement request was Section 206 (a) of the Clean Water Act Amendments of 1972 and 1977.

Recently Congressman Ronald M. Mottl, who represents those four communities, has attempted to clarify the congressional intent of the 1972 and 1977 legislation so that the U.S. EPA could provide the 55 percent reimbursement for this unsuccessful research and development grant project.

We have been advised by Congressman Mottl that the best solution to this reimbursement problem probably involves a specific appropriation of funds for such reimbursements.

The Cuyahoga County Board of County Commissioners and the Mayors and Councils of the four communities that are serviced by this plant feel very strongly that this activated carbon process is entitled to reimbursement in accordance with the 1972 and 1977 legislation.

We respectfully request your cooperation as a member of the Cuyahoga County Congressional Delegation and in your position as an influential member of the House Appropriations Committee to assist us in our attempts to obtain this reimbursement.

Your interest and cooperation in this matter is very much appreciated.

Sincerely yours,

VIRGIL E. BROWN, President
Board of County Commissioners

istrator may otherwise direct. Final payment will be made only after a final inspection by an EPA representative upon completion of the project.

Subpart D—Reimbursement Grants

AUTHORITY: Sec. 206, Federal Water Pollution Control Act Amendments of 1972, as amended by Pub. L. 93-207 and section 29 of Pub. L. 95-217.

SOURCE: 43 FR 7426, Feb. 23, 1978, unless otherwise noted.

§ 35.850 Purpose.

(a) This subpart governs funding under section 206(a) of the Federal Water Pollution Control Act, as amended, for publicly owned sewage treatment works on which construction was initiated after June 30, 1972, but before July 1, 1973, which was authorized by Pub. L. 95-217, December 27, 1977.

(b) Funding under section 206 for publicly owned sewage treatment works on which construction was initiated after June 30, 1956 but before July 1, 1972, and for which applications were due January 31, 1974, is governed by the applicable provisions of the previously promulgated Subpart D regulations (39 FR 3678, January 29, 1974 and 39 FR 49855, November 21, 1974).

§ 35.855 Project eligibility

Grants may be made for reimbursement of State or local funds used for public sewage treatment works projects on which construction was initiated after June 30, 1972, but before July 1, 1973, and for which a grant was awarded under section 8 of Pub. L. 84-660.

§ 35.860 Eligible and ineligible costs.

(a) Eligible costs of construction include costs of preliminary planning to determine the economic and engineering feasibility of treatment works; the engineering, architectural, legal, fiscal, and economic investigations and studies, surveys, designs, plans, working drawings, specifications, procedures, and other action necessary to the construction of treatment works; the erection, building, acquisition, alteration, remodeling, improvement, or extension of treatment works; and the inspection and supervision of the construction of treatment works.

(b) Ineligible costs include collector sewer lines and land acquisition.

§ 35.865 Applications.

(a) An application for a grant must be received by the appropriate Regional Administrator on or before March 27, 1978.

(b) An application for reimbursement shall be made in writing (if mailed, a return receipt should be requested) and shall contain the following information:

(1) Brief description of project.

(2) Total actual or estimated eligible cost of project as of March 27, 1978.

(3) Total amount of Pub. L. 84-660 funds and any other Federal assistance received to date.

(4) Amount of additional Federal financial assistance requested under section 206 of the Act.

(5) The dates (actual or estimated) of initiation and completion of construction.

(6) Evidence of approval by State agency.

(c) The applicant must furnish such other information as may be required for determination of eligibility for and amount of reimbursement under this subpart.

§ 35.870 Grant amount.

(a) For a project described in § 35.855, the grant amount shall not exceed a total amount equal to the difference between the amount of Federal financial assistance, if any, received under Pub. L. 84-660 (as amended) for the project, and 50 percent of the allowable costs of the project (or 55 percent of the costs where the Administrator determines that project construction was undertaken in conformity with a comprehensive metropolitan treatment plan). However, reimbursement for project costs from all Federal grant sources may not exceed 80 percent of the costs of the project.

(b) A reimbursement grant will be rounded to the nearest hundred dollars. Reimbursement grants will not be awarded to projects entitled to reimbursement of less than $1,000.

February 5, 1982

Hon. Ronald M. Mottl, M.C.
House Office Building
Washington, D.C. 20515

Dear Congressman Mottl:

We very much appreciate your continued efforts to obtain the U.S. EPA reimbursement of the activated carbon treatment construction at the Rocky River Wastewater Treatment Plant. In reviewing the materials you have kindly continued to send to me I continue to be very concerned about U.S. EPA's negative attitude towards the eligibility of this activated carbon process for reimbursement in accordance with Section 206 (a) of the Clean Water Act Amendments of 1972 and as amended in 1977.

I would appreciate some clarification as to why this research and development grant project did not meet the requirements of Section 8 of the original Water Pollution Control Act even though the grant was received under Section 6. Although the activated carbon process was an experimental process it was intended to satisfy the secondary treatment requirements for the total sewage flow received from Bay Village, Fairview Park, Rocky River and Westlake. It would seem that that objective would have satisfied the intention of projects funded under Section 8.

It would also seem that the last sentence of the Section 206(a) of the 1972 legislation would allow for such research and development projects to be reimbursed by the use of the words "....any such works receiving federal grants from all sources....". Those words would seem to indicate that projects eligible for reimbursement would not have been exclusive Section 8 grant projects.

Despite your excellent efforts to clarify this situation on the floor of Congress and your excellent efforts to have appropriation monies established for such reimbursement, I continue to have the feeling that U.S. EPA is continuing to take the position that research and development grant projects will not be eligible for such reimbursement.

Please advise us as to anything we can do to assist you in changing U.S. EPA's current position in this matter.

Thanks again for your excellent cooperation in this matter.

Very truly yours,

John J. Garner

SEWAGE TREATMENT CONSTRUCTION GRANTS MANUAL

Volume 6, Number 4 THE BUREAU OF NATIONAL AFFAIRS, INC. February 22, 1982

Includes Filing Instructions, page 16.

NEWS AND DEVELOPMENTS

REAGAN'S PROPOSED FISCAL 1983 BUDGET WOULD PROVIDE EPA FUNDING OF $3.6 BILLION

President Reagan Feb. 8 submitted to Congress a fiscal 1983 budget request of $3.6 billion for the Environmental Protection Agency, including $961 million for the agency's operating budget and $2.4 billion for the sewage treatment construction grants program.

The $961 million operating budget represents a 12 percent decrease from the fiscal 1982 appropriations of $1.086 billion and a 29 percent reduction from the fiscal 1981 appropriations of $1.35 billion.

Construction Grants Program

The Administration requested an emergency supplemental appropriation of $2.4 billion for the sewage treatment construction grants program in fiscal 1982, following enactment of authorizing legislation in December (News and Developments, Jan. 25, p. 9). Legislation enabling appropriation of the full amount is being considered in Congress (See related story, p. 14). If a full appropriation is approved, obligations are estimated to total $3.4 billion for 642 new Step 3 construction awards for sewage treatment projects.

The Administration also requested $2.4 billion for fiscal 1983. The funds would be used to finance 664 new Step 3 awards, according to EPA. Program resources also would be used for preparing a new survey of sewage treatment needs in the United States, for maintaining a detailed review process for funding decisions on advanced treatment projects, and for continuing the multi-year interagency agreement with the Army Corps of Engineers to reduce the backlog of projects and to inspect ongoing ones.

During fiscal 1982, EPA said, it would concentrate on closing out projects, so that by the end of fiscal 1983, 1,250 projects would be completed.

In view of the fiscal 1981 program rescission of $1.7 billion requested by Reagan and approved by Congress last summer, outlay will decrease by $700 million in fiscal 1983, representing the first major reduction in federal expenditures for the program, according to EPA.

By the end of fiscal 1983, EPA said, 46 states will have accepted delegation of project management responsibilities, so that the agency can reduce its resources and shift to a role of "overall program manager."

New Federalism Proposal

Earlier in his Jan. 26 State of the Union address, Reagan called for a new federalism initiative that involved turning over to the states by 1988 40 federal grant programs, including the Clean Water Act's sewage treatment construction grants program.

The President said the shift was necessary to control the growth of federal grants in aid programs. He also said he intended to cut more non-essential government spending, end more government waste, and continue efforts to reduce the number of federal employees.

During Phase I, states could fund the grant programs through a new $28 billion annual federal trust fund, which would be reduced by 25 percent a year during Phase II, according to Reagan.

Under the new federalism initiative, more than 40 categorical and block grant programs, including the sewage treatment construction grants program, would be turned back to states on a voluntary basis in Phase I (fiscal 1984 to 1987) and on a permanent basis in Phase II (fiscal 1988 to 1991). Rural water/sewer and facilities grants were among others included in the proposal.

Reactions to Federalism Proposal

Andrew Elliott, manager of public affairs for the Water Pollution Control Federation, said the group is generally supportive of the President's idea but is waiting for details. He said the federalism proposal appears to be consistent with the 1981 Clean Water Act amendments to the sewage treatment construction grants program and consistent with the federation's tentative proposal for phasing out the construction grants program.

Elliott said, however, that if states are unable to assume the program fully when envisioned by the President, there should still be a federal role in supporting wastewater plant construction, perhaps through a trust fund, a low interest loan program, or some other federal funding source.

Larry Silverman, of the Clean Water Action Project and executive director of the American Clean Water Association, said the federalism proposal and President Reagan's commitment to approximately $48 billion over the next 10 years for sewage treatment construction under the 1981 Water Act amendments are generally compatible.

The 1981 amendments to the Act are the first step in a smooth transition of transferring the program to states, Silverman said. "If states can't clean up their own pollution, they can't be trusted with much of anything else," he commented.

A staff member of the National Governors' Association, however, said that to enact Reagan's proposal Congress would have to go back and amend the Clean Water Act, and "right now the chances of that are virtually nil, because Congress just completed action on it.

"Too many people fought too hard for a whole year to get the reforms we now have, and I don't think people are amenable to changing them anytime in the near future," the staff member said, adding that the group will have to look more closely at Reagan's proposal before commenting on transfer of the sewage treatment program to states.

An NGA spokesman said that, because so little is known about the details of Reagan's proposal, much depends on how the Administration, Congress, and the state and local partners answer the questions of whether the states have the necessary capacity to [illegible]

face of enormous budget cuts and whether a plan with an equalizing formula will be developed.

And a congressional staff member added that the President's federalism proposal "certainly does not appear compatible with the recently passed sewage treatment legislation, which contemplates a continuing federal role through the next four years."

EPA SCHEDULE FOR REGULATORY CHANGE SET TO COINCIDE WITH FISCAL 1982 FUNDING

The Environmental Protection Agency's Office of Water Program Operations recently established a regulatory and guidance schedule for the sewage treatment construction grants program that office officials hope will dovetail with the enactment of a fiscal 1982 appropriation for the program (See related story, p. 14).

The schedule calls for *Federal Register* publication in April of both the regulatory revisions launched last August by EPA Deputy Administrator John Hernandez and the regulatory changes mandated by 1981 Clean Water Act amendments (PL 97-117). The changes would take the form of interim final regulations and would set the requirements under which grants using fiscal 1982 money could be awarded.

Program officials told BNA Jan. 15 no opposition has emerged to full funding of the program at $2.4 billion in fiscal 1982, and they expect Congress to complete action on an appropriations bill by April.

In addition to the interim final regulations, the office also plans in April to publish a new guidance document on financial capability and revised guidance documents on facilities planning and municipal construction to accommodate changes resulting from the new amendments.

The office's schedule called for publication of the regulations in draft form by the end of January, incorporating the changes proposed last August (News and Developments, Sept. 28, 1981, p. 41) and those required by PL 97-117; public comment during February, and opportunity for review and approval by top agency officials and the Office of Management and Budget during March.

Under the schedule, the comment period on the interim final regulations would occur during April and May, and the rules would be published in final form in June. EPA hopes to have this process completed in time to meet the July 1 deadline for having the final rule included in this year's update of the Code of Federal Regulations.

Completion of a new user charge handbook and utility management manual supplement is also set for July.

Also in July, review and possible revisions are scheduled for completion on three other sets of regulations that affect the construction grants program, water quality management, procurement, and ocean discharge.

The office schedule noted that regulatory revisions regarding pretreatment, public participation, and the National Environmental Policy Act are "being developed," but gave no date for their completion.

Mandated Regulatory Changes

A Jan. 12 memorandum from Harvey Pippen, director of EPA's Grants Administration Division, to regional administrators outlined these five regulatory changes that PL 97-117 requires immediately:

- Section 3 of the Act prohibits the agency from awarding Step 1 (planning) or Step 2 (design) grants. Instead, EPA now will "make allowance" in Step 3 (construction) grants for funds spent during the facility planning and advanced engineering and design phase "at the prevailing federal share and based on a percentage of total project cost."

Pippen's memorandum said EPA "will determine the percentage based on our general experience with prior projects and issue necessary data by April 1982."

- Section 8 reinstates the innovative and alternative program and establishes a mandatory I/A reserve for fiscal 1982 through fiscal 1984 of 4 percent, but permits state governors to reserve up to 7.5 percent.

Because I/A authorizing legislation expired Sept. 30, 1981, EPA had allowed states to release unobligated fiscal 1981 I/A reserves for other projects, with the understanding that they would be required to re-establish the fiscal 1981 reserves if Congress reauthorized the program.

Since Congress did so in PL 97-117, states that reduced the fiscal 1981 reserve will now be required to reinstate it based on their fiscal 1981 allotment, according to EPA. If a state's fiscal 1981 reserve is not obligated for increases on I/A projects by Sept. 30, it will be subject to reallotment.

- Section 9 increases the cost limit on combined Step 2 and 3 grants from $4 million to $8 million. The regulations therefore will be revised to permit small grantees with projects that have total Step 3 costs of $8 million or less to apply for combined Steps 2 and 3 grants, according to EPA.

However, since, under Section 3 of the Act, EPA no longer awards Step 2 grants, the new regulations "will take into account the new allowance authority for Step 1 and 2 work and the states' new authority to advance funds to small communities for Step 1 and 2 work," Pippen's memorandum explained.

In the meantime, it said, EPA will continue to reimburse Step 2 costs as it has in the past, for combined Step 2 and 3 grants awarded after Dec. 29, 1981, the day President Reagan signed PL 97-117.

- Section 11 allows grantees' plans and specifications to cite only one brand name of equipment or its equal. Previously, grantees were required to cite two brand names. The new regulations will reflect this change, according to EPA.

- Section 14 permits states to increase their state management assistance grant reserve from 2 percent of its allotment after Sept. 30, 1981, to 4 percent, based on the amount authorized. This change in the law is also to be reflected in the new regulations.

The regulatory class deviation outlined in Pippen's memorandum was published in the *Federal Register* Jan. 28 (47 FR 4066). It goes into effect immediately.

CONSTRUCTION GRANTS FUNDING BILL FOR FISCAL 1982 MOVING THROUGH CONGRESS

A supplemental appropriations bill (HJ Res. 390) providing $2.4 billion in fiscal 1982 for the sewage treatment construc-

tion grants program under the Clean Water Act is progressing rapidly through Congress.

The Senate Appropriations Subcommittee on HUD-Independent Agencies scheduled a hearing for Feb. 10 on the bill (HJ Res 390).

The House was expected to pass the measure Feb. 10. The House Appropriations Committee reported the bill Feb. 4.

The committee acted after agreeing not to fund specific projects earmarked for funding in the Municipal Wastewater Treatment Construction Grant Amendments of 1981 (PL 97-117) (News and Developments, January 25, p. 9). The amendments revised and extended the construction grants program (Title II) of the Act and are included in the supplement to this issue.

The House panel also agreed to a request by Committee Chairman Jamie L. Whitten (D-Miss) that the report on HJ Res 390 include language directing the Environmental Protection Agency not to approve large projects in small communities that are unable to finance their operation and maintenance.

HJ Res. 390 would prohibit funding for Section 206 (reimbursement and advanced construction), Section 208 (areawide waste treatment management), Section 209 (basin planning), and several specific projects named in PL 97-117.

The projects denied funding would include a sewer line connecting the New York City Convention Center with a treatment plant on Long Island, a greenhouse at a San Francisco treatment plant, facilities to purify water at a San Diego plant, a 139-acre tract at a Eureka, Calif., plant, and construction of the Rocky River, Ohio, plant.

EPA DEFERS FOUR PRETREATMENT RULES, PUTS OTHERS INTO EFFECT; COMMENTS CITED

The effective date of four general pretreatment regulations was postponed indefinitely, "pending continued analysis," and others were put into effect as of Jan. 31, under a final rule issued by the Environmental Protection Agency Feb. 1 (47 FR 4518).

The provisions deferred were the definitions of "interference" and "pass through," the combined wastestream formula, and the removal credits provision.

Regulations put into effect include those pertaining to general pretreatment prohibitions, those governing local and state pretreatment programs, and certain of those governing the implementation of the categorical pretreatment standards, including the provisions for monitoring, fundamentally different factors variances, net/gross calculations, and upsets.

As a result of the postponements, EPA said the existing definition of "interference" and the present removal credits section of the current pretreatment regulations will remain in effect.

The agency noted that the rules involved in its Feb. 1 action are part of amendments to the original general pretreatment regulations promulgated June 26, 1978, under the Clean Water Act.

The amendments resulted from a settlement agreement entered into by EPA and several environmental and industrial groups that challenged the 1978 regulations in federal court, the agency explained (*NRDC, Inc. v. EPA*, 8 ERC 2120).

Combined Wastestream Formula

An EPA official told BNA Feb. 8 the four items are being postponed largely as a result of industry complaints that they are too stringent.

He said, for example, that some industries want to be allowed under the combined wastestream formula to dilute their discharge with sanitary waste and cooling water to help meet the numerical limits of their categorical pretreatment standards. Such dilution would not have been permitted under the postponed regulation, he added.

Industry claims it will be forced to install pollution control equipment for each manufacturing process within a large plant instead of a single pollution control facility at the end of all processes in order to meet its toxic discharge limits, unless dilution is allowed, the EPA official said.

The agency originally disagreed with this view and concluded that if dilution were allowed a plant could discharge excessive amounts of toxics into a publicly owned treatment works (POTW), yet still be in compliance with its categorical pretreatment standards, the agency official noted. He indicated that industry objections to EPA and the White House led the agency to reconsider its position.

As long as the formula is delayed, POTWs are protected from toxic discharges that exceed the categorical limits only by general pretreatment provisions and local laws, most of which are weak and ineffective, the official said.

Regulatory Impact Analysis Ordered

The amendments originally were scheduled to take effect March 13, 1981, but they were postponed pending completion of a regulatory impact analysis requested under Executive Order 12291 issued by President Reagan.

Its Feb. 1 action, EPA explained, stemmed from a rule-making the agency initiated Oct. 13, 1981, to determine whether all or portions of the amendments should continue to be deferred.

The combined wastestream formula that is being postponed, EPA said, "has proved to be a highly controversial provision." Comments submitted to the agency charged that the formula "forces segregation of wastestreams and, ultimately, more costly and inefficient treatment," EPA said.

The removal credits provision, the agency said, "remains controversial," and the definitions of "interference" and "pass through" have been criticized as being too vague and as subjecting the industrial user to excessive liability.

EPA noted that many public comments labeled the proposed removal credit provision as "too burdensome and complex" and predicted it would discourage POTWs from applying for authorizations to grant the credits.

Many comments said the new definitions of "interference" and "pass through" were overbroad "because an industrial user could be held liable for a POTW violation of its national pollutant discharge elimination system permit even though the user was in compliance with applicable federal, state, or local standards," EPA added.

OMB REVIEW OF EPA FORMS INCLUDES CONSTRUCTION GRANTS CHANGE ORDER SURVEY

The Office of Management and Budget Jan. 18 sought comment on the Environmental Protection Agency's questionnaire on the effect of change orders on construction grants.

The questionnaire is being reviewed by OMB as part of an ongoing evaluation of paperwork the federal government requires the public to do. The reviews are authorized under the Federal Reports Act and the Paperwork Reduction Act of 1980.

Comments may be sent to Edward H. Clarke, Office of Information and Regulatory Affairs, OMB, 726 Jefferson Pl. N.W., Washington, D.C. 20503.

EPA SEEKS COMMENTS ON DRAFT PAPER ON CONSTRUCTION GRANTS RULE CHANGES

A draft paper recommending revisions to the sewage treatment construction grants program under the Clean Water Act is available for public comment, the Environmental Protection Agency announced Feb. 2 (47 FR 4704).

The paper includes the proposed revision of the full regulation published Nov. 6, 1981, and amendments needed to carry out the Municipal Wastewater Treatment Construction Grant Amendments of 1981 (PL 97-117). (See related story, p. 14)

Comments on the draft may be submitted until Feb. 28 to the Director, Office of Water Program Operations (WH 546), EPA, 401 M St., S.W., Washington, D.C. Copies of the draft may be obtained from the director's office.

For further information, telephone Jane Magee of EPA at (202) 755-8253.

EPA said the Feb. 28 deadline for comments "is essential" if the agency is to have interim final regulations in place to authorize grant making in the event of an appropriation for the 1982 fiscal year.

EPA AMENDS CONSOLIDATED PERMIT RULES FOR STORAGE CONTAINER AREAS, WASTE PILES

Amendments to the consolidated permit regulations will exempt owners and operators of hazardous waste facilities who apply for a permit to manage solids in containers and waste piles from containment system requirements if they can demonstrate that the waste does not contain free liquids.

Moreover, the amendments, adopted by the Environmental Protection Agency November 6, 1981, and included in the supplement to this issue, affect section 122.25, which establishes the information required to be included in Part B of the permit application. The amendments also waive the containment system requirements for all container storage areas holding only solids, provided that the containers are protected from contact with accumulated liquid such as precipitation that could corrode and deteriorate metal containers, as well as containers holding solids from the calculation of 10 percent containment system capacity.

SUPPLEMENT 54 FILING INSTRUCTIONS

NOTE: The instructions below should be followed carefully. The boldface headings on the left correspond to the yellow tab sections in the Sewage Treatment Construction Grants Manual binders. Obsolete pages in your service are listed in the column headed "Take Out Pages." New and replacement pages in this supplement are listed in the column headed "Put In Pages." It is important to follow instructions in both columns.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

(37)

MAR 26 1982

Mr. John J. Garner, P.E.
Sanitary Engineer
County of Cuyahoga
75 Public Square
Cleveland, Ohio 44113

Dear Mr. Garner:

Congressman Mottl has asked that I respond directly to your letter to him dated February 5, 1982, concerning this Agency's position that the Rocky River Wastewater Treatment Plant, originally funded as a research and demonstration project, is ineligible for funding under the "reimbursable provisions" of section 206(a) of the Clean Water Act.

The present position that the Rocky River Plant is ineligible for reimbursement is based on two issues: the fact that construction of the project was initiated in October 1972 and the Agency's legal interpretation of section 206(a). That interpretation, based on the legislative history of the Clean Water Act of 1977 which amended section 206(a), is that a project on which construction was initiated between July 1, 1972, and July 1, 1973, must have received a grant under section 8 of the Federal Water Pollution Control Act as amended by Public Law 84-660 in order to be considered eligible for reimbursement.

Even if construction of the Rocky River project had been initiated prior to July 1, 1972, it could not have qualified for reimbursement because the legislative history of the Federal Water Pollution Control Act Amendments of 1972 indicates that the intent of section 206(a) was to reimburse those communities which had prefinanced a portion of the Federal share of the eligible cost of constructing waste treatment facilities in reliance upon section 8(c) of the Federal Water Pollution Control Act. Rocky River, as you know, received its assistance under section 6.

Initiation of construction as used in this letter means the issuance to a construction contractor of a notice to proceed, or if no such notice is required, the execution of a construction contract.

Our position on the reimbursement status of this project has nothing to do with the technology employed by the Rocky River project or whether the project did, or did not, meet the general conditions of Section 8. The position is based solely on what we believe to be the restraints placed on us by the present legislation. The matter is further complicated by the fact that Congress has specifically forbidden the use of any funds for reimbursement unless specifically appropriated for that purpose.

It is our understanding that Congressman Mottl is continuing to work on resolving this matter and we are ready to assist him in any way we can.

Sincerely yours,

John W. Hernandez, Jr.
Deputy Administrator

Mr. Richard Sullivan
Committee on Public Works
and Transportation
Rm. 2165, Rayburn Bldg.
Washington, D.C. 20515

Re: Reimbursement for Unsuccessful Activated Carbon Process Construction for the Rocky River Wastewater Treatment Plant

Dear Mr. Sullivan:

As you probably know, Cuyahoga County, despite the excellent efforts of Congressmen Ronald Mottl and Louis Stokes, has been unable to obtain the referenced reimbursement. We had hoped that the dialogue between Congressman Mottl and Congressmen Roe and Hammerschmidt, as contained in the attached House Congressional Record of December 16, 1981, Page H 9829, would have clarified Congress' original intent in this matter. Unfortunately, as indicated by the attached copy of my letter to Congressman Mottl on February 5, 1982, and the attached copy of USEPA Deputy Administrator John W. Hernandez, Jr.'s letter to me, dated March 26, 1982, the USEPA is still taking the position that a project receiving a research grant under Section 6 does not qualify for the additional 50 or 55 percent reimbursement that we feel we are justified in obtaining.

The crux of the matter continues to appear to be "congressional intent" at the time P.L. 92-500 was enacted in 1972. We would appreciate very much if you could clarify from the congressional staff perspective, with copies of any documents that would be applicable, that such Section 6 projects were not intended to be excluded from such reimbursement.

The attached documents are in addition to the documents I transmitted to you by letter dated December 1, 1981, on this subject.

I would be very happy to send you any documents, or to meet with you at your convenience, regarding this matter.

Thank you for your continued interest and cooperation in this matter.

Very truly yours,

John J. Garner

JOHN J. GARNER, P.E.
Sanitary Engineer

grant, alone, our subcommittee has proposed a number of changes which have yet to be put forth in legislative form. They include:

Consideration of alternative sources of funding.

Additional measures to increase the responsibility of grantees, such as withholding of a grant until the applicant operates any existing facilities with maximum efficiency, and withholding 20 percent of grant funding until a new facility performs as intended.

A strengthened role for the Environmental Protection Agency's Office of Inspector General in rooting out waste, fraud, and abuse.

Clearer and tighter lines of responsibility and accountability in the performance of design engineers, through such approaches as turnkey projects and reduced Federal interference in the design of facilities.

As I said, many of our oversight recommendations have yet to be formally offered on the assumption that the entire act will be reviewed again next year. But the extent to which our findings parallel the position taken by the conferees on the issues we both addressed suggests that our remaining recommendations—and earlier ones arising from our examination of the regulation of toxic pollutants—should find a receptive audience.

Meanwhile, I urge adoption of the conference report.

Mr. HAMMERSCHMIDT. Mr. Speaker, I reserve the balance of my time.

Mr. ROE. Mr. Speaker, I yield such time as he may consume to the gentleman from Ohio (Mr. MOTTL).

Mr. MOTTL. Mr. Speaker, I certainly appreciate the distinguished subcommittee chairman yielding at this point.

Mr. Speaker, I would like to ask the distinguished chairman of the Subcommittee on Water Resources (Mr. ROE) a question with regard to the construction grants program.

In my district the four communities of Rocky River, Bay Village, Fairview Park, and Westlake built a sewage treatment plant with EPA guidance. However, when this "pilot program" plant was completed, it turned out that it did not operate properly. The plant, when finally completed with design modifications will serve about 80,000 residents. The attempts on the part of local communities to receive reimbursement from EPA go back many years. They have been unsuccessful because of EPA's contention that the project, since it involved experimental technology, is not a normal construction grant project. I ask the gentleman's opinion as to whether or not this project is qualified for reimbursement under the act.

Mr. ROE. Mr. Speaker, in response to the gentleman's inquiry, in my opinion the four communities are eligible for reimbursement. We have in [illegible] the statement of managers urging the appropriation of funds to implement section 206 which provides for reimbursement of local interests when they perform work with their own money in accordance with requirements of the act. The project which the gentleman mentions is certainly the type of project which should be eligible upon the appropriation of funds, and we shall certainly do all we can on behalf of the State of Ohio.

Mr. HAMMERSCHMIDT. Mr. Speaker, will the gentleman yield?

Mr. MOTTL. Yes, I yield to the distinguished gentleman.

Mr. HAMMERSCHMIDT. Mr. Speaker, I want to associate myself with the remarks of our distinguished chairman in support of his response to the question of the gentleman from Ohio.

Mr. MOTTL. I, thank the distinguished subcommittee chairman, also the full committee chairman, the gentleman from New Jersey (Mr. HOWARD), also the gentleman from Arkansas (Mr. HAMMERSCHMIDT), and the gentleman from California (Mr. CLAUSEN) for their cooperation.

Mr. ROE. Mr. Speaker, I yield 3 minutes to the distinguished gentleman from California (Mr. ANDERSON), a member of the committee.

Mr. ANDERSON. Mr. Speaker, I rise in support of the conference report on H.R. 4503, the Municipal Wastewater Treatment Construction Grant Amendments of 1981. I also wish to commend subcommittee chairman ROBERT ROE and ranking member JOHN PAUL HAMMERSCHMIDT for a job well done.

One of the provisions in the conference report on H.R. 4503 is of particular interest to me. This is section 4 which provides that the Administrator of EPA shall make a grant, from any funds otherwise allotted to the State of California, to the city of San Diego in connection with that city's aquaculture sewage process.

Nearly 100 percent of San Diego's water is imported. The high cost of this water together with the diminishing supply of ground and river water led San Diego to the planning of a wastewater-to-potable water recycle system. This system which will use vascular plants and reverse osmosis technology will result in the production not only of treated sewage effluent but of potable water. The production of potable water will not only help meet the water supply needs of the region but will result in a more economical system.

This type of innovative and alternative technology is important not only to San Diego but to other communities throughout the Nation which are facing water supply problems. The encouragement of this type of project is directly in the national interest. It represents the type of innovative and alternative technology which must be pursued so that we may truly achieve the optimum yield from our finite water resources.

Mr. ROE. Mr. Speaker, I yield 2 minutes to the distinguished gentleman from California (Mr. PANETTA).

(Mr. PANETTA asked and was given permission to revise and extend his remarks.)

Mr. PANETTA. Mr. Speaker, I, too, rise in support of this legislation. I think it is extremely important to maintain our commitments that have been made over the years in this area. With regard to that, I would like to speak to one particular project.

The agricultural irrigation demonstration project in Castroville, Calif., is unique. It is the only program in the United States utilizing secondary treated municipal waste water for commercial crop irrigation. The benefits of this program are twofold. It reduces the demand on precious limited water resources and by reducing the overdraft of the local ground water supply helps to combat the increasing threat of salt water intrusion into the agricultural producing areas along Monterey Bay.

Earlier this year some questions were raised over the use of construction grant funds for the agricultural irrigation demonstration project. Clearly use of these funds for water reclamation and reuse purposes serves the objectives and intent of Congress in creating the construction grants program. To prohibit further assistance for this project would be a tragic step backward from our national commitment to the innovative and creative conservation of our precious water resources.

The agricultural irrigation demonstration project serves to demonstrate that a lesser level of treatment than that which may be provided by a Monterey regional wastewater treatment plant, provides acceptable public health protection. It also demonstrates to local farmers and local public health officials that reclamation does not adversely affect crops or soils in the project area. Finally, the program demonstrates that crops so irrigated are marketable and acceptable to the public.

I would like to briefly review for you the project's progress over the past few years. In March of 19[illegible] a 2-year study was completed in [illegible] concept of the demonstration [illegible] was examined, a work plan [illegible] site selected, and [illegible] signs and environmental [illegible] completed. Between 19[illegible] and [illegible] and construction of the [illegible] treatment plant and [illegible] and preparation of [illegible] and purchase of [illegible] was completed. The operation [illegible] of the project has [illegible] which treated wastewater [illegible] used to irrigate [illegible] circumstances to [illegible] the effects. Aft[illegible] this signs [illegible]

Mr. ROE. We would like to have from you, then, your view. The good Congressman spoke to $1.3 million, but Mr. Martin, you have another view. It is a 25-year-old bond issue, the full faith and credit of the city was placed on the line, you have paid this much back, the interest rate was so much, and the rest of it. And that is what you need the remedy to, isn't that what you are asking us to do?

Mr. EARL MARTIN. Right.

Mr. ROE. Give us that data, and we will go to work on it.

Mr. ROE. I do recall the instance on the floor, I remember the discussion in conference on this issue, and I am rather shocked it has gone in that direction. Why not give us that data then. We will need specific language though to help to remedy the situation and cure the problem, and we will need specific legislative language directing it be done.

We need other backup data from you, of course. So if you would submit that at your earliest possible convenience and we will by unanimous consent, with no disagreement, make that part of your formal testimony as of today.

The Chair recognizes the gentleman from Minnesota.

Mr. STANGELAND. One question on the failure of the plant to work. Has it been established beyond a shadow of a doubt that it was just a technology that was unworkable? Was it a problem in the design? Problem in the construction? Or was it just a theory or concept of EPA that proved to be totally unworkable?

Mr. EARL MARTIN. The concept was used for years as tertiary treatment. As secondary, it was an innovative process. The sludge coming through the primary treatment plant was too heavy for the carbon filters. So they blocked immediately. They were so heavy, they couldn't backwash them.

It still is a successful process for tertiary. It just didn't work without prefiltering.

Mr. ROE. Would the gentleman yield? Simply because we don't know, could that plant be upgraded to perform tertiary treatment? You are building the secondary plant now, I assume in the same area roughly speaking?

Mr. EARL MARTIN. Yes.

Mr. ROE. The question is—as the gentleman is developing it—would the process have worked if there had been a secondary treatment and then go to your tertiary?

Mr. EARL MARTIN. We have had engineers out of this area look at it, and they have indicated that the plant is not functional in that respect because it would need prefiltering which we cannot supply.

Mr. ROE. OK. You could have them—if the gentleman would yield further—you could have, I assume, and it would be helpful in your testimony, a report from the engineers to you saying for whatever reasons, technically that that plant that didn't work could not be made workable—see what I am driving at—so we can close the cycle technically is what I am trying to do.

August 19, 1977

Board of Cuyahoga County Commissioners
Division of Sanitary Engineering
75 Public Square
Cleveland, Ohio 44113

Attention: Mr. Stephen Sebesta
County Sanitary Engineer

Gentlemen:

Submitted herewith is our report on the evaluation of the existing Rocky River Wastewater Treatment Facilities. This evaluation, the last element of our work, has been prepared in accordance with our agreement dated July 19, 1976 as supplemented January 18, 1977. As you are aware, the majority of our efforts have been directed towards the R,D&D project and related construction administration advice to the County. Earlier letter reports on these other elements of our work are contained in appendices.

The major conclusions and recommendations of this report are as follows:

Conclusions:

1. The existing wastewater treatment facilities at Rocky River are inadequate to handle present sludge production and to provide secondary treatment for the existing wastewater flows.
2. Major modifications and upgrading of these facilities are required to provide adequate sludge handling and reliable secondary treatment.

INVESTIGATIONS • REPORTS • DESIGNS • ADVICE DURING CONSTRUCTION • ADVICE ON OPERATION
PLANNING • VALUATIONS • LABORATORIES • RESEARCH

3. Development of necessary modifications, including pilot plant work, is eligible for funding under Public Law 92-500. The upgraded facilities should include provision for plant expansion to serve the projected needs of the area.

Recommendations:

1. Prepare and submit an amendment to the scope and schedule of work for the Facilities Planning grant as outlined herein.

We would be most happy to meet with you and discuss the details of this report.

Very truly yours,

METCALF & EDDY, INC.

Francis D. Sampson

ACKNOWLEDGMENTS

We wish to acknowledge the assistance and full cooperation extended by the administrative and plant operating staff of the Office of the County Sanitary Engineer, Mr. Stephen J. Sebesta.

Cover photo and Figure 5 are by Mr. Paul Beck of the Office of the County Sanitary Engineer.

INTRODUCTION

Purpose

Cuyahoga County operates a wastewater treatment facility located in Rocky River which treats the waste from the cities of Bay Village, Fairview Park, Westlake and Rocky River. The process consists of an IPC (independent physical/chemical) treatment system, parts of which were designed and constructed under a R,D&D (Research, Development, and Demonstration) grant from the Environmental Protection Agency. The R,D&D project has been concluded (See Appendix A) and for the most part is not being operated. The operating portions of the plant are currently providing an intermediate level of treatment including phosphorus removal before discharge to Lake Erie. The County is required to upgrade the level of treatment to "secondary" under a permit issued under the National Pollutant Discharge Elimination System (NPDES) program.

The purpose of this report is to present an evaluation of the existing facilities and to outline certain actions necessary to satisfying final NPDES discharge requirements. It is expected that this report will serve as a basis for developing modifications and expansion to the existing facilities to serve the long range needs of the entire service area under Facilities Planning.

Scope

The scope of work consisted of a review in detail of all past correspondence, reports and other available information on

the existing facilities and the R,D&D project to the extent practicable; on site visitations by specialists, consultation with the County staff, representative of Schade and Associates and representatives of EPA.

The results of our evaluation of existing facilities are contained in the following report. Letter reports covering other aspects of our work are contained in the appendices. This report is not intended to satisfy all the requirements of facilities planning under PL 92-500 and certain modifications presented herein must be reviewed in the light of the long range needs of the service area.

DESCRIPTION OF EXISTING FACILITIES

General

The existing wastewater treatment facilities at Rocky River are shown in Figure 1. The original primary plant was abandoned and a new intermediate plant designed and built in 1959-1963. The "intermediate" level of treatment consists of chemical coagulation, settling and chlorination. The carbon adsorption system and other improvements to the existing facilities were completed in August of 1975. Major facilities constructed under the R,D&D project are those associated with carbon adsorption. A description of the plant performance has been presented*. The facilities shown in Figure 2 "as operating" provide an "intermediate" level of treatment with chlorination prior to discharge. The modifications to the pretreatment and to the flocculation-sedimentation tanks which were installed under the R,D&D project, are continuing to operate.

The intermediate treatment facilities were designed for an average flow of 16 mgd (million gallons per day). The carbon adsorption system was designed for an average of 10 mgd and a peak of 20 mgd. Present flows average 9-10 mgd, with reported peaks during rainfall in excess of 50 mgd.

With reference to Figure 2, raw sewage enters the plant through several interceptors that empty into a single influent

*"Full Scale Use of Physical/Chemical Treatment of Domestic Sewage at Rocky River, Ohio" presented at the Water Pollution Control Conference, Minneapolis, St. Paul, October 5, 1976.

FIG. 1 SITE PLAN

FIG. 2 EXISTING PROCESS DIAGRAM

chamber. There is an existing 54-inch bypass line that connects this influent chamber with the plant outfall downstream of the chlorine contact tank and Parshall flume.

Pretreatment

Pretreatment consists of two parallel trains consisting of Parshall Flume flowmeters, mechanically-cleaned screens, barminutors and aerated grit chambers.

The mechanically-cleaned screens are Jeffrey Catenary units with 2-1/2-inch clear openings between bars. The screens are located outside. The solids are discharged via a belt conveyor to a 2-1/2 to 3 cubic yard storage container.

Two barminutors are installed in the north pretreatment path and a single, larger barminutor, is installed in the south path. A Parshall flume is installed on each train just downstream of the barminutor.

The aerated grit chambers are equipped with a bottom screw conveyor and bucket hoist.

Coagulation/Clarification

The flow passes from the pretreatment facilities via an open channel to a distribution chamber located in the middle of the Clarifier Building. Flash mixing equipment is located in the distribution chamber. This mixing equipment is not being used. Instead, alum is added to the flow just before the grit tank overflow weir and polymer are added in the distribution chamber of the clarifiers.

The flow passes from the distribution chamber to four center feed, circular clarifiers (Figure 3) which are provided with flocculation facilities. These units originally contained preaeration equipment in the center section, however, this was removed during the latest construction program and flocculators were added.

The chemically coagulated, settled effluent is collected in an open channel and can be directed either to the chlorine contact tank or to the settled sewage pumping station and then to the carbon columns.

Filtration/Adsorption

The first component of the filtration/adsorption system, the settled sewage pumping station, contains two Gould horizontal double suction centrifugal pumps with space for a third pump. Each pump is driven by a 500-hp (horsepower) wound rotor motor with variable speed controls. The pumps are fitted with automatically controlled, cylinder operated butterfly valves and discharge to eight, rubber lined, carbon steel columns. The flow is metered by a master flow tube and is distributed by individual rate of flow controllers to each column. As shown in Figure 4 and 5 the eight carbon contact columns are each 16 feet diameter and 30 feet-8 inch high. Each column contains a 15 foot depth of granular activated carbon.

Multiple layers of gravel are located under the carbon and are supported by a Leopold tile underdrain system. Each

FIGURE 6

carbon contact column is provided with a rotating surface wash system located above the carbon and an air scour system which is located just above the support gravel. Carbon is removed from the column through four funnels that project through the gravel base. The air scour system consists of an 8-inch stainless steel air header with 10, 2-inch branches. Air diffusers are Eimco Type P nonclog diffusers spaced on 16 inch centers on the 2-inch branch pipe.

Associated with the carbon contact columns are a spent carbon storage bin, a regenerated carbon storage bin, a carbon regeneration furnace, associated pumps and equipment.

The carbon regeneration furnace (Figure 6) is a 6 foot outside diameter 5 foot inside diameter, eight hearth BSP furnace with an afterburner for odor control and a wet scrubber for particulate material.

Backwash and surface wash pumps utilize filtered effluent. The surface washwater passes through a Simplex, manually-cleaned strainer.

Motive water for carbon transfer is also taken from the filtered effluent.

Chlorination

Prior to discharge the effluent flows to two parallel chlorine contact tanks then to a Parshall flume and into a 1,500-foot outfall to Lake Erie.

Sludge Handling

Waste sludge is pumped from the flocculation-clarification process through a cyclone degritter and disintegrator into two gravity thickeners.

Thickened sludge may be pumped to either of two primary digestion tanks with fixed covers and then to a secondary tank with a floating cover, or directly to a sludge well preceeding the vacuum filtration process.

Supernatant from the digesters can be recycled for treatment in an aeration tank that is equipped with a submerged turbine aerator. Mixed liquor is clarified in a rectangular settling tank with return sludge and waste sludge pumped by an air lift pump to a division box.

Digested sludge or raw sludge is dewatered on two 8 foot by 8 foot Eimco Belt vacuum filters. Vacuum for both filters is furnished by a central vacuum system, employing lobe-type vacuum pumps.

The existing 13 foot-9 inch multi-hearth incinerator is not operating. Dewatered sludge cake is discharged to containers and hauled to landfill on a contract basis. Alternatively, all or a portion of digested liquid sludge is hauled and applied to farm land, also on a contract basis.

PROBLEM AREAS

General

As noted earlier, the R,D&D project has been concluded (Appendix A) and the carbon filtration-adsorption process associated with that project is presently not operating. However, the following discussion of problem areas is in the context of all the existing facilities shown in Figure 2.

The conclusion and shutdown of the R,D&D project is the direct result of the failure of the carbon filtration/adsorption system. Therefore, certain problems with this system must be corrected before these facilities can be placed back in operation. Further, the entire existing waste treatment system at Rocky River should be evaluated in light of the long-range needs of the service area.

Major problems surfaced in connection with the R,D&D project which caused the County to question its continuation. These problems have been described elsewhere* and consist of intermittent severe odor problems in the effluent from carbon columns, inability to process the entire design flow (10 mgd average/20 mgd peak), deterioration of the air scour system, major losses of carbon, inability to manage the sludges produced within the entire treatment system and failure of the carbon column rubber lining system.

*"Full Scale Use of Physical/Chemical Treatment of Domestic Sewage at Rocky River, Ohio" presented at the Water Pollution Control Conference, Minneapolis, St. Paul, October 5, 1976.

The major problems noted above are symptoms of other problems, some of which are process considerations, others equipment limitations. Even with the R,D&D project terminated certain problems persist, most notably in the area of sludge handling and disposal.

In the following sections, specific problems are discussed. Subsequent sections deal with the recommended actions to be taken by the County. A preliminary schedule and the financial implications of these recommendations are also presented.

Process

The major process problems can be summarized as follows:

1. Lack of backwash water equalization facilities and standby carbon adsorbers.
2. Inadequate sludge management system.
3. Combined filtration/adsorption in a deep carbon bed.

These are discussed sequentially and in detail in the following sections.

Originally, it was expected that each column would be backwashed at 15 to 20 gpm/sq. ft. (gallons per minute/square foot) or 3,000 to 4,000 gpm for 10 to 15 minutes and that backwashing would occur at periods of low flow (night shift).

During one week in February, backwash water use increased to approximately 4,000 gpm for 30 minutes while the air scour system was operated for 10 to 15 minutes per column each day. It was also necessary to backwash during the day shift with supervisory personnel.

As originally contemplated, the total daily waste washwater recycle volume (assuming daily backwash) for eight columns would be 240,000 to 480,000 gallons. At the required higher rates the recycled volume was approximately 1,440,000 gallons. This amounted to an increase of from 2.4 percent of the 10 mgd average daily flow to 14.4 percent.

The effect of backwashing at a rate of 4,000 gpm (5.76 mgd) on the performance of the clarifiers is significant. Data from operation of the coagulation/clarification facilities prior to buildup of solids in the system and increased backwash requirements, showed these facilities capable of producing suspended solids concentrations in the acceptable range of 30 to 50 mg/L (milligrams per liter). With the increased backwashing requirements clarifier surface loadings increased from design average of 600 and maximum of 1,200 gpd (gallons per day) per square foot to 900 to 1,500 gpd per square foot, respectively, if backwashing were not performed at night. These maximum rates are above commonly accepted design limits. The high average rate and more importantly, the surges in flow result in significant carry-over of suspended solids to the carbon system, a critical matter in combined filtration and adsorption. This problem is aggravated further at Rocky River when, during periods of rainfall, flows of 50 to 60 mgd have been reported.

More significantly, the carbon column surface loading rates increase from 4.3 gpm/sq. ft. design average values with

all eight columns on line up to 7.8 gpm/sq. ft. design average values with seven columns on line (i.e., one in backwash). At the peak design flow of 20 mgd flow the loading rate on seven columns is 12.8 gpm/sq. ft.

Similarly, the empty bed contact time is 26 minutes, if all eight columns are on line at an average design flow of 10 mgd. Recycling waste backwash water with seven columns on line, the contact time would be reduced to 14.4 minutes.

Accepting, for the moment, a maximum surface loading of 8.6 gpm/sq. ft. and recognizing that backwash requirements (and recycle load) are a function of solids loading, the impact on capacity resulting from lack of backwash equalization and standby adsorbers can be significant as shown in the following:

> Assume two (2) columns out of service, one under backwash and one in regeneration. The maximum hydraulic capacity of the remaining six (6) columns at the design rate of 8.6 gpm/sq. ft. is 14.8 mgd. With 5.76 mgd recycle, the rated maximum capacity for sewage flow is 9 mgd versus the 20 mgd design. Nominal capacity becomes 4.5 mgd versus the 10 mgd design average.

The foregoing is for example only and to illustrate the need for equalization and standby adsorbers.

The additional solids to the carbon system produced primarily by inadequate sludge management necessitated more frequent and lengthy backwashing. This has aggravated many other problems.

The results of inadequate sludge management during the operation of the carbon facilities has been documented elsewhere.* Simply stated, more sludge was produced than removed from the system.

Sludge management consists of processing sludge and arranging for its ultimate disposal. As shown in Figure 2, three options for disposal are available: incinerator ash to landfill, sludge cake to landfill and digested liquid sludge to land application. The choice of one option over another is principally economic, environmental constraints notwithstanding. The incinerator option is unavailable due to mechanical problems as outlined later.

Experience at Rocky River and elsewhere has indicated that vacuum filter yields 2 to 3 psf/hr (pounds per square foot per hour) are typical for chemically (alum) coagulated sludges versus the expected 6 psf/hr. In that most of the solids are generated in the coagulation/clarification step, the problem of additional sludge handling persists even with the carbon system out of service. At reported sludge production, which compares favorably with estimated quantities, the vacuum filters should be operated three shifts per day, five days per week to keep pace. This would not allow for downtime. Equipment, repair, insufficient sludge cake storage and lack of operating personnel has reduced vacuum filter operating significantly in the past and resulted in buildup of solids inventory.

*"Full Scale Use of Physical/Chemical Treatment of Domestic Sewage at Rocky River, Ohio" presented at the Water Pollution Control Conference, Minneapolis, St. Paul, October 5, 1976.

Land application of liquid sludge has shown recent promise of providing backup capability to catch up with production reportedly at reduced costs, compared with sludge cake to landfill. However, either way, sludge disposal costs remain quite high.

A reevaluation of combined carbon filtration/adsorption is warranted under facilities planning, especially from a system subject to inflow. As discussed earlier, surges due to inflow cause upsets in the quality of the settled effluent of the chemical coagulation process thereby imposing additional solids loads on the downstream systems.

As shown in Figure 4, filtration/adsorption is accomplished within 15 feet of granular activated carbon. A critical design and operating parameter for wastewater filtration is the length of filter run. All other things being equal, the length of run is a function of the solids concentration, hydraulic loading rate and the range of operating pressure.

As solids build up in the filter, pressure loss increases to some predetermined maximum whereupon backwashing commences.

Due to the excessive solids load described earlier, and in order to attain reasonable filter runs, the system was operated at differential pressures across the carbon of more than 30 psi* (pounds per square inch) versus the intended 5 psi. At the higher operating pressures, solids are driven deep into the filter. It is imperative that a wastewater filter be thoroughly backwashed

*Note: Pressure gages ineffective due to plugging with carbon.

to remove accumulations of solids. However, in a deep filter packed with solids, effective backwashing is difficult at best. Organic solids not removed in backwashing provide added support for biological growth and formation of H_2S odorous conditions.

Experience on wastewater filtration (1 to 4 feet of single, dual or mixed media) in conventional systems has shown maximum hydraulic loading rates of 6 to 8 gpm per square foot produce reasonable filter runs, control odors and minimize backwash requirements. Given the solids loading from a frequantly overloaded coagulation/clarification step and using combined filtration/absorption in a deep bed, design hydraulic loadings in excess of 6 gpm/sq. ft. seem unadvisable. Based on these lower (6 versus 8.6) maximum rates then derating of the nominal capacity of the existing filters would result even with equalization and standby adsorbers. It is obvious the extensive pilot work is required to establish a basis of design for the combined filtration/adsorption system at Rocky River as discussed subsequently.

Equipment Problems

The following is a description of the mechanical, electrical and other problems listed during our inspection and of the existing facilities. These will be described by treatment system.

Pretreatment. The mechanically-cleaned screens and conveyors are located outside and freeze-up during winter operation. Infra-red heaters have been installed above the belts, but the problem remains.

The screen high level alarm is a local alarm only. It is not connected to an area that is alway attended.

The screening building is poorly ventilated and considerable corrosion is in evidence.

There is no interconnection between the two parallel pretreatment trains. If one unit is out of operation the entire train is lost.

Both pretreatment systems are used during storm flow only. At peak flows head loss across the mechanically-cleaned screens is reported to be 2 feet and another 18 inches across the barminutors. The head loss across the barminutor causes so much turbulence that it affects the mechanical float of the Parshall flume.

The bubbletubes for automatic operation of the screens are copper tubing and subject to damage.

The uninsulated standby generator engine exhaust creates a safety hazard.

The aerated grit chambers are not optimal in regard to grit removal. Consideration should be given to abandonment when upgrading in view of the redundant grit removal system available on the primary sludge system.

Coagulation/Clarification

The existing coagulation/clarification facilities (originally primary clarifiers) are designed for an average of 16 mgd. To provide good solids capture and phosphorus removal maximum overflow rates should be 1,000 to 1,200 gpd, including

recycle. Neglecting recycle, these facilities would be adequate for a maximum flow of approximately 20 mgd. Reported peak flows in excess of that amount can create solids carryover.

The present system of alum addition consists of a small diameter pipe with small orifices hung horizontally above the aerated grit chamber effluent weir. While some initial mixing occurs in the fall over the weir complete mixing is not ensured. The wastewater flow then travels through a channel to a central mixing chamber between the four clarifiers. The flow in the channel is shallow and unaerated. As a result, little mixing occurs after the initial drop over the grit chamber weirs.

Within the clarifier control building a central mixing well and division box was provided in which polymers are added. This chamber is equipped with a variable speed rapid mixer. The unit is no longer used. It is reported that the power input and speed were excessive resulting in floc shearing and lower suspended solids capture.

Good mixing is important to optimize alum usage for phosphorus removal and should be reevaluated in upgrading.

Carbon Filtration/Adsorption

Settled Sewage Pumping Station. The major problem in the settled sewage pump station involves the relationship between the pump control system and the control system for distribution of flow to each of the carbon columns.

The present arrangement provides two level controllers in the wet well. One level controller controls the pump speed

and thereby the capacity in proportion to wet well level. The second level controller controls the individual carbon column rate of flow controls to evenly distribute the flow between the operating columns. Modifications to solve this problem have been designed,* but were not incorporated into the present facilities as a result of carbon shutdown.

Operating tests made during Metcalf & Eddy site inspections and subsequent field measurements by plant staff indicate that the pump rating curves understate capacity (Appendix B). Depending on the projected flows and upgraded control system, the impellers may require further trimming to reduce capacity to original design levels.

Two other problems were noted. First, there is no isolation valve downstream of the butterfly valve so that if maintenance is required on the butterfly valve, the whole carbon adsorption system must be shut down. Secondly, the arrangement of the future pump is such that the suction piping will be parallel to the shaft. This arrangement will put an unbalanced load on the pump bearings.

The building heating system is inadequate.

The booster pump on the seal water system is not needed and should be removed. The settled water pumps are double suction pumps so the packing is subject to suction pressure only.

*Change Order No. 10, May 19, 1976.

Carbon Columns

The major and most obvious problems in the carbon columns are the failure of the rubber lining and air scour system and loss of carbon through the underdrain system (See Figure 7).

The rubber lining failure has been discussed in a separate letter report (Appendix C). Modifications and expansion should consider lining systems other than rubber versus repair depending on process considerations and final selection of a carbon contacting mode.

The 150-hp blowers used for air scour are rated at 1,675 cfm (cubic feet per minute) at 15 psi (pounds per square inch). Discharge temperatures have been measured in excess of 190 deg F. This caused distortion of the Eimco plastic diffusers and allowed the air piping to become filled with carbon.

The stainless steel nuts that hold the diffusers in place are badly corroded. However, the stainless steel bolts are not corroded. This could be caused by the elastomer used to hold the nut in place or by use of a different stainless steel for the nut.

Sound level readings taken show that the compressor have an excessive noise level. In the Operator's Office on the floor above the compressors the reading was 103 DBA. At the entrance to the compressor room the reading was 128 DBA. Protective ear covering is required above 115 DBA.

The controls for starting the lobe-type positive displacement compressors require modification. The automatic unloading

METCALF & EDDY

CARBON COLUMN - LINING FAILURE

BOTTOM OF CARBON COLUMN - NOTE MIXING OF GRAVEL AND CARBON

FIGURE 7

20-955 O—84——43

valve closes in approximately 18 seconds but the valve to the carbon columns air piping does not fully open for one minute. As a result the pressure relief valve on the blowers has been opening. This could be caused by improper valve opening speeds or by the increased pressure loss in the air piping caused by plugging the pipe with carbon.

The compressors are installed in a small area that originally was intended to be a storage area and space for maintenance is inadequate. If it is required to remove the rear compressor, it will have to be disassembled. No ventilation has been furnished for this basement space. If the compressors are operated for extended periods, overheating will be a problem.

Field investigation by plant staff and Metcalf & Eddy indicate that the loss of carbon from the adsorber was through the filter underdrains and the support gravel system as shown in Figure 4, 5 and 7. The existing gravel is 8 inches deep which is less than that currently recommended for a Leopold underdrain system. As indicated in Figure 7, the carbon withdrawal funnels project through and above the gravel support. This arrangement creates excessive rates of flow of backwash water around the perimeter of each funnel. These excessive flows caused displacement of the gravel thereby leaving a void which has allowed gross loss of carbon along the underside of the funnel to the underdrain system. No obstruction to flow through underdrain gravel can be tolerated since it can cause localized

increases in flow which can fluidize the gravel and result in mounding of the stone, thus opening a direct passage for the carbon to enter the Leopold underdrain tile.

Major modifications to the carbon removal system and the carbon filter underdrain system must be made to eliminate loss of carbon from the column. Some alternatives to be considered are:

1. Redesign of gravel to 12 inches in thickness utilizing four layers with the top layer consisting of a high density gravel of garnet or limenite.
2. Redesign the gravel using 12 inches which would consist of four layers and use a stainless steel mesh and anchors to retain the gravel in place.
3. Eliminate the gravel, remove the Leopold underdrain system and install a nozzle underdrain system for an air-water wash backwash system.

All the above modified underdrain systems include redesign of the carbon removal system within the adsorber.

As a result of the carbon in the effluent the impellers of the surface wash pump have had severe corrosion and/or erosion so that the pumps no longer discharge their rated capacity.

The effluent water strainer is frequently plugged and must be manually cleaned.

Carbon has been found throughout the piping system and has plugged the surface wash nozzles. Carbon has plugged and possibly

eroded the carbon column flow controller. The rate of flow controllers should be inspected for wear due to carbon abrasion before recommissioning.

These problems will be minimized or eliminated when corrections are made on the columns to prevent the loss of carbon.

Carbon Regeneration

The eductor used for transferring carbon becomes plugged with solids, and a temporary screen is used to prevent plugging. Process modifications to prevent solids carryover and possibly a larger eductor should correct this problem.

The transfer piping becomes plugged and there are an inadequate number of flushing connections to facilitate clearing the system.

Means of controlling the flow of the motive water pumps has not been provided. Below 3.5 feet/second the carbon settles out and above 10 feet/second the abrasion is excessive. Controls should be provided to keep the velocity within acceptable limits.

A spill containment area has not been provided. Additional controls should be provided to assure that the system is operating as intended, such as carbon level sensors, etc.

The gaskets in the transfer piping blow out under pressure and should be modified.

The following comments pertain to the regeneration furnace area:

1. Provide safety goggles and asbestos gloves for work around the hot furnace.
2. Provide fire fighting capability, extinguishers, etc.
3. The alarm for the furnace cannot be heard on the operating floors when the door to the control room is shut.
4. A flue gas bypass is not provided. In the event of an induced draft fan failure, scrubber water pump failure, or power failure, the operator has no means of controlling the combustion process except to shut off all sources of air to the furnace. The absorbate on the spent carbon is highly combustible then the gasses released may come through the furnace doors creating a fire hazard, also, the high temperatures will damage the scrubber.
5. The center shaft drive and cooling air fan should be connected to an emergency generator to protect the furnace in the event of a power failure.
6. An emergency scrubber water supply should be provided to protect the scrubber.
7. An alternate means of escape should be provided from the upper level.
8. Platform access is inadequate to properly maintain the equipment, especially the burners on the lowest hearth and the center shaft drive and cooling air fan.

9. The burner control boxed around the furnace appears to be inadequate to prevent moisture accumulation on the controls during long periods of shutdown.

Carbon Column Building

A heating system was installed in the Operations Room of this building. Infra-red heaters have been installed in the Column Room, but these are not effective and ice has formed on the floor.

The Column Room is furnished with roof exhaust fans for summer ventilation, but there is no provision for winter ventilation. This condition is a problem, especially when odors are present.

The Operations Room and the Storage Room above it that has been converted to an office have fixed windows and are unbearable during summer months. The office does have a small exhaust fan that is ineffective because of the fixed sash.

A heating and ventiling system should be provided in this building and the office and Operations Room should be air conditioned.

All sump pumps in the Carbon Building are of the vertical, extended shaft drainage type pumps and are not nonclog pumps. These pumps should be nonclog submersible pumps. Carbon has damaged the existing pump bearings.

The pumps are not connected to the standby power. On power failure, it is possible to flood the dry well.

The control system includes only a single compressor.

No high water alarm is installed. The pumps have become clogged and flooded the dry well without an alarm being given. This alarm should be transmitted to a central point.

Sludge Handling

In addition to the problems previously discussed, certain other problems noted are as follows:

The plant operators have experienced problems in keeping the vacuum filters in continuous operation. This problem is caused by the inability of the filtrate pumps to run continuously.

Vacuum for both filters is provided by a common receiver, vacuum and filtrate pump system. During operation, the filtrate pumps have completely emptied the filtrate from the receiver and have become air bound. When the pumps are air bound the receiver fills with filtrate, eventually shutting down the vacuum system.

Piping and/or pump modification will be required to provide reliable filtrate pumping.

Appendix D describes the problems with the existing sludge incinerator.

Grit is removed from the sludge from the clarifiers with a cyclone grit separator. The separated grit is cleaned in a grit classifier. Grit is discharged from the classifier into a hand cart for removal from the plant.

The present grit classifier does not have wash sprays installed on the head portion of the classifier. The efficiency of the classifier in removing volatile solids from the grit may be improved by the addition of these sprays.

The location of the grit separator and the hand cart for grit removal is at the farthest point in the building from the truck dock. It is extremely difficult to manhandle a heavily loaded grit cart from this location to the truck dock for removal. The materials handling system for the grit is inadequate and, to some extent, creates a safety hazard.

Either the grit separator system should be relocated to a more accessible point, or a materials handling system for the grit should be provided.

Chlorination

Only one chlorine injector water pump has been installed. If this fails there is no chlorination. A second pump must be installed for standby duty of this vital pump.

The chlorine injector water pump motor is operating with a 15 percent overload (the motor has a 1.15 SF). The pump pulls its full rated 10 hp at the rating point of 100 gpm at 200 feet, but the pump operates at about 160 feet TH. The existing 10-hp motor should be replaced with a 15-hp motor.

Only a single evaporator is furnished for the two chlorinators. A standby evaporator should be furnished.

Electrical

The Digester Building usually treated as a hazardous area has considerable electrical equipment not explosionproof. A gas detecting system should be installed (as soon as possible) providing an alarm and energizing of ventilation equipment on detection of gas. This also could apply to Screening Building.

The electrical distribution system has one incoming line only and no emergency generator power for major pumping facilities. In addition, the distribution system within the plant has no flexibility due to subfeeding of power. For instance, if power is lost to the Settled Sewage Pump Station, all power is lost at the Carbon Building. If power is lost to the Filter Building (single 4,340 volt underground and overhead line terminated in a single transformer at filter building) all power is lost to the remainder of the plant. Any future design should provide a completely new distribution system incorporating some form of secondary selection.

ALTERNATIVES

General

From the foregoing, major modifications to the existing facilities will undoubtedly be necessary if the County is to provide secondary treatment for all existing wastewater flows. While the specific physical/mechanical problems outlined will require correction, the main considerations in upgrading are the process problems. To avoid wasteful expenditures, solutions to these problems must consider both present and future wastewater flows (needs).

The development of alternatives for upgrading existing facilities is done in a facilities planning study. Such studies including any pilot plant work, are eligible for Federal grants amounting to seventy-five (75) percent of approved costs. The facilities planning process includes consideration of wastewater treatment and sludge management alternatives from engineering, environmental and socio-economic perspectives. It culminates in the recommendation of the most cost-effective alternative. As noted in our letter dated October 13, 1976, (Appendix A) the plan of study contained in the county's Facilities Planning grant application includes consideration of modifications to the existing facilities. However, it is not explicit as to the scope of work, especially pilot plant work.

The development and study of alternates for upgrading the Rocky River Plant is complicated by the existence of facilities of widely varying utility with respect to present

and future flows. Some perspective on the problem can be gained by comparing the present average flows of 9 to 10 mgd (projected flows of 15 mgd have been mentioned) to: coagulation/clarification rated at approximately 10 mgd average; carbon filtration/adsorption unknown and sludge handling inadequate for present production.

Alternatives

The following discussion is not intended as an exhaustive development of alternatives but as an indication of the breadth of such studies to be done under Facilities Planning. In evaluating alternatives, operating and maintenance costs and reliability must be weighed along with capital costs considerations. When treating municipal wastewater, IPC facilities usually reflect a higher operating cost than conventional biological systems.

The two main process considerations in upgrading are, reevaluation of combined filtration/adsorption and the development of a cost effective sludge management program. It can be safely predicted that backwash water equalization and standby adsorbers will be a part of any upgrading.

The major alternatives for liquid waste treatment are:

- Upgrading and expansion of entire plant as independent/physical chemical,
- Utilize upgraded existing carbon facilities to treat portion of flow; expansion provided by biological process,
- Abandon carbon facilities and provide biological secondary treatment.

These are shown in Figures 9, 10 and 11. The last alternate is unlikely due to the existence of a sizable investment in the present facilities. However, it should be included in initial screening and cost comparisons.

Primary emphasis would be to maximize the utilization of existing facilities. Any departures would have to be justified on the basis of cost. The limited space for expansion was a prime consideration in the original decision to employ IPC at Rocky River.

Carbon adsorption for removal of BOD (biochemical oxygen demand) can easily meet effluent standards. In addition, suspended solids must be reduced from that which can be produced by the chemical coagulation/clarification process. It would appear that the downflow carbon filter adsorber would have the potential to provide both services, i.e., filtration to lower suspended solids and adsorption to remove soluble organics in one unit operation. However, as discussed earlier, operating experience indicates that there are problems with this combined process system. In addition there are serious questions regarding cost effectiveness.

Therefore, if carbon treatment is to continue and in order to minimize operation problems, conventional dual or mixed media filters should be considered prior to carbon adsorption as an alternate to combined filtration/adsorption. Separate filtration could be a cost-effective method of reducing the solids loading on the existing carbon columns and improving total system performance. Separate filtration would also allow operation of

FIG. 9 SPLIT TREATMENT PROCESS DIAGRAM

FIG. 8 IPC TREATMENT PROCESS DIAGRAM

FIG. 10 CHEMICAL/BIOLOGICAL TREATMENT PROCESS DIAGRAM

carbon in the upflow expanded contacting mode. Filters may be of the gravity downflow or pressure type and experience indicates that suspended solids of less than 10 mg/L may be readily obtained. However, the capability of a filter to remove suspended solids is dependent upon the quantity and type of solids introduced into the filter.

The type of filtration system selected will depend upon the capability of a media to remove the suspended solids and capital and operating costs of the entire system. Comparative analyses, including pilot work, should be made of gravity downflow, pressure filters and combined filtration/adsorption to develop basic design data and determine the most cost-effective installation. Each system has certain characteristics which must be considered. For example, for wastewater filters, there is an advantage to utilize open filters to allow ease of cleaning and maintenance of the media and related equipment.

One of the critical operating criteria for wastewater filters is the length of filter run. It is desirable to obtain as long a run as possible in order to minimize the frequency of backwashing and, therefore, the amount of waste backwash water that must be recycled or treated in a separate process. The length of filter run of a gravity downflow filter is limited by the depth of water over the media in the filter box, whereas the length of filter run for a pressure filter may possibly by extended due to the availability of additional head. However, the increase in length of filter run possible for a pressure filter is not totally a function of head loss and depends on the

time that breakthrough of suspended solids will occur from the filter media. This, in turn, depends on the design of the filter media. The resistance of a media to breakthrough is a function of the design of the media and should be predicted based on pilot studies.

An alternate to separate filtration would be upflow/downflow carbon contacting.

Odor control will be a major concern in either a biological or physical/chemical treatment system. For example, separate filtration will not eliminate potential odor problems from carbon column and odor control in sludge handling systems is increasing.

Sludge management is of primary concern at any wastewater treatment facility. Sludge management consists of the facilities for processing sludge and arranging for their ultimate disposal. Alternate ultimate disposal of wastes must be considered in detail during the facilities planning process. In-depth environmental studies of land application are necessary to assess its long-term viability for all or a part of the sludges. Co-handling with solid wastes must also be evaluated.

The costs reported by the county for landfill of sludge cake and land application of liquid sludge of over $100 per ton of dry solids are quite high suggesting a reexamination of the use of the existing incinerator. Dewatering techniques to allow autogenous combustion and heat recovery could reduce sludge handling costs considerably from reported costs levels.

20-955 O—84——44

The ultimate disposal options should be reviewed early in the facilities planning process to allow, if practicable, accelerated construction of much needed improvements to the existing system.

If incineration is cost-effective the use of anaerobic digestion would be discontinued. The existing digestors could serve usefully as sludge storage facilities to reduce peak load and provide added operational flexibility.

RECOMMENDED PROGRAM

In order to satisfy the requirements of the NPDES permit and serve the wastewater treatment needs of the area it will be necessary to undertake engineering studies leading to a recommended alternate.

It is recommended that these studies be funded as Step 1 work under PL 92-500 and conform to the requirements for facilities planning. This will maximize grant participation for implementation. The financial implications of grant participation are significant, while very preliminary, total costs for upgrading and expansion to 15 mgd (average) capacity could be in the range of 15 to 20 million dollars.

While short-range improvements may become evident upon further study, comprehensive planning is mandatory to avoid wasting of funds, both capital and operating. The major short-range objective should be for improved sludge handling. It is imperative that staffing and financial support be available for sludge handling and disposal.

The detailed scope of work and associated costs should be prepared by the consultant selected to conduct the expanded facilities planning work. Any expansion of scope must be integrated with the ongoing facilities planning effort especially the I/I (infiltration/inflow) analysis.

However, as a minimum the study should include:

- coordination and finalization with ongoing facilities planning of present and future wastewater quantities and characteristics.
- preliminary screening, using known design parameters, of alternative upgrading techniques; the objective being to establish a pilot plant program capable of producing necessary design data for the most viable alternatives. Evaluative factors should include; reliability, space requirements, capital and operating costs and state of the art.
- design, construction (by others) and operation of approved pilot plant work. It is expected that at least two (2) process configurations would be piloted using one or two of the existing carbon columns appropriately modified.
- economic and environmental evaluation of alternate sludge handling and disposal techniques.
- final screening and evaluation of selected alternates on the basis of pilot work. This evaluation should consider phased implementation capabilities and maximum utilization of existing facilities.
- planned public participation in the selection process, including full disclosure of capital costs, total and local shares, and operating and maintenance costs, environment assessment and other related factors.

FIG. 11 PRELIMINARY SCHEDULE

- development of an implementation schedule with recommendations for acceleration of immediate needs under the provisions of 40 CRF 35.917(d).

Based on our past experience and to allow sufficient time for planning, review and funding, a preliminary schedule is shown as Figure 11. A request for amendment of the present Step 1 work should be made, along with appropriate revisions to the schedule.

Respectfully submitted,

Subject: Rocky River Summary Report

Dear Mr. Sebesta:

In accordance with our agreement and our most recent discussions this letter is intended to summarize our involvement in the Rocky River R&D project in accordance with our agreement dated July 19, 1976. The purpose here is to; present the background at the time of our involvement, describe the major problems that were perceived at the onset and remain as such and present our major conclusions and recommendations based on the work to date.

Background

General. Our involvement in the Rocky River project began in July of 1976. At that time the County was in the midst of a Research and Demonstration project under a grant from the Environmental Protection Agency. The project involved the demonstration of the use of coagulation and settling in conjunction with granular activated carbon filtration/adsorption as an alternative to conventional biological secondary treatment. The NPDES (National Pollution Discharge Elimination System) Permit issued to the County required implementation of the equivalent of secondary treatment by September 1, 1976. This permit is typical of permits being issued throughout the Countby to all discharges in conjunction with Public Law 92-500 and is independent of the Research and Demonstration project per se. The permit, however, ties the starting date for the required secondary effluent to the successful startup and operation of the R&D project. Interim requirements are presently in force.

INVESTIGATIONS • REPORTS • DESIGNS • ADVICE DURING CONSTRUCTION • ADVICE ON OPERATION
PLANNING • VALUATIONS • LABORATORIES • RESEARCH

The R&D project is multifaceted and the details are contained in the original application and the various amendments made thereto over the project period. The two major facets of the project are the construction of the treatment facilities and the operation and analysis of performance. The Spohn Contract No. 1 had not been accepted at the point of our involvement. Serious physical problems including lining failures, carbon losses and mechanical failures had raised questions regarding continued operation of the carbon system.

The scope of our services was to provide consultation and advice to the county regarding the identification and resolution of major problem areas.

Major Problem Areas - The major problem areas can be grouped into three categories in order of priority:

1. Contract administration

2. "The R&D Project"

3. The NPDES Permit

Approach to Problem

Our approach to the problem has been to review, in detail, all past correspondence, reports, and other available information to the extent practicable and through on-site visitations by specialists, in depth consultation with the County, including the plant operating staff, representatives of Schade and Associates, representatives of EPA to get as clear a picture as possible of past events. The complexity of the situation needs little elaboration and while we have broken the major problems into three categories, none are entirely separate. It is for the purpose of attacking these problems and finding resolutions that these categories have been established.

It must be recognized that the introduction of an outside consultant represents some problems in and of itself. Problems which cannot be overlooked in the resolution of the above outlined issues. It is our intent, clearly stated at the onset of our work with the county, that we will deal with the issues and report objectively to the County in the form of confidential letter reports on these issues in a timely way. Similarly, that the County's approach, as conveyed to us, was to find solutions to these problems, if at all possible, short of litigation. Further that recommendations regarding litigation would not be made by Metcalf & Eddy, nor are any implied by this letter or previous letters.

Summary of Conclusions and Recommendations

The three major problem areas are discussed in detail in separate appendices. In summary, our major conclusions and recommendations are that:

Contract Administration

- Contract No. 1, Spohn Corporation, with the exception of the items on the attached final punch list, has been built in substantial conformance with the contract plans and specifications.

- a semi-final estimate should be issued on said contract; final estimate and extension of time shall be held in abeyance pending resolution of the rubber lining failure.

- the contractor with Uniroyal and Protective Coating provide data satisfactory to the County to show that the rubber linings were installed in strict accordance with manufacturers' recommendations.

- that arrangements be made for "mothballing" the carbon facilities for an indefinite period. Such procedures should include the recommendations of manufacturers of electrical and mechanical equipment.

R&D Project

- the granular carbon filtration/adsorbtion facilities cannot be operated without major modifications to the entire plant, the rubber linings notwithstanding.

- the costs to provide an operable facility would be high, with little prospects for further funding under the R&D program.

- there is no benefit for the County in continuing the R&D project per se. Additional pilot plant work should be coordinated with Facilities Planning (201) required under the NPDES permit.

- the results of the R&D project to date are a significant contribution to the state-of-the-art of wastewater treatment.

- the R&D project be terminated as soon as is practicable. Further that termination negotiations with EPA provide that any unapplied grant monies be applied to termination costs and past completed work to maximize grant participation on total project costs.

NPDES Permit

- the County must provide the equivalent of secondary treatment for all wastew discharged from Rocky River. The schedule can be negotiated in connection with the Step 1 application.

- In order to comply and be eligible for grant assistance the County must perform Facilities Planning consisting of consideration of long range needs, reduction of infiltration/inflow and selection of the most cost-effective waste treatment system including ultimate sludge disposal.

- that the recommended improvements to the existing facilities be incorporated in any upgrading and expansion of the Rocky River wastewater treatment facilities.

If you or the Board have any questions on these conclusions and recommendations, we would be most happy to meet and discuss them.

Very truly yours,

METCALF & EDDY

Subject: Report on Final Inspection
Rocky River Wastewater Treatment Facilities

Dear Mr. Sebesta:

During the week of September 14, 1976, a final inspection of the Rocky River Wastewater Treatment Facilities, constructed by The Spohn Corporation under Contract 1 and Change Orders 1, 3, 6, 8 and 10 to that Contract, was conducted by a team of four specialists from our staff. Our inspection was limited to Contract 1 since we understand final estimates to have been issued and Contracts 2,3,4 and 5 in this project closed out by the County prior to our involvement. Where specific deficiencies were uncovered, however, e.g. some electrical items, they are noted as such. The purpose of the inspection and tests was to determine the degree of compliance of the work performed by the Contractor with the original Contract Plans and Specifications, as modified by authorized Change Orders and shop drawings approved by the County. This inspection was preceded by several visits to the site and considerable effort in this office by the members of the inspection team and others of our staff, Meetings with County personnel and the Contractor, and the collection and review of data, all necessary to define the problems and to review the history of the Contract administration to this point in order to establish a procedure for a complete and efficient final inspection. The process included a review of all approved shop drawings for the necessary detailed information on equipment furnished. The inspection was restricted to some degree in that certain of the processes and equipment were inoperable at the time of the inspection; however, the County Plant Operations staff provided their observations of the functioning of these systems and equipment when they were operating, enabling us to make judgments as to whether or not the equipment appeared to meet the contract requirements.

In general, the testing procedure was to operate all equipment, take performance data on as much equipment as possible to determine compliance with approved performance requirements, megger circuits, and to determine current loadings on motors under actual operating conditions. Other equipment and materials were inspected visually for compliance.

The inspection covered the following in each area.

Headworks

Coarse bar screen cleaner and controls, screenings,conveyor, canopy with heaters, standby generator, grit collectors, and recycle flow piping.

Clarifier Area

Distribution chamber mixer, clarifier alterations, chlorine injection water pump and piping, chlorine evaporation, chlorine pressure reducing valve, scum pipe insulation and heating and chlorinator rotometers and electric pacing equipment.

Settled Wastewater Pumping Station

Pumping equipment and controls, overhead crane, heating and ventilating, water seal system, and sump pumps.

Carbon Building

Carbon columns, instrumentation and controls, backwash system, surface wash system, air backwash system, carbon transfer system, regeneration furnace, jib crane, traveling crane and building services.

Sludge Thickening

Inlet splitters box.

Digesters

Valves and piping.

Supernatant Treatment System

Aeration tank and equipment, settling tank and equipment, sludge holding tank and pumps and line handling equipment.

Sludge Process Building

Sludge degritting and disintegrator, jib crane, scum processing equipment, chemical storage tanks and chemical feed system.

Site Work.

Roadways, grading and power distribution.

Attached is a punch list, tabulated according to Contract Item Numbers, listing those items found not to be in compliance with the approved Contract Documents. As we have discussed, the punch list should also include any items of Contract administration not yet fulfilled by the Contractor, such as subcontractor payrolls and insurance certificates outstanding, as well as any operation and maintenance manuals required by the Contract Documents not yet received, the provision of the services of manufacturers' representatives for start-up and instruction of operating personnel which may not yet have been completed, and any other miscellaneous items to be settled, such as the cost of temporary heat, for which the Contractor may be liable. A specific list of these requirements still outstanding can best be generated from your own records and appended to the punch list.

A major item of uncompleted Contract administration is the matter of an extension of the Contract time for completion. We understand the original time for completion to have expired on July 28, 1974, and the date of substantial completion and at least partial beneficial occupancy by the County to have been August 18, 1975. At the very least, the Contractor is liable for the assessment of liquidated damages through August 18, 1975, unless and until a time extension to that date is granted by the County. We understand that the Contractor has filed a request for an extension of time, but that it has not yet been acted upon.

With the exception of those items listed, and including reliance on the observations of County personnel coupled with our visual static inspection as the basis for our assessment of that equipment not now operable, we believe all other work performed under the subject Contract to be substantially in compliance with the Contract requirements.

Before finalization of the punch list and its presentation to the Contractor, we believe it most important that Schade Associates review the list and that their comments and any additions thereto be incorporated.

As you know, essentially all of the items on this punch list were read to the Contractor at our meeting on September 29, 1976, and none appear to present any real problem with the exception of the matter of the rubber linings; that is, we expect that the Contractor will correct all other deficiencies forthwith or that in some cases, such as the substitution of smaller nozzles for those specified, a cost difference should be assigned and taken as a credit against the total Contract cost.

The rubber linings are another matter. To date, only three of the columns have been emptied and inspected, and the remaining columns must be emptied and inspected in order to completely quantify this issue. We have listed the linings as a deficiency in that a failure has occurred and the burden of proof that the installation complied with the Contract documents rests with the Contractor.

Since additional time will be required to fully assess the data submitted by the Contractor on September 29, 1976, to support his contention that the materials, application and cure of the linings were as specified, we recommend that the County issue a semi-final estimate releasing to the Contractor all monies due under the Contract less an amount estimated to be the cost of correcting all uncorrected deficiencies. Assuming the resolution of a time extension will be left until the final settlement, the estimate should include a statement to the effect that, although liquidated damages have not been deducted, the County does not waive its right to do so.

Since the responsibility for the failure of the rubber linings and the cost of ultimate corrective measures are still indeterminate, we recommend that the deduction against uncorrected deficiencies include the full cost of the rubber linings for all of those carbon vessels wherein failures are found to have occurred. We believe this amount to be in the order to $20,000 per column.

Regarding these determinations, we have reviewed the data attesting to the equality of the Uniroyal rubber to the Goodrich material specified and the application and degree of vulcanization of the original installation, as submitted to the County by the Contractor at our meeting on September 29, 1976. As we have discussed with you, we believe this data now substantiates, from a practical point of view at least, the equality of the Uniroyal rubber and presents new information intending to demonstrate that the original installation and cure was as specified and that some subsequent condition caused the failures. Inasmuch as an evaluation of the new data requires expert knowledge of the chemistry of rubber and since Uniroyal has not yet taken any formal position in this matter, Uniroyal must be contacted to review the problem and the data submitted by the Contractor. In accordance with your instructions and the concurrence of George Hudak we are preparing a letter to Uniroyal transmitting same and requesting their comments.

Pursuant to your instructions, we have made some initial determinations of the scope of an independent testing program to uncover the specific causes of the failures and have contacted a laboratory in this area we believe can do the work required. We feel, however, that the initial burden of proof rests with the Contractor, its applicator, and supplier and that the investigation should be pursued by these parties as long as it appears productive.

Should Uniroyal's response fail to lead us to a determination of responsibility or should our eventual position be challenged, we can, on your authorization, proceed with independent testing.

Very truly yours,

METCALF & EDDY

October 14, 1976

CUYAHOGA COUNTY, OHIO
SEWER DISTRICTS 6, 10, & 12
IMPROVEMENT 615A
ROCKY RIVER WASTEWATER TREATMENT PLANT
CONTRACT NO. 1

FINAL PUNCH LIST

This punch list is limited to the items of Contract work we believe not to be in compliance with the Plans, Specifications, and approved ship drawings.

Item Number		Description
4A	Concrete Class A	1. Correct slope on concrete apron at south truckway door of carbon building.
9	Valves	1. Install chain wheel operators on two (2) backwash pump discharge valves in carbon building.
10	Pumping Equipment	1. Verify that the impellers in the settled water pumps are 23 inches in diameter as stated in certified pump curves.
		2. Verify that the impellers in motive water pumps 1 and 2 are 13-1/16 inches in diameter as stated in certified pump curves.
11	Metering and Control Equipment	1. Furnish and install a new motor for the effluent control valve for column 5.
		2. Replace the cracked case on the variable position valve indicator for the backwash valve on console "B" at column 4.
12	Carbon Absorption, Transfer and Regeneration Equipment	1. The rubber linings in three (3) of the carbon columns have failed. These failures and others which may be revealed upon inspection of the remaining rubber-lined vessels are being investigated to determine the cause of the failures. Since the burden of proof of compliance with the Contract Documents rests with the Contractor, the linings are listed herein pending this determination.

		2. A constant speed unit was substituted for the variable speed unit specified for the carbon feed screw conveyor.
17	Grease Handling Equipment	1. A 7-1/2-HP motor is installed on the scum grinder. The Contract Drawings show a 20-HP motor for this service.
		2. A 3-HP motor is installed on the scum mixer. The Contract Drawings show a 10-HP motor for this service.
20	Painting	1. Paint the following surfaces:
		a. The galvanized wire way over the screen control cabinets and starters in the grit building.
		b. The galvanized chlorine injector water line from 10 feet downstream of the pump discharge to the eductors.
		c. One (1) plug valve in the digester area.
		d. The two (2) galvanized resistor boxes over the Ikor control panels in the settled sludge pumping station.
29	Chlorination Equipment	1. Install one (1) pressure gauge between chlorine evaporator and gas pressure reducing valve.
Change Order No. 10		10A. The saw cuts in the concrete roadway have not been sealed.
		10K. Make the electrical tie-in between the scum pumps and grease preparation grinder.

CSD-4862 October 14, 1976

SUPPLEMENTAL PUNCH LIST

CONTRACT NO. 4
ELECTRICAL WORK

Item Number	Description
33 Electrical Work	1. Replace the circuit breaker for the scum grinder with a circuit breaker of the size that is compatible with the scum grinder motor (30 amp trip). 2. Replace the overload heaters for scrubber water pumps 1 and 2 with the size that is compatible with the motors. 3. Install the missing lighting fixture on the street lighting pole at entrance to carbon column building. 4. Install guy wire on dead end pole at filter building.

APPENDIX B

"THE R&D PROJECT

CONFIDENTIAL

METCALF & EDDY
50 STANIFORD STREET, BOSTON, MA 02114
ENGINEERS

July 23, 1975

J-4362

Mr. Stephen Sebesta
County Sanitary Engineer
CUYAHOGA COUNTY COMMISSION
Division of Sanitary Engineering
1279 West 3rd Street
Cleveland, Ohio 44113

Dear Mr. Sebesta:

In accordance with our agreement, and based on our site visitations and review of the contract documents and other related materials, we recommend that the use of the activated carbon system be discontinued as soon as practicable. The major considerations behind this recommendation are:

1. The contractor has denied responsibility for any damage resulting from the continued use of the activated carbon columns.

2. The County, by continuing to use the carbon columns, is, in effect, assuming the responsibility for any further damage to the columns as a result of that use.

3. Carbon losses will continue, a loss which, in monetary terms, is significant to date.

4. Further adverse secondary effects of carbon loss such as the obvious deterioration of the surface wash water pump capacity.

5. The continued use of the carbon columns is not required by the present NPDES permit. In addition, EPA, in recognition of the marginal performance agreed the continued use of the columns is not consistent with the objectives of the R&D project.

6. That proper inspection and recommendations for repair and modifications to facilities in general can only be accomplished with the carbon system out of service.

In summary, there is, in our judgement, no compelling reason to keep the carbon columns in service as presently functioning and it is in the best interest of all concerned to discontinue the operation. It is our understanding that the County plans to regenerate the carbon during this period and has made plans for storing both spent and regenerated carbon.

In connection with the lining failure, we recommend that the county require, under the provisions of Article 16 of the General Conditions of the contract documents, that the contractor submit, in writing, his proposed methods and materials for repair.

We are proceeding with our evaluation of the mechanical systems and the carbon columns as filters.

As agreed previously, a meeting with EPA to discuss the alternative courses of action should be scheduled. I would suggest the week of August 9th (I'll be on vacation August 2-6).

Very truly yours,

METCALF & EDDY

Subject: NPDES Requirements Facilities Planning

Dear Mr. Sebesta:

In accordance with your request we have reviewed the plan of study submitted as a part of the County's Step 1 grant application for Facilities Planning for Rocky River. Our review is in the context of our engineering agreement with the County on advice and consultation in connection with the R&D project at Rocky River.

Under provisions of the NPDES permit, Rocky River is to attain the equivalent of secondary treatment including phosphorus removal for all wastes discharged from the plant. The plan of study covers all aspects of facilities planning and there is explicit provision for satisfying the requirements of facilities planning as outlined by EPA. However, we find the plan is not explicit in identifying the engineering effort required to establish and select a waste treatment system for Rocky River. Specifically, we find no indication or recognition of the need for pilot plant work to arrive at the most cost effective waste treatment system for Rocky River, the R&D project notwithstanding.

As you are aware from past discussions we would not recommend the present flow sheet at Rocky River as the long term solution to the waste treatment needs without piloting and extensive modification. While the subject of the R&D project will be dealt with in considerably more detail in another report, suffice to say that the R&D project will not be conclusive regarding the most cost effective waste treatment option for Rocky River.

Mr. Stephen Sebesta
County Sanitary Engineer
CUYAHOGA COUNTY COMMISSION
Division of Sanitary Engineering
1276 West 3rd Street
Cleveland, Ohio 44113

Dear Steve:

As a follow-up to our telephone conversation the other day, I wanted to reiterate our concern regarding the presence of carbon in some of the columns. As indicated previously carbon must be removed from all the columns as soon as possible to prevent continued deterioration of exposed carbon steel wall. At the same time all piping instrumentation and pumping systems must be purged to assure the integrity of those systems.

We have been unsuccessful in extracting information on the installation of the lining system from the contractor and feel that this request should now be in writing. It is important for the contractor to supply the county with the specific manufacturer's instructions on the installation of the lining system as well as an outline of the procedures actually used including those used for vulcanization in as much detail as possible. I believe that previously the county had requested information regarding lining material. This request should be reiterated.

As discussed, I expect to have all of the reports on the "shake down" inspection the first part of next week or about the 28th of September and to have a preliminary evaluation of all the results by the end of the week so that we can discuss it in Minneapolis, St. Paul. From there it would seem that a meeting with the contractor some time the week of October 11 or 18 would be appropriate to review the status of our work and the disposition of the remaining items. The outstanding item, of course, remains the lining itself.

In view of the above, we would suggest that you meet as soon as possible with your engineer for Facilities Planning and (subsequently) representatives of the Ohio EPA and Region V representatives to discuss the scope of work prior to the approval of the Step 1 grant application. While an amendment to the grant would be possible after approval, to avoid future delays, an early meeting and concurrence is recommended.

Very truly yours,

METCALF & EDDY

Francis C. Sampson

FCS:mar

On the subject of EDA funds for projects at the plant, I am enclosing a list of possible projects. You will note that this list does not include major modifications to the sludge handling facilities. I am extremely reluctant at this time to propose that you make major capital improvements to the sludge handling facilities in light of the long range needs of the system and the engineering time needed to properly plan such improvements. Many of the items, however, could improve or make less labor intennive both sludge handling and the preliminary treatment areas.

As you know, I am something less than enthusiastic about the entire EDA program in regard to waste treatment projects. I am fearful that in the crash to get the money, many ill-conceived, poorly planned projects will result. I am sure you have a fairly large laundry list for other areas in the county. In any event all the items on the attached list would be included in the overall improvement to the plant facilities under PL 92-500. However, I realize that it's not politic to turn down an opportunity to get Federal grants, and feel that the items on the list could be, in fact, ready to go to bid within the required 90 day time frame (be prepared for review by EDA within the 60 day time limit). This program is one that remains unclear in my own mind, that I can see the potential for delays in any event just through the application process. I assume that the county will pick up and administer the entire application process.

There was insufficient time to estimate the costs for this list of improvements, but for preliminary application purposes, $200,000 is the order to magnitude. If you feel that these projects warrant further consideration, please advise and we will prepare a firm estimate on these improvements. In the meantime, I look forward to seeing you and getting together with you in Minneapolis, St. Paul.

Best Regards,

METCALF & EDDY

Francis C. Sampson

Possible EDA Projects

Modifications to Existing Treatment Facilities

Pretreatment

1. House Mech. Clean Screen; Conveyor and Screenings container in a new building addition to eliminate freezing.

2. Convert existing mechanically cleaned screen from 1-1/2-in. clear opening to 1-in. clear opening to reduce rag problem at the grit chamber, thickener and digester.

3. Provide adequate H&V in new addition and existing pretreatment building.

4. Replace existing Jeffrey grit washer with a grit classifier. Existing unit is inoperative.

5. Insulate existing standby generator exhaust pipe to 8 ft. minimum above floor. The present exposed pipe is a safety hazard.

Chlorination System

1. Add a second chlorine injector water pump to provide standby service. Only one pump is presently installed. This does not comply with reliability standards.

2. Provide a standby chlorine evaporator.

3. Replace existing 10 hp injector water pump motor with a 15 hp motor to eliminate existing 15% overload on motor.

Carbon Column Building

1. Provide heating and ventilating system to prevent deterioration of building and equipment.

2. Replace existing vertical, extended shaft sump pumps with non-clog submersible pumps. Carbon in the building drainage has damaged the shaft bearings of the existing pumps. Also, the existing pumps are <u>not</u> now clog pumps.

3. Provide building sump high level alarm to prevent dry well flooding and provide standby bubbler air compressor. Connect alarm to remote site.

4. Relocate the discharge of the building sump pump discharge force main at the existing Rocky River Pump Station. This discharge presently rises above ground and discharges into the influent chamber. To prevent freezing, the discharge should be located below grade. These may best wait for overall plant study.

Sludge Treatment Building

1. Install grit ejector system. This will eliminate manpower to manually wheel grit carts from the extreme rear of the building to the truck dock.

2. Install sludge cake ejector (conveyor) system. This will also reduce manpower needs.

APPENDIX B

PUMP TESTING

During the inspection trip of September 14 through 17, 1976, pump tests were made on the following pumps:

Settled Sewage Pumps

Backwash Pumps

Surface Wash Pump No. 2

Motive Water Pumps 1 and 2

Motive Water Pumps 3 and 4

Building Sump Pumps

Effluent Water Pump (Chlorine Inspection Pump)

Sludge Pumps.

With the exception of the Settled Sewage pumps, the Surface Wash pumps and the Effluent Water (chlorine injection) pump, the pumps meet the requirement of the contract.

The Settled Water pumps appear to be overpumping and, if this is true, could seriously overload the 500 hp motor and the speed controller if the units are operated at full speed. These pumps should be retested, or the top cover removed to verify the impeller diameter.

The test of the Surface Wash pump No. 2 is inconclusive in that we could not conduct a satisfactory test on this pump. I expect that the problem is with plugged impellers as was found

for Pump No. 1. Therefore, I recommend that this pump be disassembled to verify and clean the impeller. If the impeller is found plugged, the pump should be accepted.

The Effluent Water pump meets the requirements of the contract documents and should be accepted. However, this pump operates at less than the design head and is overloading the drive motor by about 15 percent.

Comments on each of the pumps tested are as follows:

Settled Water Pumps

The pumps were tested in the manual mode by discharging water through carbon columns 2, 3, 4 and 6. Flow was controlled by the column rate of flow controllers and was indicated by the influent flowmeter.

The shut-off head could not be checked because there is no shut off valve - only the automatically controlled butterfly valve. If the butterfly valve was manually held closed, the IKOR controls would shut the pump down.

The pumps could not be operated in the automatic mode or at full speed. In the automatic mode, the controls would call for full speed operation because of high wet well level. The pumps could not be operated at maximum speed since the maximum flow through each column is only 3 mgd or a total of 12 mgd. At the 12 mgd rate, the pump rating curve indicates a discharge pressure of 65 psi.

This pressure would over pressure the carbon columns. Therefore, the tests were made under normal control at a speed

of about 700 rpm. The result of the runs at 700 rpm have been converted to operation at 880 rpm by the pump laws to check the results against the pump rating curve.

The field tests indicate that these pumps pump more than the specified capacities. The shop drawings indicate that the impeller was trimmed to 28-in. diameter. The field tests, when corrected to equivalent performance at the shop drawing curve speed of 880 rpm, very closely match the capacity curve for a 30-in. diameter impeller. If the 30-in. impeller has been installed, it will overload the motor greatly when operated at full speed. (The 30-in. impeller draws 690 hp at 14,000 gpm).

Unfortunately, this problem was not discovered until the field data were analyzed. At this time, it was too late to retest the pumps to confirm the original results. Also, it should be noted that the field test was not conducted under ideal conditions so that the test results are probably accurate only within 5 or 10 percent.

I feel that this pump should be either retested or, possibly, the top cover removed to measure the impeller diameter. There is a question as to whether the correct size impeller has been installed.

The IKOR speed control unit seemed to operate satisfactorily in the manual mode. The speed indicator agreed with the pump speed as measured with a strobe light. As noted above, the unit

could not be operated in the automatic mode, but we would expect satisfactory operation, based on the operation under manual control.

Backwash Pumps

These pumps were tested at shutoff and by passing water through the rate of flow controller of Column No. 4. When the flow was within the range of the controller the flow was indicated on the controller. Higher flows were indicated on the backwash flowmeter. It was found that this flowmeter read about 7 percent below the flow of the rate of flow controller.

These pumps tested reasonably close to the pump rating curve and did not overload the motor.

Surface Wash Pumps

Surface wash pump No. 1 has been disassembled for maintenance. Surface wash pump No. 2 was operable and was tested.

It was reported to us that Pump No. 1 has done the majority of operations since the plant was placed on line because of a defective check valve on pump No. 2. It was also reported that the capacity and the head generated by pump No. 1 has decreased as the hours of operation have increased.

Disassembled Pump No. 1 was inspected on September 14.

The wearing rings have opened up to about 1/16 in. (0.060 in.) radial clearance. I would expect clearance for a

new pump would be about 0.005 in. Also, large pebbles were found in the eye of the first stage impeller. The eyes of the second and third stage impellers could not be checked since the pump was not totally disassembled. These pebbles covered about one-half of the area of the eye. The pebbles were too large to enter the impeller vanes that are about 3/8-inch wide. I have two of the pebbles found in the pump.

The clogging of the eye with rocks would reduce the pump capacity but would not greatly affect the pump head developed at shut-off. Opening up the wear ring clearance will reduce both the developed head and the capacity because of the recirculation from stage discharge to suction.

The increase in clearance is probably caused by carbon. I do not know how the pebbles entered the pump. One fairly round pebble has a shape and material (3/4 inch by 3/4 inch by 1/2 inch) that may possibly be column gravel. The other is 1-1/2 inch by 3/4 inch by 1/2 inch and is sharp edged and of a coarse, soft material. In any event, this material could not pass through the 5/32 inch openings of the filter blocks.

Surface wash pump No. 2 was tested at shutoff head and by discharging through the fluidizing connection of column No. 4. Flow was measured by the total flow through the totalizing meter over a 10 minute period.

This test is inconclusive since the results do not approximate the pump curve except at shutoff head. The slope of the test curve is typical of that for a plugged impeller.

It is probable that this pump is clogged with pebbles as was found in pump No. 1. This would explain the satisfactory shutoff head but the loss of flow at reduced head. It is also possible that the propeller type flowmeter is partially plugged with carbon.

Based on the above assumption, I expect the pumps were satisfactory when they were first installed.

Motive Water Pumps 1 and 2

These pumps were tested at shutoff and by timing the filling of the spent carbon tank.

The test points exceed the rating of the pump curve, but do approximate the pump curve for the largest impeller. This indicates that the impeller may not have been properly trimmed.

At the operating point, that was about 65 percent of its rating, the pumps did not overload the motors. However, there is concern that if the pumps are operated at reduced heads, the pumps will overload the motors.

Motive Water Pumps 3 and 4

These pumps could not be fully tested because there was no place to discharge the water. Therefore, these pumps were only tested at shutoff head.

The shutoff head of these pumps agrees with the rating curve and the motor amperage is satisfactory.

Column Building Sump Pumps

These pumps were tested by measuring drawdown in the building sump over a timed period. They were also tested at shutoff.

The pump test very closely approximates the pump curve, but it appears that a slightly oversized impeller has been installed in that the pumps pump slightly more than their rated curve. This results in a small (5 percent) overload on the north pump motor.

However, this is acceptable since these pumps do not operate constantly and the overload is well within the 1.15 service factor.

Effluent Water Pump (Chlorine Injector)

Because this single pump is used to supply all chlorine injection water, it could not be taken off line to give it a complete test.

It was tested by taking pressure and amperage readings when discharging to both injectors and to only one injector.

This pump does supply sufficient water to draw adequate suction for both chlorinators and is installed according to plans, specifications, and approved shop drawings.

The pump draws its full 10 hp at the rating point of 100 gpm at 200 feet. However, it was found that the pump actually operates between 165 and 180 feet. Under these conditions, the pump actually draws about 11.5 hp.

It should also be noted that there is no standby for this extremely important pump.

20-955 O—84——46

Sludge Pumps

The sludge pumps were tested by simple operation of the units. Since these are positive displacement units, no capacity testing was done.

Sludge Pump No. 2 operated satisfactorily.

Sludge Pump No. 1 has seized and could not be operated. It was reported by the Plant Superintendent that the pump has operated satisfactorily in the past.

APPENDIX C

RUBBER LINING FAILURE

Metcalf & Eddy, Inc.

August 17, 1977

CSD-4862
Rocky River

Mr. Stephen Sebesta
County Sanitary Engineer
Cuyahoga County Commission
Division of Sanitary Engineering
1276 West Third Street
Cleveland, Ohio 44113

Subject: Carbon Columns Rubber Lining Failure

Dear Mr. Sebesta:

In view of the additional information with respect to the condition of the rubber lining in Carbon Columns No. 4 and 8, provided us recently by the County, and a physical inspection of these columns on August 4, 1977, it is considered appropriate that this supplement to our letter dated April 15, 1977, on the carbon column rubber lining failure be issued.

During the time of the inspections and investigations leading to our earlier conclusions, Columns No. 4 and 8 had not been emptied and could not be inspected by either our forces or those of the County. When these columns were subsequently emptied and inspected, it was found that the linings were intact.

It had been reported that the original readings on all columns were 90 or higher, suggesting complete cure. As you are aware, no data has been produced to support this; however, County staff observed and, we are told, verified the original readings.

On August 4, 1977, we were provided the results of a series of durometer readings taken by County personnel, essentially throughout the lower quarter of Column No. 4, with two readings higher in the column, which demonstrate an average Durometer A of approximately 88. (See attachment.) While this average is somewhat less than the 90 reading designated by the manufacturer as cured hardness, it should be noted that the test is inherently subject to variation.

In exploring whether Columns No. 4 and 8 were exposed differently than the others, we were advised by County personnel that the operation of these columns was such that the levels of hydrogen-sulfide and copper-sulfate and the number and extent of backwashings were similar, if not identical, to those in the six columns found to have been damaged.

The significance of the data is that Columns No. 4 and 8 have withstood the conditions of service without deterioration similar to that observed in the other columns after being cured, apparently, to the same degree. The only difference being that Columns No. 4 and 8 were the only two in which complete vulcanization was judged to have occurred at the completion of the initial curing period. In the other six tanks, readings less than 90 Durometer A were observed after the initial cure, and steam was reintroduced.

In summary, while the additional data and observations would seem to reinforce the theory of incomplete vulcanization as the most likely cause of the lining failures, (see memorandum on this subject dated August 10, 1976, copy attached) the lack of data to show the degree of original cure make a definitive statement difficult.

We are, therefore, still of the opinion that in any litigation much would be made of the physical effects of the backwashings within the columns and the control problems associated with field curing of rubber linings and that there would be much erudite testimony with respect to the effects of hydrogen-sulfide and copper on rubber, tending, we believe, to confuse a jury with some consequent risk of a finding other than one completely satisfactory to the County. However, we believe that the weight of the more recent evidence, pointing to incomplete vulcanization as the root cause of the failures, is such as to place the County in a strong bargaining position in negotiating settlement of damages with the Contractor.

Very truly yours,

J. T. Quinn, Jr., Assistant Chief
Construction Services Department

Boston
August 10, 1976

MEMORANDUM FOR THE RECORD

On July 8, 1976 Messrs. Samson, Gunby, Jennings and George of Metcalf & Eddy visited the Rocky River Treatment Facility in Cleveland, Ohio to discuss several problems with the Cuyahoga County Personnel. One of the problem areas discussed was the failure of rubber linings in the carbon columns at the plant. The specifications for the project call for a three-sixteenths inch thick Goodyear type 206 LL415 rubber lining applied in accordance with the manufacturers instructions and recommendations. The drawings for the project show the rubber lining extending from four inches below the concrete fill in the bottom of the column up to a point where the domed head begins. The head was not to be lined according to the drawings.

We were informed at the meeting that the rubber lining work was subbed to Protective Coatings, Inc., who used a Uniroyal material not yet identified to us for the lining. Letters from Protective Coatings, Inc. stated that the heads should be lined and that the lining should extend to at least 8 inches below the top of the concrete fill or they would not be able to guarantee the installation. We were informed that this change order was not processed but construction photographs show the heads to be lined and indicate that the lining did extend 8 inches or more below the concrete surface in the bottom of the columns.

When one of the columns was opened because it would not function properly it was found that the rubber lining in the lower portion of the column had debonded from the wall and peeled downward to the bottom of the column. Subsequently, two additional columns were taken out of service and found to be in similar condition. Additional problems in the columns involved the apparent failure of the diffusers which were supplied by Einco and apparent corrosion of the fasteners used to secure the diffusers.

Messrs. Gunby and George were shown through the plant by K. Scheutrow, Project Manager for the County and W. Porter, Superintendent of the plant. On inspecting the carbon columns and rubber lining which had failed, it was noted that the rubber lining was applied with a two inch lap joint. The edges of the lap material were not skived in a manner to bring similar types of rubber together. That is to say, the lap was made in such a manner that the soft rubber overlapped the semi-hard

See sketches below. We were informed by K. Scheutzow that in making the lap there was no adhesive between the two layers of rubber but that the lap area was wiped with a solvent just before applying or making the lap. It should be noted that a normal procedure in making the laps or joints in rubber would be to wipe with solvent and press the edges of the raw rubber lining together so that the vulcanization process would complete the fusing of the two materials. The curing of the rubber lining was apparently performed by introducing steam into the column and then sealing the column. County personnel are unable to identify the material used other than it was a material manufactured by Uniroyal. County personnel also had not yet seen Uniroyals instructions for installation of the material. The County personnel had a copy of a recommended installation procedure that was written by Protective Coatings, Inc. No one is able to state with certainty that the procedures followed were in accordance with the Uniroyal recommendations for this material. There are no records of the length of time the steam was applied to the column, the temperature reached within the column, or how long the temperature was maintained.

On examining several pieces of rubber lining which had been removed from the columns it was found that the lap joint could be easily separated indicating improper joining of the material, which could be due to either poor procedures or improper vulcanization. We were informed that the original durometer hardness of the material after curing (vulcanization) was 90. The durometer hardness of the material now is reported to be 70 indicating some deterioration in the lining. On reaching into the columns it was possible to grasp a portion of the lining that was hanging from the wall and to pull on the lining removing it still further from place indicating improper bond of that part of the lining to the steel wall of the column. Where the lining has peeled from the wall there is extensive rusting of the steel, although the steel did not appear to be very badly pitted at the time of our inspection. In one section on column No. 7 a portion of the lining has been peeled from the wall by County personnel exposing a gray white steel surface indicating that proper surface preparation was probably performed but that the bond of the rubber to the steel is insufficient.

It was further reported to us that Uniroyal has made several trips to the sight to investigate potential causes of failure and is now preparing a report to the County of their findings. The report was scheduled for completion about the middle of July and we have requested a copy of the report.

The inspection of the columns also reveal that numerous diffusers had warped, possibly from high temperature. This

could account for carbon loss because the warped diffusers do not close tightly in normal operation and could allow carbon to enter the air piping. Additionally, some of the diffuser pipes have rotated indicating the application of a large torque (perhaps during air scour, from partially clogged diffusers).

The bolt holding the defuser in place appears to be a stainless steel bolt approximately 4 inches long with a nut on the threaded end. The corrosion of the fastener that was observed primarily involved the nut which was, in some cases, practically nonexistent. In other instances the nut was badly corroded indicating severe pitting attack. Mr. James Pickering, Superintendent for Spahn Co. (the general contractor) provided us with a new bolt and nut which he stated were furnished by Eimco who provided the diffusers. Mr. Pickering stated that he had tested the bolts and nuts with a magnet and found that they were nonmagnetic thus indicating that they were stainless steel. We have applied a magnet to the nuts and bolts provided by Mr. Pickering and find that they are nonmagnetic. Mr. Pickering also informed us that when we were installing the diffusers they were concerned that the nut might work loose thus allowing the diffusers to fall off and they tried several means of fastening the nut in place. On some of the fasteners they attempted to deform the threads with a center punch but felt that that was insufficient. On others a tack weld was tried but it was found that the heat build up was excessive and could damage the plastic washer on the diffuser, therefore, they resorted to applying a rubber cement material on the nut and exposed threads in order to secure the nut in place. All of the nuts that we so coated appeared to have corroded to the point where some have almost entirely disappeared. There has also been slight attack of the threads on the bolt in the area where rubber cement was applied to hold the nut in place. There is no information from Eimco relative to the alloy used in the fasteners. This information should be provided although it may be academic because it would appear desirable to have a diffuser system that would remain operable under the service conditions.

Conclusions and Recommendations

Corrosion of the wall of the columns can be expected to progress rapidly. It is probable that the corrosion will proceed to a point where severe damage will take place making it very difficult, if not impossible, to reline or coat the surface. The poor operation of the air scour system and the

large carbon loss which is being experienced indicate that the columns are not operating properly and that the expenses of operation are inordinate. Based on the corrosion damage and carbon losses it is recommended that the carbon columns be taken out of service at this time and corrective measures investigated immediately. Shutting down the carbon columns will still leave the plant in operation producing a better effluent than that produced by the primary plant before expansion. Continued operation of the carbon column is of dubious value at this time and will result in increased corrosion damage and carbon cost. Investigation and recommendations for repairs to the columns will necessitate removing them from service so as to assess the full damage and to perform the repairs. Uniroyal should be required to identify the material used in the columns and its suitability for the service. They should also provide their written instructions and recommendations for application of the material and a recommendation for repair or replacement of the lining. If the corrosion of the fasteners holding the diffusers in place is to be pursued we will need further information as to the alloy of the fasteners. We can conduct tests on the fasteners supplied to us to determine the suitability of the alloys for this service. In view of the fact that the diffuser system currently in the columns does not appear to be able to withstand the operating conditions, it is recommended that the air scour system be rethought so as to provide a proper operating system.

Subject: Carbon Columns Rubber Lining Failure

Dear Mr. Sebesta:

The purpose of this letter is to review the facts of the procurement and installation of the subject rubber linings to determine the extent of responsibility of the Contractor for the lining failure.

The Contract requires that the Contractor furnish materials and perform the work in accordance with the requirements of the detailed Specifications in a workman-like manner generally consistent with standard practice.

Item 12.7 of the detailed Specification states that the rubber linings shall be of 3/16-inch thick B. F. Goodrich Type 206LL415 or an approved equal and that the installation shall be in strict accordance with the manufacturer's standard procedures and recommendations.

Taking the matter of material first, the Contractor actually used Uniroyal Type 5720-5660 Rubber and did so without specific approval by the County for this substitution.

When asked subsequently to establish the technical equivalence of the Uniroyal material, the Contractor produced comparison charts prepared by Goodrich which appear to indicate that the Uniroyal rubber is a competitive equivalent grade of semi-hard rubber to the Goodrich Type 206LL415 specified.

Having determined from the Rubber Manufacturerers' Association and others that there is no industry-wide authoritative source providing such comparisons, we are inclined to accept the data submitted to the effect that the materials are equivalent and believe further that had this data been presented prior to the application of the rubber, it probably would have been accepted as an equivalent by the County.

The installation of the lining, performed under a subcontract by Protective Coatings, Inc., was specified to be in accordance with the rubber manufacturer's instructions. The Contractor has subsequently submitted Uniroyal Specification No. 6-67 which generally describes the recommended procedure. Also subsequently submitted was a copy of Protective Coatings' "Procedure for Application of Rubber Linings" with a statement by Uniroyal that it is an acceptable general specification for conventional tank lining applications. The requirements of each are similar as follows:

1. Preparation of surface by sandblasting to white metal - We are told this was observed by County personnel and by Solar Testing on behalf of the County and was accepted.

2. Use of proper adhesive - Data has subsequently been submitted to the effect that the adhesive specified by Uniroyal for this rubber was furnished by Uniroyal and used by Protective Coatings.

3. Uniroyal recommends that joints be overlapped at least 2 inches - Protective Coatings adds that overlapped joints shall be skived and turned down, which we understand to be common practice in the rubber lining industry. The latter was not done entirely; the joints are skived, but not turned down thus exposing a small area of the soft rubber to the chemical and physical conditions within the columns. (See enclosed sketch.)

4. Vulcanization - After installation, the rubber is to be vulcanized by the introduction of atmospheric steam so as to maintain a temperature of approximately 200°± F within the vessel for a minimum of 36 hours and until the rubber reaches a Durometer A hardness of 90.

   To the best of our knowledge, there are no formal records available indicating the procedures, temperatures, and duration of cure or of the hardness readings. We were told, however, by Protective Coatings that the linings were cured one tank at a time by steam introduced at the bottom for an average of 36 hours each. Protective Coatings had a supervisor on the site during this operation, at least, during the day shift; the General Contractor's personnel watched the operation during overtime periods. Durometer readings were taken at the bottom of each tank to determine the completeness of the cure and, we understand, were witnessed by County inspectors. The cure was considered complete by the applicator for each vessel when a reading of 90 was obtained in the bottom.

It would appear from the foregoing that the surface preparation, application, and cure were essentially as recommended by the manufacturer with the possible exception of the joint construction in the fact that the overlap was not turned down, i. e., back to the adjacent surface to give a smooth appearance, as stated in Protective Coatings' own specification.

After several months in operation, however, the rubber lining in most of the tanks was found to have failed; in essence, the first horizontal joint from the bottom separated and the bottom row of rubber sheets separated from the wall to varying extents. It is presumed that the adhesion of the rubber to the wall and rubber to rubber at the joints had both failed. This is borne out by our own observation that the lapped joints in failed sections could be easily separated by hand and that sheets still adhering to the walls below a failed area could be peeled down further without difficulty.

Since the adhesion process of both rubber to steel and rubber to rubber depends on complete vulcanization and given the fact that Durometer A readings, taken on the rubber within the areas of failure after the failure, averaged 70, the cause of the failure was initially presumed to be incomplete vulcanization.

To refute this presumption, the Contractor engaged the professional services of Edglo Laboratories, Prof. Shelton of Case Western Reserve University, and the Institute of Polymer Sciences at the University of Akron. Subsequently, at the County's request, Uniroyal itself was asked to investigate the failure and to comment on probable cause.

While the conclusions drawn by these several parties are somewhat contradictory, the following causative factors appear to be involved:

1. Some degree of undercure in the bottom areas of the tanks, although probably not to the extent indicated by the Durometer A 70 readings.

2. Some degradation of the rubber after vulcanization, possibly due to both hydrogen-sulfide and copper. Although there is some difference of opinion between Uniroyal and the authorities engaged by the Contractor as to the effect of hydrogen-sulfide on the rubber, there is universal agreement that copper has a deleterious effect on rubber.

3. The physical effect of the air scour and the ram effect of the carbon bed upon cessation of backwashing acting on horizontal lapped joints.

Given these factors, we believe it impossible to assign sole and complete responsibility for the failure to the Contractor. While the joint detail and the extent of cure is suspect, we believe it would be difficult to prove that these factors alone resulted in the failure. The apparent degradation and/or the physical effects of backwashing and air scour, both completely beyond the Contractor's control, we believe, contributed materially to the failure. The inability to assign sole responsibility for the failure to either the material or the workmanship makes it difficult to assess the extent of actual damages to the County for which the Contractor might be held responsible. We believe, therefore, that the

County's interest would be best served in relieving the Contractor of any responsibility for the failure, considering it rather to be one aspect of the research and development project which proved to be undesirable. To do otherwise would require, we believe, prolonged and costly litigation of uncertain outcome and might, in fact, delay the more important considerations of developing a waste treatment facility to meet the NPDES requirements.

Very truly yours,

MEMORANDUM FOR THE RECORD

SUBJECT: Rock River STP
Sludge Furnace Inspection
By Nichols Engineering

1. The report on the Sludge Furnace dated 12/23/74 has been reviewed.

1.1 Moisture content should be reduced as much as practicable to reduce the fuel used.

3.6 Continuous operation is more economical than intermittent operation, because of the high fuel cost for maintaining furnace temperatures.

1.9 Delivering by-pass air to the I.D. Fan inlet is patented by Nichols. If competitive bidding is desired other options should be permitted such as air to the scrubber discharge for plume suppression.

1.10 Depending on the design of the air ducts, additional dampers may not be required.

2.1 The guillotine damper and associated controls could be eliminated from the system to improve the operating efficiency. Such large dampers leak, increasing power requirements.

2.2 Additional controls should also be provided for the by-pass damper to permit partial closing when the furnace is in a stand-by mode to conserve heat.

3.2 It is recommended that the exhaust gas system be sized for 150% excess air at rated capacity and have a 50% turn down capability.

3.4.1 The material of construction of the venturi throat is questioned. A more durable material such as Hastalloy "C" or tungsten-carbide should be provided.

3.5.2 Additional requirements should be included for the I.D. Fan to limit noise generation.

3.6.7 Inertia pads should be required.

3.6.9 A variable speed drive should be considered in lieu of inlet vane control to permit greater flexibility in control and permit utilizing of more sophisticated instrumentation now availabl

4.3 Excess air burners are not recommended. Such air cannot be controlled. Considerable fuel is required to raise the temperature of the air.

4.13 FIA is now called Industrial Risks Insurers.

2.0 A thirty day operation period should be required as part of the testing as well as detailed operator training.

GENERAL

The proposal covers the major areas requiring modifications to the furnace, however considerable refinement and detailing is still required which could be accomplished with the contract drawings and specifications. Some of the underlying assumptions should no longer be valid for this change. i.e.

sludge cake moisture
cost of fuel
availability of fuel
additional APC requirements

Heat balances should be required to cover the anticipated range of operation and not just one condition.

The brick, refractory, mortar and insulation in the furnace after such a long period could have been adversely effected by factors which could serverely reduce their life. Such factors may not become apparent until the unit is placed in operation. An inspection by a refractory expert should be made, independent of the furnace manufacturer.

After such a long idle period there is the possibility of additional problems arising in any rotating or moving parts.

Subject: Rocky River Sewage Treatment Plant
Sludge Furnace Inspection and Report

Dear Mr. Puzenski:

In accordance with the resolution adopted by the Board of County Commissioners on July 29, 1974, we are pleased to submit the subject report.

The report has been prepared in the form of detailed specifications deliniating the required modifications to the furnace. Our recommendation for necessary spare parts and a description of the physical integrity of the facility, preceed the detailed specifications.

We would like to extend our thanks to Mr. Paul Beck and the plant personnel for their assistance during our two inspection visits to the plant.

Very truly yours

A. General

1.0 This section shall include the furnishing and installation of equipment to modify the existing sludge incinerating equipment as indicated on the Contract Drawings and in conformance with the following specifications.

2.0 Essentially the modifications shall consist of the addition of an adjustable throat venturi impingment scrubber, scrubber water supply and drain piping, induced draft fan, combustion air fan, dampers, burners and burner tile, thermocouples, controls and fuel supply piping.

3.0 The existing installation consist of one (1) Nichols Engineering and Research Corp 18'-9" diameter by 5 +0 hearth incinerator having a rated capacity of approximately 6200 lbs/hr of wet sludge filter cake.

4.0 The Contractor shall be responsible for inspecting the system and conditions to determine the extent of difficulty and work to be performed in installing equipment and/or modifying existing equipment and structures. No added compensation will be allowed for the alteration of visible equipment or conditions after award of Contract.

4.1 Where the existing building structure is damaged or disturbed during the installation of the modifications, or removal or relocation of existing items or installation of new items, or where unused openings are left by removal of existing items, the disturbed or abandoned area shall be restored to its original state to a degree satisfactory to the Engineer.

5.0 The existing sludge incinerator modifed under this section shall be guaranteed as to performance by the Contractor in addition to any other guarantees required under the General Conditions of this Contract. Such added guarantee covering operational results of the installed equipment shall be included as part of the bid and shall be designated as "Equipment Performance Warranty of Sludge Incinerators". The Warranty shall be as hereinafter specified.

6.0 All equipment shall be equal to equipment manufactured by the Nichols Engineering and Research Corporation of Belle Meade, New Jersey or approved equal. Existing equipment was manufactured by Nichols Engineering and Reserach Corporation.

6.1 For optimum installation, the Contractor shall designate the manufacturer as the subcontractor as provided by the Contract Documents.

OMMENDED SPARE PARTS:

) Alloy Rabble Arms

Set of Brick for (1) "in" hearth consisting of:

(100) A-9173-13 Special Shape
(105) A-9173-10 Special Shape
(920) 9" straights (standard 9" x 4½ x 2½)
(930) #1 arches (standard 9" x4½ x (2½-2 1/8)
(240) #1 wedges (standard 9" x 4½ x (2½ - 1 7/8)

Set of brick for (1) "out" hearth consisting of:

(35) A-9173-13 Special Shape
(35) A-9173-8 Special Shape
(35) A-9173-9 Special Shape
(650) 9" Straights (standard 9 x 4½ x 2½)
(900) #1 Arches (standard 9 x 4½ x (2½ - 2 1/8)
(20) #2 Arches (standard 9 x 4½ x (2½ - 1 3/4)
(240) #1 wedges (standard 9 x 4½ x (2½ - 1 7/8)

) Shaft section A-4194-53 (C.I.)

2) A-4800-8B Shear Pins

OTAL PRICE: $20,000.00

Nichols Engineering & Research Corporation

C. Capacity of Installation

1.0 The sludge ~~incinerator~~ installation shall be capable of incinerating 6200 lbs/hr ~~of sewage~~ sludge filter cake resulting from the dewatering of primary or digested sludge and 1 gpm maximum of grease.

1.1 Capacity rating shall be based on sludge filter cake having the characteristics set forth in paragraph "D".

2.0 In addition to the design rated capacity stipulated above, sludge incinerator shall be capable of incinerating dewatered sludge filter cake satisfactorily and without obnoxious odors, excessive smoke or fly ash and not to exceed the particulate and smoke emission standards specified hereinafter when operating over a range of loading varying from fifty percent (50%) to one hundred percent (100%) of the designed rated capacity.

2.1 The calculation of capacity when made for purposes of determining compliance with the Warranty will be based upon the design rated capacity of sludge filter cake and will be adjusted to the characteristics of the actual filter cake received, if such varies from the assumed characteristics given in paragraph "D".

3.0 The design of the installation shall be such as will burn the specified tonnage of dewatered sludge filter cake and grease in such a manner that will meet the terms of the Warranty herein, and to a sterile ash free from putrescible organic material or other odorous solids and containing not more than four percent (4%) volatile matter by weight.

Nichols Engineering & Research Corporation

B. Equipment Performance Warranty of Sludge Incinerator

1.0 The Contractor hereunder, and as conditions of his proposal, does state and warrant that the sludge incinerator of this proposed installation when incinerating vacuum filter sludging having the characteristics given in paragraph "D" of this Specification, and at the rate given in paragraph "C" of this Specification, and when operated for incineration according to the test procedure specified shall be free from nuisance of dense smoke, acid or other fumes, noxious gases, strong odors or excessive dust, dirt or fly ash and shall meet all pollution control requirements of the Specification at time of Bid.

D. Basis for Design, Warranty & Testing

1.0 Design of the installation shall be based upon meeting the operating requirements specified hereinafter, using the following assumptions in determining performance and in operating costs under tests, for compliance with the Warranty. Actual test conditions will be corrected to the basis given herein for determination of compliance with warranty.

1.1 Specific Heat Coefficients

Water Vapor	0.47
Air	0.24
Nitrogen	0.25
Carbon Dioxide	0.24
Dry Sludge Cake	0.20
Ash	0.20
Water	1.0
Oxygen	0.20

1.2 Ultimate Analysis of the Sludge Cake Combustibles

	Primary	Digested
Carbon	55.8%	
Hydrogen	8.2%	
Oxygen	31.0%	
Nitrogen	5.0%	
Sulfur	0	

1.3 Filter Cake Characteristics

	Primary	Digested
Moisture Content, Percent	78%	78%
Total Solids Content, Percent	22%	22%
Combustible Solids Content, Percent Dry Solids	60%	44%
Ash Content, Percent Dry Solids	40%	56%
Heat Value of Combustibles BTU/dry lb	10,000	10,000

2.0 Auxiliary Fuel Characteristics

	Natural Gas	Diges Gas
2.1 Gross Heat Value	1000 BTU/Ft^3	BTU/

Heat values used for warranty test purposes will be determined by test.

:. Operating Requirements

1.0 The sludge incinerator shall be capable of operating at the adjusted tonnage capacity of sludge filter cake without smoke, fly ash, or odor nuisance over a range of sludge filter cake characteristics as follows:

1.1 Moisture content from 70 to 82 percent.

1.2 Combustible solids content from 35 to 60 percent of dry solids

1.3 Heat value of combustible from 9500 to 11000 BTU/lb.

2.0 The Contractor during the warranty test shall provide for the services of an independent testing laboratory acceptable to the Engineer to determine the characteristics and chemical analysis of composite samples of the vacuum filtered sludge cake as well as the heat value per pound of combustible solids, the ash content and the moisture content and the specific gravity and high heat value of the fuel used.

Nichols Engineering & Research Corporation

3.0 Miscellaneous Factors

3.1 Base temperature of materials to be used is 60 °F.

3.2 Relative humidity - 85%

3.3 Excess air for combustion of sludge volatiles is 75% minimum.

3.4 Excess air for combustion of auxiliary fuel is 15% minimum.

3.5 Gas Outlet temperature is 800 °F minimum.

3.6 Operating period, Five (5) - Sixteen (16) hour days per week.

F. Incinerator Equipment

1.0 Sludge Combustion Air System

1.1 A complete new sludge combustion air system shall be furnished and installed for the sludge incinerator. Systems shall be complete with fans, motors, ducts, dampers, controls, refractory lined inlets, etc. arranged to provide adequate sludge combustion air as may be required for all conditions of sludge combustion as hereinafter specified.

1.2 The supply ducts shall terminate in refractory lined openings at the incinerators.

1.3 A pneumatic motor operated damper shall be provided in hearth air supply header duct for all the inlets on any one hearth.

1.4 Dampers shall be automatically and simultaneously controlled by the continuous oxygen analyzer and shall allow manual control from the central control panel.

1.5 A minimum of three (3) auxiliary air inlets shall be equally spaced around each of two hearths, minimum six (6) total.

1.6 Each inlet on each hearth shall be provided with a fixed orifice between air supply header and the hearth connection to assure equal supply through each inlet on that hearth at any position of the control damper.

1.7 Each fan shall be backwardly inclined blade, non-overloading centrifugal type, complete with a minimum two (2) HP motor, V-belt drive and drive guard. Outlet velocity of the fan shall not exceed 3600 FPM.

1.8 A pneumatic motor operated automatic multi-blade type control damper shall be provided on the inlet side of each fan to automatically control the air supply pressure to the system. Manually adjustable control stations shall be provided at the central control panel to manually set the point of the air supply pressure.

1.9 A new by-pass air duct shall be provided to deliver heated central shaft cooling air into the ductwork at the incinerator induced draft fan inlet.

1-10 A new floating type damper shall be provided in each existing air duct to the atmosphere. It shall be provided with counter weights to open automatically on power failure, induced draft fan failure, or loss of control air pressure.

3.3 The incinerator exhaust gas system shall be so designed that;

3.3.1 The dust concentration of the gases discharged to the atmosphere shall not exceed 1.3 lbs per ton of dry solids charged to the incinerator.

3.3.2 The smoke opacity as emitted from the exhaust stack shall not exceed twenty percent (20%) (1 Ringleman Number) for more than two (2) minutes in any one hour.

3.4 The exhaust gas scrubber shall be an adjustable Venturi high energy type designed to effectively remove dust particles from the flue gases and cool the flue gases to the final temperature herein specified.

3.4.1 The scrubber shell shall be fabricated of 316 ELC stainless steel not less than one-quarter (1/4) inch thickness and shall furthermore contain sufficient metal shell thickness or shall include sufficient stiffeners designed to withstand an internal negative pressure of forty (40) inches water column. Construction shall also be suitable for 400°F., maximum inlet gas temperature.

3.4.2 All internal welded components shall be 316 ELC stainless steel. All internal non-welded components shall be 316 ELC stainless steel. All support legs, angles, plates, etc. welded or attached to the scrubber and not in contact with or exposed to the flue gases shall be carbon steel.

3.4.3 The scrubber Venturi plate or throat area adjustment shall be pneumatic motor operated capable of being adjusted to any position between its open and closed limits. The Venturi adjustment shall be from the central control panel.

3.4.4 All piping and valves required for the water supply to the scrubber shall be included. The unit shall be designed to use plant effluent water.

3.5 The incinerator induced draft fan installation shall be capable of producing the necessary draft for operation of the incinerator, pre-cooler, wet type gas scrubber ducts, breeching and stack when the incinerator is operating at any load up to the maximum loading specified.

3.5.1 In addition to the capacity specified in paragraph 3.2 of this sub-section, adequate capacity shall be added to allow for the induction of center shaft cooling air into the draft fan inlet.

3.5.2 The incinerator induced draft fan shall be capable of delivering a minimum 4500 acfm at nominal static pressure of thirty (30) in. w.c. Outlet velocity shall not exceed 6000 feet per minute.

3.5.3 The induced draft fan shall be complete with a minimum Forty (40) Hp electric motor, V-belt drive and belt guard. Belt assembly shall have a minimum service factor of 1.5.

3.5.4 All surfaces of the incinerator induced draft fan exposed to flue gases and vapors shall be constructed of stainless steel.

3.5.5 Fan scroll sheets and side sheets shall be constructed of 316 ELC stainless steel having a thickness of not less than one -quarter (¼) in. The fan wheel spider, inlet cone, float cage, shroud plates, rim plates and back plates shall be constructed of 316 ELC stainless steel. The fan wheel blade shall be of the radial flat blade type constructed of 316 ELC stainless steel having a thickness of not less than three-eights (3/8) inch and shall be welded to the fan spider arms.

3.6.6 The induced draft fan shall be of special dust-tight construction with asbestos gaskets and cemented joints on all bolted connections. The scroll sheets shall be welded to the side sheets and in general the fan shall be of welded construct

3.6.7 Vibration isolator mounts of approved design shall be utilized to absorb vibration.

3.6.8 Each induced draft fan shall be lined with removable wear plates of the same material as the fan scroll and side sheets. Liners or wear plates shall have a minimum thickness of three-sixteenth (3/16) in.

3.6.9 The incinerator induced draft fan shall be provided with a pneumatic motor operated inlet van damper for capacity control. All surfaces of the damper housing, vanes, or other parts exposed to the flue gases shall be constructed of 316 ELC stainless steel. The damper shall be provided with a manual operating lever with locking devices.

3.6.10 The damper in the induced draft fan discharge shall be of the multiblade type constructed of minimum 10 gauge steel and galvanized. The damper shall electrically interlock with the induced draft fan electrical circuit to open when the fan starts and close when the fan stops. A manual automatic switch shall be provided to allow for manual operation.

4.9 Each burner on the incinerator shall be provided with gas-electric ignition and flame safety ultra-violet (UV) scanner. The U.V. scanner shall be furnished and installed to sight both pilot and main flame.

4.10 Pilot burners shall be interrupted type (on for ignition, off during burner operation.)

4.11 Each burner shall have individual manual reset safety valves. In the event of flame failure, the burner affected shall go off on safety. Loss of combustion air or fuel pressure shall shut-down entire furnace. Auxiliary contracts shall be provided in each burner control panel to transmit burner-on, burner off and malfunction or safety shutdown alarm signals to the central panel.

4.12 All active burners on one hearth of the incinerator shall modulate from one control.

4.13 All fuel trains on each burner and the safety system shall conform with Factory Insurance Association (FIA) regulations.

4.14 Burners shall be North American Manufacturing Company, or approved equal.

5. Instruments & Controls

5.0 All existing instruments and controls shall be removed and the Contractor shall furnish and install a complete new system of instruments and controls to record, observe and control the operation of the sludge burning installation.

5.1 It is the intent that the new control system will enable the incinerator to be started, stopped and temperature controlled from the central control panel.

5.2 The installation shall be complete and shall contain all conduit, wiring, tubing, piping, indicating instruments, recording instruments, control instruments, sampling instruments, sensing elements, transmitting elements, analyzer elements, guages, valves, pushbutton station, lights, etc., to give a complete installation, installed connected, tested and ready to operate.

5.3 The Incinerator manufacturer shall furnish and install in the approximate location indicated on the Contract Drawings a central control panel to mount all control, indicating, recording, etc. instruments.

. Auxiliary Fuel System

.0 All existing burners shall be removed from the furnace and new burner boxes installed as specified hereinafter. The existing gas and pilot gas lines shall be revised as required to accept the new system of burners. The refractories and furnace shall be revised as required for proper burner installation.

.1 The fuel burners shall be of the dual fuel burning type designed to burn natural gas or digester gas and shall be complete with burners, valves, controls, meters, strainers, and necessary fuel and combustion air supply piping to the burners

.2 The system shall have sufficient heating capacity to maintain the required furnace temperatures at all times, plus a twenty (20) percent safety factor, and shall be provided with approved safety valves to shut-off the system in event of failure of gas supply or combustion air supply.

.3 All burners shall be sealed-in, nozzle-mix excess air type and be capable of maintaining a stable flame with the pilot light off and an excess air of 600% when burning gas with combustion air supplied at 15 osi for any air fuel mixture between correct air-fuel ratio, and excess air indicated herein.

.4 Burner boxes shall be made of steel or cast iron and lined with not less than three (3) inches of castable refactory meeting ASTM Designation C 401, Class Q, and burner combustion tiles shall be made from high aluminia refractories containing not less than eighty per cent (80%) aluminia or silicon carbide refractories.

.5 Each burner shall be hinge mounted and arranged for easy inspection of the burner tile and burner box.

.6 Burner input to the respective hearths shall be controlled by modulating the fuel supply only, the excess air supply shall not be modulated. All active burners on one hearth of the incinerator shall modulate from one control.

.7 A separate control panel, located at the burners, shall be provided for each burner. The panel shall be constructed of heavy gauge steel and shall contain the fire programming and flame safeguard controls stop-start switch and indicator lights.

.8 All wiring from the central control panel to the local Burner Panels shall be furnished by the incinerator manufacturer.

5.3.1 Instruments shall be suitable for flush mounting.

5.3.2 The panel shall be free standing, totally enclosed and equipped with full length rear access doors, canopy and light. The Panel shall be 90" x 20" and of suitable width to accomodate the requirements.

5.3.3 The panel shall be constructed of minimum 10 guage steel and shall be amply reinforced with structural shapes to present a rigid non-warping surface. Back-up plates and structural shapes shall be provided as required at all panel cut-outs for instruments to rigidly support the weight of the instrument without deformation of the panel or damage to the instrument.

5.3.4 Hinged doors shall be provided on the rear of the panel to provide access to all equipment, wiring, piping, and instruments on the interior of the panel for maintenance, repair or replacement. All doors shall be provided with keyed locks for securing the doors in the closed position.

5.3.5 The control panel shall be constructed to NEMA 12 standards.

5.3.6 Pushbutton stations, selector switches and indicating lights shall be of the heavy duty, oil tight type.

5.3.7 Indicating lights shall have a built-in transformer and a 6 volt, minature, bayonett base, incandescent lamp and shall be of the push-to-test type.

5.3.8 The central control panel shall be completely wired and piped internally under this item. All internal wiring shall terminate in terminal blocks suitably numbered and identified.

5.3.9 All internal piping, tubing, etc., to be connected to exterior piping, tubing, etc., shall be terminated in a suitable bulkhead connection and properly numbered. All wiring, piping, tubing, etc., shall be neatly arranged and supported inside the panel. All openings shall be plugged and protected during shipping and installation.

.3.10 A 115 volt, single phase, 60 Hertz electrical service will be supplied to the terminal strip in the panel under another section of this contract. If other voltages are required, suitable transformers shall be provided as part of the panel.

.3.11 Clean, filtered and dried compressed air at approximately 90 psig will be provided to the bulkhead terminal under another section of this contract. If pressures other than this are required, suitable pressure reducing valves shall be supplied.

5.3.12 The exterior of the panel shall be manufacturer's standard finish and shall be properly protected for shipment and installation.

5.4 One (1) continuous multipoint recording pyrometer shall be furnished and installed having a minimum of 11 points, and shall successively record temperature from thermocouples located as follows:

Points 1 through 6 inclusive - Incinerator Hearths 0 - 5

Point 7 - Flue Gas Scrubber Inlet

Point 8 - Flue Gas Scrubber Outlet

Point 9 - Incinerator Central Shaft Cooling Air Inlet

Point 10 - Incinerator Central Shaft Cooling Air Outlet

Point 11 - Incinerator Exhaust Stack Outlet

5.4.1 Each recording pyrometer shall be a Honeywell or approved equal Electronik 15 unit designed to record temperatures at each of 11 points at least once every two (2) minutes.

5.5 Thermocouples shall be installed in locations as specified hereinbefore to obtain a representative temperature of the gases in the chamber, duct, breeching, etc., in which the temperature is to be sensed.

5.5.1 Thermocouples shall be Type K (chromel-alumel) alloy designed to operate continuously over a range of 0 to 2300 degrees F and be provided with an inconel protecting tube and be complete with element, element insulators, terminal block and terminal head with threaded cover and gasket.

5.6 High limit emergency control shall be provided to limit the inlet temperature to each incinerator induced draft to a maximum of 600 degrees Fahrenheit. The flue gas temperature out of each scrubber (inlet to induced draft fan) shall be limited by comparing an input signal from a thermocouple to a manually established set point in the controller. The generated error signal shall, through an electric to pneumatic relay with manual reset, open the emergency by-pass damper and through an electric interlock system stop the incinerator induced draft fan, the incinerator burners and the combustion air supply fans.

5.7 The incinerator exit pressure shall be controlled by comparing an input signal from the draft pressure sensor at the incinerator outlet and input signal from the continuous oxygen analyzer to an automatic, established set point on the controller. The generated error signal shall, through a pneumatic draft pressure set point controller, position the pneumatically operated normally open damper in the incinerator induced draft fan inlet to maintain the draft pressure at the set point.

5.7.1 Ammeters indicating the current being drawn by each induced fan motor shall be located on the central panel adjacent to the manual control.

5.8 The temperature on each fired hearth shall be controlled by comparing an input signal from a hearth thermocouple to a manually established set point in the controller. A generated error signal shall control the modulating fuel control valves in the fuel system to maintain the hearth temperature at the set point.

5.9 The auxiliary sludge combustion air supply to each incinerator shall be controlled by comparing an input signal from the oxygen analyzer to a manually established set point on the controller. The input signal shall be used to establish the automatic set point of the incinerator exit pressure to maintain the proper relationship of the combustion air supply and incinerator exit pressure.

5.9.1 The generated error signal shall, through an electric to pressure transmitter, position a pneumatically operated damper in the auxiliary sludge combustion air supply duct to the hearths to maintain the oxygen level in the incinerator flue gases at the set point.

5.10 The dampers in the incinerator induced draft fan discharges shall be interlocked with the electrical circuit of the induced draft fan to close when the fan stops.

5.11 The Contractor shall supply and install a multipoint, indicating gauge, pointer type, for semiflush mounting on the central control panel.

5.11.1 The pressure or draft shall be measured at the following points on each incinerator:

1. Central shaft cooling air supply to I.D. fan inlet.

2. Bottom hearth.

3. Top Hearth.

5. Incinerator induced draft fan inlet.

6. Incinerator induced draft fan outlet.

7. Central shaft cooling air supply fan discharge.

8. Incinerator burner excess combustion air fan discharge.

9. Sludge combustion auxiliary air fan discharge.

5.11.2 The draft gauges shall indicate the pressure in inches of water, with a range to suit the application. They shall have extra long bells or other adequate protection against sudden fluctuations of draft.

5.11.3 The draft gauges shall be equal to the Multi-Pointer gauges as manufactured by Bailey Meter Company or the Pointer Draft Gauge as manufactured by Honeywell, Inc., or the approved equal.

5.12 An oxygen and combustible gas analyzer system shall be furnished and installed for the sludge incinerator. The gas analzyer system shall operate as a complete system to draw samples of flue gas being emitted from the hot gas outlet breeching of the incinerator and shall cool and wash the gas sample, pump the gas sample to the analyzer, analyze the sample for oxygen and for combustible gas content, at the hot gas outlet breeching of the incinerator and to transmit, indicate and record the analysis on a receiving and recording chart.

5.12.1 The flue gas sample from the outlet breeching shall be continuous and be recorded and the oxygen content indication used to control the excess combustion air supply and incinerator exit pressure as hereinbefore specified.

5.12.2 The sampling system equipment with analyzer shall be mounted in suitable multiple mounting panels, located as indicated on the Contract Drawings, or directed by the Engineer. Recorder instruments and selector switches shall bemounted in the central control panel.

5.12.3 The gas analyzers shall be equal in all respects to the Continuous Oxygen and Combustible Analyzer, and Gas Sampling System, as manufactured by the Hays Corporation. The work of this item shall also include all auxiliary water, hydrogen, air, electrical and other supply lines and appurtenances required by the system.

5.13 A smoke density meter shall be furnished and installed as indicated on the Contract Drawings. They shall be the Hays Model 912 A or approved equal and come complete with light source, photoelectric receiver, transmitter and indicator for mounting on the central control panel.

5. Incinerator induced draft fan inlet.

6. Incinerator induced draft fan outlet.

7. Central shaft cooling air supply fan discharge.

8. Incinerator burner excess combustion air fan discharge.

9. Sludge combustion auxiliary air fan discharge.

5.11.2 The draft gauges shall indicate the pressure in inches of water, with a range to suit the application. They shall have extra long bells or other adequate protection against sudden fluctuations of draft.

5.11.3 The draft gauges shall be equal to the Multi-Pointer gauges as manufactured by Bailey Meter Company or the Pointer Draft Gauge as manufactured by Honeywell, Inc., or the approved equal.

5.12 An oxygen and combustible gas analyzer system shall be furnished and installed for the sludge incinerator. The gas analzyer system shall operate as a complete system to draw samples of flue gas being emitted from the hot gas outlet breeching of the incinerator and shall cool and wash the gas sample, pump the gas sample to the analyzer, analyze the sample for oxygen and for combustible gas content, at the hot gas outlet breeching of the incinerator and to transmit, indicate and record the analysis on a receiving and recording chart.

5.12.1 The flue gas sample from the outlet breeching shall be continuous and be recorded and the oxygen content indication used to control the excess combustion air supply and incinerator exit pressure as hereinbefore specified.

5.12.2 The sampling system equipment with analyzer shall be mounted in suitable multiple mounting panels, located as indicated on the Contract Drawings, or directed by the Engineer. Recorder instruments and selector switches shall bemounted in the central control panel.

5.12.3 The gas analyzers shall be equal in all respects to the Continuous Oxygen and Combustible Analyzer, and Gas Sampling System, as manufactured by the Hays Corporation. The work of this item shall also include all auxiliary water, hydrogen, air, electrical and other supply lines and appurtenances required by the system.

5.13 A smoke density meter shall be furnished and installed as indicated on the Contract Drawings. They shall be the Hays Model 912 A or approved equal and come complete with light source, photoelectric receiver, transmitter and indicator for mounting on the central control panel.

5.14 Each fuel system shall include an independent meter to and transmit the total fuel consumed by the incinerator. A by-pass loop with valves shall be provided for each meter. Meters shall be of the turbine type or liquid type, having sufficient capacity to measure the maximum flow to the incinerator. Meter shall be provided with an impulse head to transmit the reading to a direct reading totalizing register.

5.15 The central shaft drive mechanism of the incinerator shall be provided with a tachometer transmitter and a speed indicator to indicate the rotative speed of the central shaft.

5.16 A round chart indicating recorder shall be furnished and installed on the main control panel to indicate and record the feed rate to each furnace. The recorder shall receive its signal from the weightometer device furnished under another contract and shall have a range of 0 to 4 tons per hour. The recorder shall be wired under this section from the weightometer area to the control panel. The incinerator supplier shall specify the signal required and the supplier of the weightometer shall furnish and install any necessary transducers, etc. at the weightometer to supply the proper signal.

One clock shall be mounted in the panel and shall have a (12) twelve inch diameter illuminated dial with a hinged cover on the panel face. The clock shall be electric driven with "Telechro" or approved equal movement and shall be equipped with a sweep second hand.

5.17 ALARM DEVICES AND SWITCHES

Shaft rotation shall be monitered by a "telltale" device to signal any interruption of the shaft rotation. A normally open auxiliary contract shall be provided on the instrument panel as part of the relay devices to interlock the feed conveyor system.

A remote indicating temperature control device shall be located at the scrubber inlet. It shall be complete with a high alarm switch wired to sound the alarm on reaching the set point and shall at the same time be interlocked with any necessary relay to stop the induced draft fan and open the emergency vent.

Ash level shall be monitered in the storage bin by a device to sound an alarm on high level.

Structual Requirements

The Contractor shall furnish and install or modify within the limits shown or specified, all structural steel beams, slips, supports, floor gratings, floor plates, stairs, pipe railings, ladders, and miscellaneous metal work necessary for the proper completition of the incinerator modifications and for adequate access and working space for all the equipment included. Demolition and removal of existing equipment shall be the responsibility of the contractor.

Nichols Engineering & Research Corporation

ALARM SYSTEM

Multipoint annunciator alarm system shall be furnished complete with 2" by 3" backlighted illuminated nameplate suitably titled and of a number sufficient to accommodate all the necessary alarm points including all burners while also providing for two spare points. The system shall incorporate an alarm horn complete with loudness adjustment, acknowledge and test pushbuttons, flasher and plug-in modules. The sequence of operation shall be the following:

	Condition Normal	Condition Alert	Annunciator Silenced	Condition Returns to Normal
Visual	off	flashing	steady bright	off
Audible	off	on	off	off

The system shall be equal to that manufactured by the Scan Instrument Corporation, solid state series 70 annunciator.

Electrical Work

.0 All electric material and equipment installed under this section shall be the products of established and reputable manufacturers, shall be new and of first class construction, shall be designed and guaranteed to perform the service required, and shall bear the label of approval of the Underwriters' Laboratories, Inc., where the label is available for the items involved.

.0 The electrical installation shall be made in a neat and workmanlike manner in accordance with the best practice of the trade and shall conform to the requirements of the Electrical Code of the State of Ohio, County of Cuyahoga, and the City of Rocky River, the National Electric Code, and to any other applicable state and local codes.

.0 The Contractor shall furnish and install at the locations shown on the Contract Drawings, a central control panel as specified hereinbefore for the mounting of instruments and controls. Under this paragraph, the Contractor shall install and connect up complete all electrical conduit and wiring for control and for recording and indicating instruments between the central control panel and the sensing and transmitting devices and between the central control and the controlled device.

Nichols Engineering & Research Corporation

Piping, Valves and Appurtenances

The Contractor shall furnish and install or modify all protected water, potable water, final effluent water, gas, compressed air, grease, instrument air, etc., piping and valves serving the incinerators and scrubbers from supply lines within the incinerator area as shown on the Contractor Drawings.

K. Spare Parts

The Contractor shall furnish the following spare parts with each part packed in a container and properly marked by item number, etc., to facilitate identification.

2 Pens for each multipoint record supplied.

2 Pressure switches of each type used.

2 Relays of each type used.

6. Spare bulbs for each type of indicating and alarm lights used.

3 Spare fuses of each type used.

6 Spare thermocouples.

1 Spare relay shall be supplied loose for every four (4) relays used.

One years supply of charts and ink shall be provided for each recording instrument.

Nichols Engineering & Research Corporation

J. Insulation

1.0 The Contractor shall furnish and install all exterior insulation required for equipment, flues, duct and other appurtenances supplied under this Contract, so as to provide sufficient retention of heat, to prevent condensation, and to insure that the temperature of exposed parts shall not exceed one hundred eight (180) degrees F.

L. Manuals and Drawings

1.0 After award of contract, and before construction and operation, the Contractor shall furnish to the Engineer, for approval, drawings and information showing dimensions, layout of equipment, materials, method of assembly, capacity, operating characteristics, and all data necessary to judge as to the conformity of the equipment and work with the intent of the Contract Drawings and Specifications.

1.1 The Engineer's approval will cover the general conformity with the intent of the Contract Drawings and Specifications.

1.2 The Contractor shall be responsible for the detailed design, dimensions and the proper functioning of all equipment and the installation.

2.0 The Contractor shall provide five (5) bound copies of Operation and Maintenance Instruction Manuals.

2.1 The Manuals shall cover the operating, lubrication and maintenance instructions for all individual items of equipment in the installation.

2.2 Process operations instructions cover the system operation, including start-up, warm-up, adjustment, burning and control of the system, and all its auxiliaries.

M. Erection, Performance, Testing and Warranty

1.0 Erection

1.1 The Contractor shall furnish personnel that are qualified and experienced in the design, manufacture and installation of facilities similar to that specified herein to supervise the field installation and erection of all equipment.

1.2 Supervision shall be provided during all times that work is being performed on the installation of erection.

2.0 Testing

2.1 Upon completion of the erection and installation, the Contractor shall notify the City and the Engineer that the incineration equipment is ready to be placed in operation and tested.

2.2 As a general requirement of the performance of the sludge cake incinerator installation during the testing period, the incinerators shall be capable of evaporating the contained moisture of the sludge cake and shall burn the solids thereof to a sterile ash containing not more than four (4) percent by weight of volatile matter. During this process, and inclusive of starting, shutdown and standby periods, the operation shall be free from nuisance of dense smoke, acid or other fumes, noxious gases, strong odors, excessive dust, dirt or fly ash.

2.3 The operation shall be subject to the requirements of the State of Ohio, County of Cuyahoga, City of Rocky River, and such other codes, laws or ordinances which may apply, and to the provisions of paragraph 3.0 herein.

2.4 In addition, the incinerator shall be capable of being shutdown if a malfunction occurs during operation at full design capacity under full by-pass.

2.5 The incinerator shall be tested for a minimum of two (2) continuous days each.

2.6 During this period of testing, the Contractor will be responsible for the installation, and shall make such adjustments and changes which he may find necessary for the proper operation of the installation, provided, however, that no such changes shall be in conflict with the requirements of this specification.

2.7 During the period of testing, the City will furnish all necessary sludge cake, fuel, water, electric power, labor and supplies free of expense.

2.8 The Contractors representative shall instruct and direct the City forces, and shall remain responsible for the installation and its operation and for making any changes, repairs or replacements, provided, however, that should such repairs or replacements be required by reason of the negligent acts or omissions of the City which are contrary to the instructions or directions of the Contractor, then the Contractor will be reimbursed by the City for the cost of such repairs or replacements.

3.0 Warranty

3.1 For warranty purposes the installation shall:

a. Burn the sludge cake as received at the rate of design rated load and seventy-five (75%) percent excess air.

b. Reduce the sludge cake to a sterile ash containing not more than four (4) percent of volatile matter by weight.

c. Be capable of maintaining sufficient temperatures in the burning areas to reduce the sludge cake to a sterile ash as required in Paragraph "C", "Capacity of Installation."

d. Produce a stack emission opacity not to exceed Ringelmann No. 1.

e. Particular discharge to the atmosphere shall not exceed 1.3 lbs per ton of dry solids charged to the incinerator.

f. Reduce the flue gas discharge temperature to the atmosphere to 110 degrees Fahrenheit, measured at the induced draft fan inlet.

3.2 In the event that fulfillment of warranty is not demonstrated by the test runs as herein specified, the Contractor will be permitted to make such changes in equipment and/or methods of operation as he may deem necessary and as may be approved by the Engineer. Following this readjustment, the manufacturer shall make a second test run similar to that of the first run except that, if so ordered by the City the second test shall be extended to include a total period of test up to two (2) calendar weeks.

3.3 The Contractor shall, at no additional cost to the City provide and pay for the services of an independent and approved testing laboratory acceptable to the City to make all required chemical analysis during the warranty and acceptance tests. At least four (4) samples of sludge cake and ash shall be obtained during each hour and a composite sample of the four (4) samples gathered during each hour shall be tested.

3.4 The Contractor shall, at no additional cost to the City provide and pay for the services of a recognized and approved air pollution testing organization acceptable to the City to conduct the air pollution tests and prepare the test data and result for submission to the City and the Engineer for approval. Six (6) copies shall be submitted.

3.41 The Contractor shall provide all test openings, supplies, materials, power, fuel, structures and actual testing, exclusive of set-up time, shall be conducted for a minimum of two (2) eight (8) hour days, per incinerator.

Estimated Capital Cost

Our estimate of the capital cost for the modification work per the preceeding specifications on an installed basis is $450,000. - $500,000.

After the preparation of drawings and specifications by your Engineer, we will be in a better position to provide a refined estimate. This effort will be necessary to define the scope of the modification you elect to proceed with.

Nichols Engineering & Research Corporation

N. Data To Be Submitted With Proposal

1.0 The Bidder shall submit with his Proposal a certified experience record of the incineration equipment he proposes to furnish.

2.0 Heat balances based upon gases leaving the furnaces at not less than 800°F. using a minimum of seventy-five percent (75%) excess air.

3.0 Any other data which the Engineer deems necessary to properly evaluate incineration equipment, operating and maintenance costs shall be furnished upon request.

4.0 The Bidder shall submit with his Proposal a description of the incineration equipment offered and a complete list of all electric motors required. This listing shall include rated horsepower and characteristic power requirements of each motor.

5.0 The Bidder shall submit with his Proposal, layout drawings showing the proposed arrangement of incineration equipment in the Sludge Disposal Building, if different from Contract Drawings.

Mr. ROE. Thank you very much for your testimony. We appreciate your presentation. We will look for that other information, and we need it to build a foundation to proceed with this.

Mr. FEIGHAN. We will have it at your offices within a week or so.

Mr. ROE. Fine. Thank you.

The committee will recess now until 1:15.

[Whereupon, at 12:25 p.m., the subcommittee was recessed to reconvene at 1:15 p.m. the same day.]

AFTERNOON SESSION 1:18 P.M.

Mr. ROE. The subcommittee will reconvene.

We have as our next witness, Mr. Donald A. Holt, Jr., joint chairman of the boards of directors of the Orange County Sanitation Districts, Calif., accompanied by Mr. Wayne Sylvester, assistant general manager, Dr. Douglas Segar, scientist, and Lee C. White, Washington counsel.

We have that for the record now and we want to welcome you to our hearings.

The full text of your prepared statement will appear in the record at this point.

[Prepared statement referred to follows:]

AUTHORIZING OCEAN DISPOAL OF SEWAGE SLUDGE UNDER THE CLEAN WATER ACT

(Statement by the County Sanitation Districts of Orange County, Calif.)

Summary

Ocean disposal is one appropriate option for sewage sludge management which the National Academy of Sciencies (NAS), National Advisory Committee on Oceans and Atmosphere (NACOA), and other groups have recommended should continue to be used contingent upon the sludge and local oceanographic conditions. Ocean disposal of sewage sludge from barges is permissible under the Marine Protection, Research and Sanctuaries Act, yet the Clean Water Act prohibits identical disposal operations from a shore-based pipeline. A strong case can be made for reconciling this statutory conflict, and we recommend that the Clean Water Act be amended to allow ocean discharge of sewage sludge, provided that it will cause no unreasonable degradation of the marine environment or endangerment of human health. A preliminary step that Congress could take is to authorize the Administrator of EPA to grant a limited number of five-year research permits to coastal publicly-owned treatment works (POTW's) for the purpose of determining under what circumstances, if any, pipeline disposal of sewage sludge can be allowed.

Over the past two years, the County Sanitation Districts of Orange County, California (CSDOC) and the National Oceanic and Atmospheric Administration (NOAA) have jointly funded a research planning study by scientists from the California Institute of Technology (CalTech) and other major marine science institutions in Southern California. Joint municipal-federal research efforts, such as the CalTech study, are an appropriate mechanism for focusing scientific effort on the major waste disposal problems facing many coastal municipalities, and the shared funding arrangement gives the municipality a greater role than it has traditionally played. Under a research permit provision, CSDOC would construct a new ocean outfall to far greater depths than has ever been built before and would support an intensive, seven-year research effort (two years pre-construction and five years post-construction) intended to predict and monitor the impacts of such an outfall on the marine environment. If the marine monitoring program revealed unacceptable deleterious effects, the ocean discharge would be terminated immediately. In any event, while constructing and studying the pipeline discharge, CSDOC would continue its search for the best available land alternative for sludge disposal. The ultimate success or failure of the deep ocean discharge would be judged through a comprehensive multimedium assessment which would demonstrate whether this alternative was preferable to others, including land-based, that may be available to Orange County. This

assessment would take into account human health risks, environmental effects, process economics, and public perception of the alternatives.

I. INTRODUCTION

One of the most troublesome byproducts of our Nation's effort to clean up its waterways is sewage sludge. The major constituent of sewage sludge generated by POTW's is naturally occurring organic material. This organic material is removed from our wastewater effluent streams because the principal pollution problems in inland waters are caused by the biochemical oxygen demand of this material. Sludges also contain trace concentrations of synthetic organic compounds, heavy metals, and some petroleum-related hydrocarbons. These contaminants are often grouped together for the purposes of discussion and legislation under the heading of "toxics."

Recent estimates indicate total U.S. POTW sludge production is on the order of seven million metric tons per year.[1] The costs of sludge management by these POTW's varies from about $20 up to $500 per dry ton.[2] At $130/ton (EPA's "typical" figure), over $900 million per year is estimated to be spent in operating costs nationwide. For many POTW's, sludge management represents over one-half of their operating budgets. Despite this economic burden, an ever-increasing number of POTW's are finding the costs of sludge management to be a relatively minor concern compared to the logistical and public acceptance aspects of sludge disposal. Spurred by the discovery of hundreds of unmanaged hazardous waste sites all over the country, public concern for groundwater contamination is making it exceedingly difficult to obtain new sites for land disposal of sludge or, in many cases, even to continue the use of existing sites, even though sewage sludge is not a hazardous waste.

In the early 1970's, public opinion called for a national policy to restrict or ban all ocean disposal of sludge. At present, we seem to be just as intent in our efforts to restrict or ban many forms of land disosal. In the 70's, EPA and the California Water Quality Control Board took the position that no sewage sludge could legally be disposed in the ocean, without regard to the human health or environmental consequences of the alternative disposal methods and without regard to the quality of the sludge or the assimilative capacity of the ocean. Quite clearly these attitudes were emotional and instrinctive, rather than reasoned and scientifically based. Eighteen months ago, Judge Abraham Sofaer struck down EPA's arbitrary ocean disposal ban under the Marine Protection, Research and Sanctuaries Act (MPRSA) in *City of New York* v. *EPA*.[3]

In the past few years, NOAA, NAS, NACOA, and many prominent members of the marine science community have expressed the belief that the coastal oceans have the capacity to safely receive and disperse some of man's wastes, including sewage sludge, without unacceptable ecological effects: in other words, the oceans have an "assimilative capacity." We submit that the majority of knowledgeable marine scientists would agree that the coastal oceans possess some finite capacity to accept wastes, particularly natural materials such as sewage sludge. The NACOA report, issued in 1981, underscores this weight of scientific opinion in its strongly-worded recommendation:[4]

"NACOA recommends that *ocean disposal of sewage sludge either by barge or through properly designed outfalls should continue to be a disposal option* under appropriate management conditions and with adequate monitoring safeguards in those areas where no unreasonable degradation of the environment results from sludge disposal." (Emphasis added.)

CSDOC believes that coastal POTW's are obliged to consider ocean disposal among the other options for sludge management, and we believe that there are several potentially acceptable options for ocean disposal of sewage sludge off the Southern California coast.

II. THE SOUTHERN CALIFORNIA EXPERIENCE

From Point Conception to the Mexican border, a distance of about 250 miles, the largest anthropogenic (man-derived) input to the coastal Pacific Ocean is POTW effluent. In 1979, the five major POTW's in Southern California safely discharged more than one billion gallons of treated wastewater per day into the Pacific Ocean.[5]

In 1969 the five major POTW's in Southern California agreed to fund an ongoing series of environmental studies, designed to measure the effects of ocean disposal of sewage effluent and solids. That agreement produced the Southern California Coastal Water Research Project (SCCWRP), which since 1973 has been headed by oceanographer Willard Bascom. SCCWRP's budget has been augmented over the years with federal and state research grants and their research programs have received critical acclaim from their peers. To ensure theobjectivity of SCCWRP's reports, control of the project was turned over to a commission of local civic leaders and elected officials, all of whom are concerned with environmental quality. The scientific work carried out at SCCWRP is reviewed separately by an independent consulting board of prominent marine scientists. SCCWRP's work, and the other research that has been performed in the region, prompted the former EPA Assistant Administrator for Water, Thomas Jorling, to comment: [6]

". . . [Southern California] is atypical for two reasons. First, it has been the subject of more research . . . than all the others around this country combined, multiplied by several hundred . . . . The second . . . is that going into a California waste treatment system is like into a nuclear submarine; while other waste treatment facilities are more akin to the ironclad Monitor . . . Willard Bascom should feel proud of his work and so should all the communities that have been involved."

Willard Bascom recently published a paper in the peer-reviewed journal Environmental Science and Technology which briefly summarizes the decade of work carried out at SCCWRP. We have attached a copy of the full paper as an Appendix and respectfully request that this paper be printed as part of the record. We will highlight briefly the major conclusions reached by marine scientists in their studies of our 250-mile coastal "laboratory."

Heavy metals.—Heavy metals are found in sewage, with about 90 percent associated with the particulate (solid) phase. About 10 to 12 percent of the metals remain in the vicinity of the discharge; the rest are carried away by the current. Of the portion which remains, the metals are so tightly bound to solid particles that they are practically unavailable to marine organisms.[7] Although there may be elevated levels of metals in marine invertebrates near outfalls, sewage-related metals are not found in any significant concentration in fish muscle tissue (the part eaten by humans). There are some indications that high metal loads in enclosed bays or estuarine systems may result in elevated levels of these metals in invertebrates that could pose a potential hazard to humans, but this is not the case in the open coastal waters of Southern California.[8]

Synthetic organics.—DDT is thought to have been responsible for decimating the brown pelicans on the Channel Islands by adversely affecting their eggshells. Although a major industrial facility discharged DDT into the Los Angeles County sewerage system for years, the DDT discharge was stopped in 1970, and the amount of DDT reaching the Southern California bight through POTW discharges has been reduced to 3.5 percent of its 1971 value. In the same time period, the pelicans have returned to what are believed to be their normal population numbers. Another class of persistent synthetic organic compounds which is of environmental concern nationwide, polychlorinated biphenyls (PCB's), has dropped to 13.6 percent of its 1971 levels in California POTW discharges, even though there was no single source to eliminate, as in the case of DDT.[9] Concern in Southern California is focused on the long-term impacts of the existing deposits of DDT on the Palos Verdes shelf, rather than on current discharges of either DDT or PCB's. As far as both DDT and PCB's are concerned, at least in the open coastal waters of California, marine organisms that take up these compounds appear to be well-equipped to isolate the contaminants within their bodies in such a way as to prevent actual harm to themselves.

The five Southern California coastal POTW's face dramatic increases in sludge production as they put more secondary treatment facilities on-line. The three largest agencies, along with the U.S. EPA and the State of California, initiated an areawide sludge management study in 1976, called the Los Angeles/Orange County Metropolitan Area Sludge Management Program (or "LA/OMA Project"). The original objective of the LA/OMA Project was to evaluate all land-based options for sludge management, including landfilling, composting, solar drying (in desert areas), and thermal destruction. Because EPA policy, at that time, was that ocean disposal of sludge was illegal under both the MPRSA and the Clean Water Act, EPA would not allow federal dollars to be spent examining ocean options.

As the LA/OMA Project got underway, one of the most attractive land disposal options, from both an environmental and an economic perspective, appeared to be the "solar drying basin" option. In this scenario, sludge in its normal 3-to-5 percent slurry would be dumped over the mountains into desert valleys. Land would have been purchased, and the sludge would have been spread on the land to dry in the sun. After the moisture content reached an acceptable level, the dried sludge would have been mixed with non-productive soil to produce agricultural land. Unfortunately, by the time the LA/OMA Project reached the public hearing stage, the people who lived in those desert counties adopted the now-common "not-in-my-backyard" syndrome, and county after county began passing "no sludge" ordinances.

The solar drying basin option was not the only one to bite the dust as the LA/OMA Project progressed to its conclusion in 1980. In the final LA/OMA report, it became apparent that the only land-based options available to the three POTW sponsors would be those that could be implemented on land already owned by the POTW's. By 1980, public opposition to any new sludge facility siting became unusually intense in all of our service areas. Since the City of Los Angeles and Los Angeles County Sanitation Districts had land available on which to construct at least some kind of facility, the LA/OMA Project was able to develop practicable recommendations for them. However, CSDOC was using 20 acres of space at a county-operated landfill on private property. Therefore, we had to begin searching for a new site on which to build a composting facility, which appeared to be our best land-based option according to the LA/OMA report.

The final LA/OMA Report, adopted by both the U.S. EPA and the State of California as a final Environmental Impact Statement, was not able to make a recommendation for Orange County. We did not then, and we do not now, have an acceptable land site for composting. The third (and last) of a series of public meetings that we held on the subject brought out over 600 people, not one of whom favored our choice for a site. As a result of public pressure, our own County Board of Supervisors went on record in opposition to our plans to site a composting facility near their proposed new county landfill—a siting decision made necessary because of the need to bury the composted sludge in a landfill. CSDOC is still in the process of trying to complete its portion of the LA/OMA Study, but we are now looking at less satisfactory methods (e.g., such as co-combustion with municipal solid waste, mechanical composting, and incineration) that could be implemented on land we already own.

III. THE OCEAN OPTIONS

Because of federal and state unwillingness to consider ocean disposal of sludge, the three POTW sponsors of LA/OMA contributed $75,000 to a study of ocean options that was incorporated into the final LA/OMA report. All the sponsors recognized that the ocean option part of the LA/OMA project was clearly inadequate as the basis for a final recommendation, but, in light of the apparent mindset against ocean disposal, it would have been imprudent at the time to commit a larger amount of local public resources to this end.

There are two basic ocean disposal options: ocean "dumping" from a vessel under the MPRSA, and ocean "discharge" from a pipeline under the Clean Water Act. The former is currently allowed, following the *New York City* v. *U.S. EPA* decision, while the latter was expressly forbidden by this Congress in Public Law No. 97-117, overturning the D.C. Court of Appeals' decision in *NRDC* v. *EPA*, 656 F.2d 768 (1981).

Regardless of whether sludge is barge-disposed or piped offshore, one important feature of our submarine coastal topography is the presence of very deep water in a series of submarine basins just offshore. Scientist believe that biological activity in the deep basins (1,500 to 2,000 feet deep) is only a tiny fraction of what it is on the continental shelf, where all of the existing six discharges are located. Therefore, two research efforts were undertaken with the POTWs' $75,000 contribution to LA/

OMA: (1) a survey of biological conditions in two of the deep basins was prepared by SCCWRP,[10] and (2) the Environmental Quality Lab at California Institute of Technology (CalTech) did some preliminary mathematical modeling to predict the fate of sewage sledge if it were to be placed into the deep ocean basins.[11]

The CalTech analysis concluded that the two best options for deep ocean disposal are: (1) sludge outfalls with discharge depths of about 1,000 feet (compared to the 300 foot depth of the Hyperion sludge outfall), and (2) barge disposal at either a fixed or a "roving" discharge location in deep water using a submerged pump discharge between 150 and 300 feet below the surface (to keep the discharged material below the thermocline, but still several hundreds of feet above the ocean floor). No reputable marine scientist, or sewerage agency for that matter, can say with certainty that deep ocean outfalls are the ultimate solution to our sludge problems. The scientific data base for the deep basins is limited even though they are less than ten miles offshore. One remarkable feature of the basins is that they are very low in oxygen; in fact the 260 square mile Santa Barbara Basin, the northernmost of 14 offshore basins, is essentially devoid of oxygen and has been for thousands of years.[12]

The LA/OMA "mini-study" of deep ocean alternatives has provided us with a hint of what might be one of the safest, least environmentally degrading options for sewage sludge disposal. We cannot now close our eyes, or our minds, to the deep ocean options.

IV. THE ORANGE COUNTY RESEARCH PROGRAM

CSDOC has yet to find a site to complete the EIS process started eight years ago with the LA/OMA Project. We currently landfill about 65 dry tons of sludge per day, and, as more secondary treatment goes on-line and our service population grows, we expect this amount to increase to around 150 dry tons per day by the year 2000. Because public pressure appears to have taken away our opportunity for the "optimum" choices for land disposal, we deem it essential to make a thorough analysis of our ocean options. Clearly, an ocean disposal operation is possible and legal by barge, and we are actively considering that option. However, to be able to put sewage sludge at a particular spot in the ocean by barge (at a high operating cost, we might add), but not to be able to put exactly the same sludge in the same spot via pipeline is an anomalous situation at best. Thus, CSDOC has also been exploring the pipeline option.

In partnership with NOAA (which contributed two-thirds of the $85,000 cost), CSDOC sponsored a second phase of the CalTech study to define the research and monitoring that would be needed if a deep ocean sludge outfall were to be built off Southern California. The resulting research/monitoring plan was finished three months ago, and we have provided copies of that document to the Committee.[13] This research plan is briefly summarized as follows:

Two years of pre-discharge studies and five years of post-discharge monitoring would be performed to determine the viability of the pipeline discharge as a disposal method. The total cost of this research effort has been estimated at $1.5 to 2 million per year for seven years.

The study program has been divided into research groupings organized by tasks. The largest group in terms of effort and cost will be one that will seek to detect and document any effects from the discharge. This group will monitor water quality and benthic parameters near the outfall and at control stations both before and after the discharge begins. This information will be used as input to design of the discharge system and to calibration and refinement of predictive models.

Also used as input to the modeling efforts and to the siting of the outfall will be a pre-discharge survey of the bathymetry and currents. This second group's results

[12] Emery, K.O. and J. Hulsemann, "The Relationships of Sediments, Life and Water in a Marine Basin," Deep-Sea Research, 8, 165–180 (1962).

[13] Brooks, N. H., R. G. Arnold, R.C.Y. Koh, G. A. Jackson and W. K. Faisst, "Deep Ocean Disposal of Sewage Sludge off Orange County, California: A Research Plan," Environmental Quality Laboratory, Report No. 21, California Institute of Technology, Pasadena, CA, November 1982, 116 pp.

will be used additionally to design the sampling station network for the continuing studies.

A third group will characterize the nature of the sludge: the quantity and quality of the discharge, the settling or flotation characteristics of the particles in seawater, the degradation of the particles during settling, and the release of contaminants to the water column. This study effort will be used in modeling exercises of the transport, fates, and effects of the sludge in the environment based upon both current sludge production technology and that predicted for the future.

A series of conceptual and computer models predicting the transport and fates of the waste stream in the ocean comprise the next task group. These models will take the discharge plume from its entry into the ocean at the pipeline through the disposition of particles several months after their initial discharge.

Although preliminary modeling by Jackson et al.[14] suggests discharge by the currently proposed pipeline is the best experimental design, a fifth group will, before and after construction, propose a refined location for the outfall and a mode of treatment for the sludge. This group will be considering current technology and costs for various options available in sludge treatment and pipeline engineering.

Group six and seven will explore biological impacts from the discharge, both in the laboratory and in situ. These studies will examine the direct and indirect impacts on the biota from the sewage sludge and its associated contaminants. They will also address the reverse: effects of the biota on the sludge particles and associated contaminants. Laboratory studies will be stressed in the early stages of this effort because of the large expense incurred in in situ deep water research, which is still in its infancy.

The last two groups will concentrate on tasks which are comparative, analytical, integrative, and interpretive in nature. One group will compare the CSDOC discharge with other similar discharges such as LA City's Hyperion outfall which has received extensive investigation. The other group will perform cross-disciplinary interpretation of modeling outputs, compare model predictions with monitoring results, and revise the research plan as information becomes available.

CSDOC is examining the concept that the experimental deep ocean pipeline discharge can ultimately be judged acceptable or unacceptable on the basis of a multimedia assessment of the feasible options. Comprehensive multi-media assessments can be expensive and time consuming since substantial data are required to describe environmetal and human health effects, economics, and social perceptions of a range of waste management options. Fortunately, much of the information required for a multi-media assessment of Orange County sludge disposal already exists in a well-documented form as a result of the LA/OMA Project. The EIS resulting from the LA/OMA Project contains detailed evaluations of a wide range of sludge management alternatives and will form an excellent basis for a comprehensive multimedia assessment which includes the deep ocean pipeline discharge option. The experimental study developed by CalTech will provide most of the essential missing pieces for such as assessment. However, CSDOC will also undertake to continue its studies of land-based alternatives in order to fill data gaps with respect to these options also.

Already we have contracted with SCCWRP to obtain biological, physical, and chemical oceanic baseline data that will be absolutely necessary before any deep ocean sludge disposal option could be implemented. SCCWRP's field investigations began in 1981, at a cost of $165,000 per year which is borne solely by CSDOC.

If one were to be allowed by law how deep an outfall should be built, we cannot say with precision at this point, but we can reach the 1000-foot depth contour about 7½ miles off our present facility. The pipeline would be relatively small (21 to 24 inches in diameter) and would cost between $15 and $20 million in 1982 dollars. CSDOC is prepared to bear the entire cost of building the pipeline, plus any associated sludge conditioning facility that would have to be built onshore. We are treating this effort as a research project, with a large potential savings to our rate-payers if it turns out to be a viable option. If the monitoring program shows deep ocean disposal to be environmentally unsatisfactory, all of the members of our Joint Board (consisting of 40 of the top elected officials in our service area of 1.8 million people) recognize that the pipeline would have to be shut down, and on-site land disposal alternatives implemented expeditiously.

---

[14] Jackson, et al., op. cit.

V. RELATIONSHIP TO OTHER MUNICIPALITIES

A word about the relationship of our proposal to the situations of other POTW's, particularly those in Southern California, is in order. A legitimate question is why this research could not be undertaken at the City of Los Angeles' existing sludge outfall. First, the Hyperion sludge outfall was built in the mid-1950's on the continental shelf in about 300 feet of water, for what were good reasons at the time. SCCWRP's studies show that the buoyant plume from the outfall does not reach the surface, but most of the organic matter does rise into the "photic" zone, which are the shallower waters where primary productivity takes place. This allows the organic matter to be beneficially utilized as food by marine organisms, thus producing large numbers of fish and other organisms. SCCWRP reported that the four largest discharges support about 20,000 metric tons of extra benthic "standing stock." [15] This is readily acknowledged and demonstrated by the party-boat fishermen, who frequent the pipeline "reefs" for the demonstrably greater catches that are made there. However, there remains concern that, although there are beneficial effects of the POTWS outfalls in increased biological production, these beneficial effects may be accompanied by more subtle adverse effects that some fear may be caused by pathogens, trace metals and synthetic organic sewage sludge.

The information gathered by SCCWRP and other scientists at the Hyperion outfall over more than the last decade is the basis on which we are suggesting that a move to deeper waters could produce improved results by isolating the sewage sludge from the photic zone. City of Los Angeles scientists themselves have proposed several modifications to the Hyperion sludge outfall, including the deep ocean proposal, as ways to reduce the outfall's adverse environmental effects. However, Los Angeles is party to a consent order with EPA and the state, under which it is progressing towards full implementation of land-based sludge disposal by mid-1985.

Other geographic regions that would be expected to benefit from deep-ocean outfall research conducted by CSDOC include most of the island POTW's (e.g., Hawaii and the western Pacific islands, Puerto Rico and the Virgin Islands). Also included in this list would be several Alaskan communities and a number of cities in southeast Florida, where the Gulf Stream and deep water are only a stone's throw offshore.

One benefit that could accrue from pipeline disposal of sewage sludge is the purely economic one that would flow to inland cities, and coastal cities where ocean disposal is not possible. If one or more coastal cities could eventually turn to ocean disposal of all or some of their sludge, there will be that much less demand for scarce federal dollars under the Title II Construction Grants program. In addition, competition for the limited land and air capacity for sludge disposal would be reduced. Our colleagues in inland states would be as pleased as we if ocean disposal by pipeline is ultimately demonstrated to be an acceptable option.

VI. LEGISLATIVE ACTION NECESSARY

Members of this Committee are aware of the arguments that were raised in 1977, and then again last year, to absolutely ban ocean disposal of sewage sludge. You are also well aware of the overwhelming scientific evidence, and the logic, that says an absolute ban on sludge disposal in *any* medium cannot be justified on either human health or environmental grounds. We have cited the statements of the National Academy of Sciences and the National Advisory Committee on Oceans and Atmosphere in their call for a balanced, multimedium approach to waste disposal.

In 1981, the D.C. Court of Appeals said that sludge discharges could be authorized under § 301(h) of the Clean Water Act. In December of that year, your conferees reversed that decision legislatively. We do not see how it makes any difference what is discharged under § 301(h), as long as the stringent criteria enacted in 1977 are met. We strongly believe that the ocean option must be kept open, for in some instances it might be the best option. We are pleased to see that it remains open under the MPRSA, and we urge the Committee to recommend amending the Clean Water Act to allow ocean disposal of sludge. Since so little is known about deep ocean disposal, the § 301(h) criteria may be inappropriate for sewage sludge discharge permits. The more general "ocean discharge" criteria in § 403(c) should apply to such permits. We think that the § 403(c) criteria are more relevant to the problem at hand, one reason being that they are practically identical to the ocean disposal criteria under § 102 of the MPRSA. If a blanket sludge discharge provision

[15] Bascom 1982, at 231A.

cannot be enacted now, we respectfully request that language be adopted allowing five-year research permits under § 405 of the Act under the § 403(c) criteria.

We are willing to work with the Committee and its staff in developing language that would allow well-planned research efforts such as CSDOC's to continue so that the Nation can have the benefit of an analysis of ocean disposal of sludge based on sound technical and scientific procedures. A matter of this significance should be considered on the basis of rigorous scientific inquiry, not emotionalism.

Mr. ROE. Please proceed.

TESTIMONY OF DONALD A. HOLT, JR., JOINT CHAIRMAN, BOARD OF DIRECTORS, ORANGE COUNTY SANITATION DISTRICTS, ACCOMPANIED BY WAYNE SYLVESTER, ASSISTANT GENERAL MANAGER; DOUGLAS SEGAR, SCIENTIST; AND LEE C. WHITE, WASHINGTON COUNSEL

Mr. HOLT. Good afternoon. Thank you, Mr. Chairman. I am Donald Holt. I am a council member for the city of Placentia, Calif., and also holding the seat of the chairman of the board of directors of the Orange County Sanitation Districts.

As you noted, with me is Wayne Sylvester, the assistant general manager of the Orange County sanitation districts. Also present are Dr. Douglas Segar, a scientist, and Lee White, an attorney, who have worked with us in the development of our project.

We have all worked toward development of this project.

Mr. Chairman, if I may, I have a very lengthy and detailed formal statement which I would like to have incorporated into the record.

Mr. ROE. Your full statement will be incorporated in the record without objection.

Mr. HOLT. Thank you, Mr. Chairman, and I will attempt to describe our project as briefly as possible and will be available for any questions you or the other members of the subcommittee may have.

Those of us who are involved in handling the sewerage problems of a large metropolitan area—we have more than 2 million people residing in Orange County—have to face the problem of handling our success.

When we are successful in cleaning up our waters, our systems produce a product that has the unfortunate designation of sludge. Sludge, which has some positive uses, is not a product of uniform character, but has many different variations depending upon the industrialization of the area served, the effectiveness of pretreatment programs and other factors.

This sludge must be disposed of as it is generated. What we are faced with is finding a long term, environmentally sound solution.

There are a limited number of options: Using it on land as a fertilizer, burying it in land fills, incinerating it, and disposing of it in the ocean. Unfortunately, there is a general attitude among communities that says, "Sure, we generate and have to dispose of sludge, but don't put it near where I live or work or may want to visit."

We, like countless other agencies throughout the country, have expended a lot of time, money and effort attempting to meet this particular problem, and we will continue to do so. One option that we have explored with considerable interest is that of using a pipe-

line to take a preconditioned, nontoxic sludge to the very deep Pacific Ocean, many miles off of our shore, in a carefully controlled project that would offer an opportunity to secure information, data and statistics that would provide a foundation for informed discussions on the merits of using the ocean as a means of assimilating sludge.

In the 1981 amendments to the Clean Water Act, the conference committee adopted a provision which explicitly prohibited the use of section 301(h) for the purpose of transporting sludge to the ocean.

We do not quarrel with that action inasmuch as, clearly, 301(h) was not intended for that purpose but rather to provide a means of disposing of treated waste water effluent when certain criteria were met.

Regardless of whether an amendment to the act is necessary to authorize a research project of the type we propose, we believe it makes sense to do this through legislative action.

We have developed a proposed pipeline project, working with the National Oceanic and Atmospheric Administration, better known as NOAA, that was designed by the California Institute of Technology, also known as Cal-Tech.

NOAA has contributed two-thirds of the develomental costs, and Orange County has contributed one-third. We believe, as do the scientists and technical people who have examined it, that this project, which is estimated to cost $15 million, would over a 5-year period produce a valuable body of data to assist in the evaluation of the use of a pipeline to the deep ocean as an appropriate option for the controlled disposition of sludge.

Orange County would put up the $15 million in construction money from revenues from its operations. Thus, no Federal funds would be required for construction.

We propose that the monitoring be performed by a group of distinguished marine scientists and biologists under terms prescribed by the EPA Administrator in consultation with the NOAA Administrator; thus management of the research project would be independent of the Orange County sanitation districts.

It is also proposed that NOAA participate in providing the annual monitoring costs, expected to be between $1 to $1.5 million; Orange County proposes to pay $1 million each year toward those costs.

As I indicated, we are exploring all sorts of alternatives in disposing of sludge in our county, but this particular option is increasingly regarded by the scientific community as one in which we simply do not have enough information and data.

After all, there are only three repositories—the air, the land, and the water. We believe that selection of the best environmental alternative should be based on sound scientific data.

We further believe that the project that we have developed will move in that direction, and we therefore urge that the Clean Water Act be amended to make it clear that the EPA Administrator has authority, under carefully limited conditions, to issue 5-year research permits under section 405 of the act.

Thank you, Mr. Chairman, and members of the committee. We would be pleased to answer any questions you may have.

Mr. ROE. Is there any other testimony?

Mr. HOLT. Not at this time, Mr. Chairman.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

This appears to be a very innovative pilot project that could have significant effects on other parts of the country if in fact it proved to be a feasible process of sludge disposal.

Mr. Holt, what will Orange County's responsibility be in the event that the data acquired through this pilot project would indicate that there were unacceptable characteristics to this process and that the levels of discharge would create problems in the Pacific Ocean? What would be then your responsibility?

Mr. HOLT. Thank you, Congressman Packard.

If during the course of the research project—incidentally, this will be administered as I mentioned by a commission that is independent of Orange County sanitation districts—a preponderance of evidence is found and is accumulated that demonstrates there is human health hazards, risks, and unacceptable environmental impacts, the districts will immediately cease that project.

That is a very strong position that I am voicing in representing the board.

Mr. PACKARD. In your statement you indicated that your board of directors is prepared to commit $15 million to this pilot project requiring no Federal funds. Why are you willing to do that?

What evidence do you have at this time that would permit you in your own mind to make that kind of a commitment?

Mr. HOLT. Congressman, our agency takes very definite pride in its reputation. That reputation is not just the district itself, but the people that operate our district for us.

We, as board members, are very proud of them. We feel it is a very progressive, innovative responsibility of our districts to do this. We have in our budget some $2 million a year for continuing various research projects.

More to the point, during the period of time that this research project would be going on where we would be putting the preconditioned sludge in the deep ocean, there would be certain cost avoidances that we are incurring now that would go to offsetting that.

I should add that based on the engineering and oceanographic responses and work to be done, we are confident—I say that even as a lay person that I am confident because I live there and I am very concerned about protecting it—that what we will find through this very controlled discharge will be something that will not be unreasonable and will not be degrading to the ocean environment.

But I think most importantly, there is no current baseline data today available that has had a research project approach that permits comparisons.

I mentioned the reference to cost. It will indeed be very cost effective for our district alone.

We would anticipate saving $10 million a year in taxpayers' dollars operationally. I think something else we have to look at strongly, I believe, it would provide a savings in the precious energy resources that are needed to otherwise dispose of the sludge.

Mr. PACKARD. I understand you are not, therefore, requesting any funding. You are simply requesting authorization to proceed on this pilot project?

Mr. HOLT. That is correct.

Mr. PACKARD. Is that authorization required within the Clean Water Act amendments? Is that the appropriate document?

Mr. HOLT. I believe so.

Mr. PACKARD. Is that the appropriate place to have this authorization?

Mr. HOLT. It is my understanding we do not need the legislative authorization to do this. This has been the means that we have selected to pursue. Possibly either Mr. Sylvester or Mr. White could address our reasoning behind it.

Mr. PACKARD. The question is, Do you believe the best way to accomplish the goal you have is to change the language of a bill there?

Mr. HOLT. Rather than an amendment?

Mr. PACKARD. Either an amendment or change the language of the bill.

Mr. WHITE. We do, Congressman. Perhaps lawyers could argue that the sentence added to 301[h] was applicable to only that particular technique for being permitted and that the EPA Administrator has authority to enter into research projects under other sections of the act.

But we don't delude ourselves. This is a tender, sensitive issue. The decision was made by Orange County to come through the front door and ask for legislative authority to do it properly.

Orange County does not want to run any risk. After all, if they are going to put $15 million worth of Orange County revenues into this, they ought to be reassured they will not be thrown out by a court before the project has run its course.

Mr. PACKARD. I understand. In your statement you indicate that NOAA would participate.

Do you have confidence in their willingness to participate?

Mr. HOLT. Yes, we do.

Mr. PACKARD. I understand that they can dump in other areas and perhaps even in our area, that you could dump sludge into the ocean by virtue of barging it out.

Why don't you take that step instead of just going to the expense of an outfall pipeline?

Mr. HOLT. That is indeed a good question. And, yes, there is the ability to, under current Federal law, go to ocean disposal via barge under the Marine Protection Research and Sanctuaries Act, but yet we are precluded from going out by pipeline.

Mr. Sylvester might address the operational side.

Mr. SYLVESTER. In the long term, the cost of a land-based pipeline would be significantly less than the barging operation would entail.

Mr. SEGAR. If I may, I think it is also important to realize that the pipeline would discharge the sludge well below the zone in the oceans at which most of the life that supports fisheries and the biological communities that are very valuable to us live their lives.

So any toxic materials that are in the sludge will be put into a totally different zone of the ocean than we have ever put them into before. However, the barge approach would introduce the sludge at

the surface of the oceans and the scientific community has many questions as to which is the better way to go, and we certainly need this pipeline project to demonstrate whether in fact the sludge can be safely placed below that critical zone of the ocean.

Mr. PACKARD. So your project is scheduled to have the pipeline go to the floor of the ocean to deposit and not some point in between the surface and the floor?

Mr. HOLT. That is correct. The present project takes it out some 8 miles at a depth of 1,000 to 1,300 feet.

Mr. PACKARD. You are asking this approval from the Federal agencies. If I remember right, the California State government has some approvals required, also.

Supposing the Federal Government approved, but you did not or could not get approvals from the State level. Then what happens? Where would you then be?

Mr. HOLT. Hopefully, we will get the approvals and support from the State. We are currently working to accomplish just that.

The California Ocean Plan indeed does prohibit disposal of sludge. However, the State under the water resources control board is proposing to amend that plan.

The draft EIR on the Ocean Plan recommended in a footnote a change to accomplish that. The statement really sets forth and affirms the board's intent that sewerage sludge residues shall be disposed of in a manner found in each case to have the least adverse impact on the total natural and human environment.

So I don't believe that precludes us in that respect.

Also, the circumstances under which the regional board with concurrence of the State board and the EPA may consider granting an interim permit for ocean disposal of sludge residues, and the conditions for such disposal should include, as an example, an EIR which shows clearly that any and all available disposal methods would result in a greater adverse impact on a natural or human environment, once again in the proposed project.

This is also a major change—will be a major change—in State policy. I had the opportunity of testifying before the State board 4 or 5 months ago in regards to this.

The State board clearly recognizes that ocean disposal must be assessed to determine if it is indeed the most environmentally sound method.

Mr. PACKARD. My last question is, Mr. Chairman, I assume—I will have to assume, this being an approved Federal pilot project, that you would make available to this committee and to other agencies all the documentation and data that would help to determine whether ocean outfall of sludge is a feasible process that can be used in other areas of the country?

Mr. HOLT. Congressman Packard, we would be more than happy to share that information. As a matter of fact; we, through the administration of this program, are asking that there be on the Commission representatives of NOAA, the EPA, the environmental groups and we would have one representative, but that steering board would be made up of those various disciplines.

Mr. PACKARD. It is interesting, Mr. Chairman. This is my day for projects that are in my district. This is the second one.

I think you recognize that we must have a corner at least for today on some waste disposal problems. Just for today, though.

Thank you.

Mr. ROE. The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

First of all, it was about 2 years ago that the Investigation Oversight Subcommittee of this committee was out visiting a wastewater treatment plant and had an extensive hearing going from 10 in the morning to 8 in the evening or thereabouts.

Mr. HOLT. Correct.

Mr. STANGELAND. We are anxious to see what can be done to facilitate a pilot project of this kind. I would ask if you could please describe for the committee or for the record the amount and type of monitoring you intend to perform.

If you would like to document that for the record, fine. Or if you can briefly give it to us.

Mr. HOLT. I think it is important that you indeed know that because of the type of decision you have to make in putting forth the legislation.

I think the best person to answer is Dr. Segar.

Dr. SEGAR. There is a summary of the proposed program included in the testimony for the record that has been presented. The results of a document produced by Cal-Tech is there. It is 80 pages long, and it fully describes the project and has been provided to the committee, I believe.

The design of the project at the moment has been taken to the stage where a considerable number of members of the scientific community have in fact reviewed that overall design and have suggested changes in the design and many of those changes have been incorporated.

The design of specific activities under the project will, of course, change as the project continues. As of this point in time, NOAA is already doing some prestudy site monitoring in the area where the pipeline would be placed.

So this is a fairly well described program.

Mr. STANGELAND. I am advised we don't have the 80 page Cal-Tech document. If you would provide that for us, we would appreciate it.

[The report received follows:]

EQL Report No. 21

DEEP OCEAN DISPOSAL OF SEWAGE SLUDGE OFF ORANGE COUNTY, CALIFORNIA: A RESEARCH PLAN

by

NORMAN H. BROOKS

ROBERT G. ARNOLD

ROBERT C. Y. KOH

GEORGE A. JACKSON

WILLIAM K. FAISST

EQL REPORT NO. 21

November 1982

Environmental Quality Laboratory
CALIFORNIA INSTITUTE OF TECHNOLOGY
Pasadena, California 91125

20-955 O—84——50

PREFACE

Even though the discharge of sludge into the ocean via an outfall is not now permitted, this research plan has been prepared to show what could be learned with a full scale experimental sludge discharge of 150 dry tons/day by the County Sanitation Districts of Orange County into deep water (over 1000 feet).

To provide a wide range of inputs and evaluation, a broad-based Research Planning Committee was established to advise the Environmental Quality Laboratory on the overall content and details of the research plan. Two meetings were held at EQL on:

March 4-5, 1982: The entire Committee
July 19-20, 1982: A working subgroup of the Committee

The entire Committee is listed in Appendix B, with footnotes to indicate meeting attendance. Those unable to come to a meeting were asked to comment on the drafts by mail or telephone. We gratefully acknowledge the members of the Research Planning Committee for their generous help in formulating the research tasks and reviewing report drafts.

The preparation of this volume has been supported by the National Oceanic and Atmospheric Administration (Grant No. NA81RAC00153) and the County Sanitation Districts of Orange County. We thank the representatives of the sponsoring agencies for their valuable assistance, in particular:

NOAA: Alan Mearns, John Calder, Kilho Park, and Lawrence Swanson

CSDOC: Fred Harper, Blake Anderson, and Gregg Pamson

The opinions and judgments expressed in this report are solely the responsibility of the authors. Concurrence of Research Planning Committee members or the sponsoring agencies should not be presumed.

Finally, we thank the EQL staff for their skillful and devoted efforts in assembling this report, often in the face of never-ending changes, in particular, Marcia Nelson for typing, and Theresa Fall for graphics and editorial work.

CHAPTER I

EXECUTIVE SUMMARY

A seven-year research program is recommended to study the environmental and possible health effects of a proposed ocean discharge of sewage sludge via a special pipeline to an unprecedented depth of about 1000 to 1300 feet (300-400 meters) off the coast of Orange County in southern California.

Sludge Disposal Problem

Disposal of sludge presents difficult and costly problems for sewage treatment agencies throughout the United States. Land disposal or combustion requires prior extraction of much of the water from the sludge mixture, at a considerable energy expense. Combustion can cause air pollution; land disposal can result in groundwater contamination. Although land and air disposal are usually considered allowable options, ocean disposal is generally not. More specifically, the discharge of sludge through an outfall pipe is prohibited by the Clean Water Act, as amended in 1981, although barge dumping restrictions and prohibitions under the Marine Research, Sanctuaries and Protection Act are being reconsidered in Congress. Despite existing legal and regulatory restrictions, there is nationwide interest in utilizing marine waters for disposal of municipal sludges, as evidenced by a series of recent reports in which such activity is considered (NRC, Commission on Natural Resources, 1978; Goldberg, 1979; NRC, Marine Board, Assembly of Engineering, 1981; NACOA, 1981).

For many coastal cities, ocean disposal is an attractive alternative not only because it is less expensive than land disposal or combustion of sludge, but also because the environmental effects may be less significant than those resulting from other options.

The County Sanitation Districts of Orange County (CSDOC) collects, treats, and disposes of wastewater for two million people. The treated effluent is discharged through a ten-foot (3 m) diameter outfall with a multi-port diffuser more than 4 miles (6.5 kilometers) offshore at a depth of 195 feet (60 meters). The mean flow rate is approximately 200 million gallons per day (760,000 m^3/d). The performance of this outfall has been excellent with minimal adverse effects.

Residual solids from wastewater treatment amount to 150 tons (136,000 kg) per day (dry weight) suspended in three million gallons of wastewater (1.2 percent solids by weight). This material consists

of anaerobically digested sludge from primary sedimentation tanks and raw waste activated sludge from the secondary treatment process.

Proposed Deep-Ocean Discharge of Sludge

The ocean basins a few tens of miles off the southern California coast drop to depths of over 3000 feet (1000 meters). An earlier Environmental Quality Laboratory report (Jackson, et al., 1979) recommended a depth of about 1300 feet (400 meters), on the side slope of a basin, as the best candidate site for further sludge disposal study. It was felt that environmental effects associated with marine sludge disposal would be minimal at that depth. CSDOC now proposes an experimental discharge of its sludge through a small pipeline terminating 7.5 miles (12 kilometers) from the mouth of the Santa Ana River at a depth of 1000-1300 feet (300-400 m). The pipe (about 18-inches in diameter) would be continuously welded and coated both internally and externally; it could easily be laid from a pipe-laying barge.

Savings attributable to this option would be nearly $10 million per year, including the annualized cost of capital as well as annual operation, maintenance, research and monitoring costs.

The environmental impacts of ocean disposal are expected to be slight, based on what is currently known. We do not anticipate any human health impact or risk. If the research plan presented herein reveals unacceptable impacts, CSDOC will modify or discontinue its ocean discharge operations. Upon termination of the discharge, any sludge-related changes in biological communities are expected to be reversed within only a few years.

CSDOC is currently seeking approval to conduct this experiment through special legislation and/or regulatory actions at both state and federal levels.

Need for Research

Because the CSDOC sludge outfall would be about four or five times deeper than existing wastewater or sludge outfalls, there are special research needs for system engineering and evaluation of environmental effects. The specific goals of this research plan are:

1. To characterize the physical, chemical, and biological properties of the sludge.

2. To recommend: (i) depth and location of the end of the sludge outfall; (ii) in-plant processing of sludge before discharge; and (iii) possible modifications in pretreatment (or source control) programs for trace contaminants.

3. To make pre-discharge predictions of sludge-induced

environmental impacts. These would include changes in water-column oxygen concentrations and benthic sedimentation rates.

4. To observe changes in water column and benthic communities and measure the distribution of important chemicals in the water, in the sediment, and in organisms.

5. To find what human health risks (if any) are associated with deepwater sludge discharge, either directly through human contact with seawater or indirectly through consumption of seafood.

6. To determine the mechanisms by which ecological and chemical changes occur.

7. To assess the predictability of the effects of deep sludge discharge by comparing model predictions with monitoring data.

8. To summarize and recommend methodology for designing systems for sludge discharge into the ocean and predicting the effects.

9. To summarize the effects of the Orange County sludge discharge, and evaluate their significance with respect to marine resources.

Research Plan

To satisfy the goals listed above, a comprehensive research plan is presented, consisting of 41 tasks arranged in nine groups:

Task Group 1. Survey for Discharge-Related Effects (pre- and post-discharge monitoring)
2. Site Characteristics
3. Sludge Characteristics
4. Modeling
5. Preliminary Design
6. Biological Impacts--Laboratory Studies
7. Biological Impacts--*In-Situ* Studies
8. Special Studies
9. Integration, Analysis, and Interpretation

Highlights of the research plan are presented in Chapter 3, and detailed descriptions of individual tasks are in Chapter 4.

Project Organization

The research plan describes the work to be done without regard to who will perform which tasks. Although major parts of the proposed work may be done under grants and contracts to universities and private firms, significant portions would be performed by CSDOC (in-house) and by the Southern California Coastal Water Research Project.

An administrative board, consisting of a representative from each of the funding agencies, would be established to set overall policy to be carried out by a project research administrator selected by the board. Except for in-house work by CSDOC, all the research tasks should be funded through a joint administrative agreement of the various funding agencies (such as NOAA, EPA, the California State Water Resources Control Board and CSDOC). Using funds provided by the sponsoring agencies as a single pool, the project research administrator would carry out the research plan by means of grants and contracts; research proposals would be evaluated with peer reviews.

A research review committee would be established to advise the research administrator on priorities, changes in the research plan, and evaluation of proposals. An annual summary and evaluation of the results would be prepared for the regulatory agencies, CSDOC, NOAA, and other sponsors. Additional administrative details are discussed in Chapter 5.

Thus management of the research project would be independent of CSDOC, the agency which is responsible for building and operating the sludge disposal system. The organizational structure is summarized in Figure 5.1 on p. 94. Regulatory agencies would be responsible for specifying the conditions under which the sludge discharge may continue.

Project Cost

The research project would include two years of predischarge work and five more years of study after the discharge begins. The estimated total research cost is approximately $1.5 to 2 million per year. The breakdown by year and task group is shown in Table 5.1, p.98. These R & D costs are in addition to the usual capital, operation and maintenance costs for the sludge outfall system.

National Significance

National policy for sludge disposal is currently being reviewed, especially with regard to permitting ocean disposal. If the experimental deep-water sludge discharge goes forward as proposed, research and monitoring activities recommended in this report will produce results which are potentially very important to policy-makers. For instance, if related environmental effects are found to be very small, then the ocean discharge option may be viewed more favorably vis-a-vis air and land disposal options.

If ocean discharge of sludge is to be permitted in certain cases, then there is need for better predictive modelling and design methods for deep-water sludge disposal systems. Some of the tasks of this research plan are directed toward developing and improving these capabilities.

CHAPTER 2

PROPOSED DEEP-OCEAN SLUDGE DISCHARGE

The research plan presented in this report is designed to investigate the effects of a proposed discharge of sewage sludge into the ocean at 300 to 400 m depth off the Orange County coast in southern California. Although such a discharge is not now legal, the County Sanitation Districts of Orange County (CSDOC) is seeking approval for a unique research and demonstration project to discharge sludge at that unprecedented depth and to fully study its behavior and effects.

The discharge would consist of 3 million gallons per day of sludge containing about 1.2 percent wastewater solids, or 150 dry tons per day. These solids are very small particles derived from sludge digesters or from the activated sludge process. After discharge, they are expected to sink in the ocean slowly over a wide area.

This chapter is a summary of background technical information related to the proposed research project. Section 2.1 describes the Orange County wastewater and sludge treatment facilities. Section 2.2 discusses the physical and chemical nature of sludge. Characteristics of the receiving water are presented in Section 2.3. Section 2.4 provides a description of oceanographic and chemical processes which determine the fates of sludge and sludge constituents in marine waters. Finally, Sections 2.4 and 2.5 consist of an account, based on existing information, of what will probably happen in an environmental sense if sludge is discharged into the ocean.

2.1 ORANGE COUNTY FACILITIES AND SLUDGE DISPOSAL PLANNING

The County Sanitation Districts of Orange County (CSDOC) serves the wastewater treatment and disposal needs of approximately two million people and various industries in the northwestern portion of Orange County (Figure 2.1). CSDOC operates two treatment facilities -- Treatment Plant No. 1 and Treatment Plant No. 2 which together are known as the "Joint Works." The agency collects and treats an average daily wastewater flow of approximately 200 mgd. All wastewater receives at least primary treatment. A flow of about 125 mgd is also provided with some form of biological treatment (trickling filter or activated sludge). Sludges from these processes are now anaerobically digested and dewatered prior to disposal. Section 2.2 provides a more detailed description of sludge sources and characteristics.

Figure 2.1 Existing CSDOC Boundaries, Treatment Facilities, and Wastewater Outfalls.

Dewatered, dried sludge is trucked to Coyote Canyon Landfill, where the material is further composted to at least 50 percent solids prior to incorporation in the landfill. In 1978, an average of about 120 tons per day of digested sludge (on a dry-weight basis) were disposed of in this fashion. The treated effluent along with centrate from sludge dewatering is discharged to the Pacific Ocean via a 27,400-foot long outfall (including a multiport diffuser which comprises the last 6000 feet of pipe). The discharge depth for treated wastewater is about 195 feet.

In 1974, CSDOC, in concert with other southern California operating agencies, EPA, and the California State Water Resources Control Board, organized the Los Angeles/Orange County Metropolitan Area Sludge Management Project (LA/OMA) to identify and evaluate a wide range of sludge disposal alternatives within the Los Angeles basin. The sludge management program recommended for CSDOC consisted of landfill disposal of digested, dewatered, and composted sludge. The plan carries with it potential environmental costs in terms of land use, groundwater quality, and air emissions associated with truck transport. These and related mitigation measures are discussed at length in the LA/OMA Draft Facilities Plan (1980).

Although much cheaper, ocean disposal alternatives were discarded by LA/OMA (1980) because of (i) federal and state prohibitions against marine sludge disposal (and ineligibility for federal construction grants) and (ii) the need for further monitoring and research to show that environmental impacts would be acceptable. A 400-meter discharge depth was recommended for further study in the EQL report on deep-ocean disposal alternatives (Jackson, Koh, Brooks, and Morgan, 1979).

Research proposed herein will provide a detailed determination of the environmental effects of marine sludge disposal via an outfall to 300 or 400 meters. The program envisioned offers minimal risk of irreversible environmental damage or impacts to human health. Pathways for possible human exposure to trace contaminants or pathogens will be carefully monitored as part of the overall research objective; however, we consider the chances of related health effects to be very remote.

Significant economic benefits would attend marine disposal of sludge instead of land disposal, both to CSDOC and (potentially) to other coastal agencies. Table 2.1 (from Brooks and Krier, 1981) summarizes the estimated capital, annual, and unit costs for land-based and ocean disposal alternatives described previously. The cost of ocean disposal is about one-quarter of estimated costs for the recommended (LA/OMA) land-based alternative.

The reader is cautioned that these are rough cost estimates (in 1981 dollars) which need to be refined by further detailed engineering and planning studies. This report, for instance, estimates that research and monitoring costs would be $1.5-2.0 million

Table 2.1**

Estimated Costs of Digested Sludge

Disposal Alternatives for Orange County

Sanitation Districts* (150 tons/day)†

	Landfill disposal (by truck)	Ocean disposal (by sludge outfall to to 300m depth)
	$ million	$ million
Capital

Special research and monitoring program	-	0.75-1.25
TOTAL, ALL ANNUAL COSTS ($ million)	10.6-11.9	1.75-2.75
COST PER TON† (dollars)	$82-92	$13-21

* Based on preliminary data provided by Orange County Sanitation Districts, Feb. 1981.

\# Based on 10.25% interest, amortized as follows: land, interest only; storage tanks and outfall pipe, 30 yrs; pumping, dewatering and screening equipment, 10 yrs.; trucks, 7 yrs.

† Actual digested sludge discharge is 150 tons/day which is derived from 350 tons/day of raw sludge. For consistency unit costs are given in costs per ton of original raw sludge.

** From Brooks and Krier, 1981.

per year (1982 dollars), which is about twice the cost given in Table 2.1. However, many of the objectives of this research plan go beyond Orange County's disposal problem and serve national needs; thus assignment of only 50 percent to this particular disposal activity is reasonable for purposes of economic comparison. It should also be noted that the research and monitoring expense will drop sharply after the first five years of discharge if the results are favorable.

The proposed sludge outfall for the Orange County deepwater sludge disposal experiment planned herein will consist of a single pipeline (probable diameter 18 to 24 inches) extending from the shoreline a distance of about 12 km to a depth of 300 to 400 m, as shown schematically in Figure 2.2. The exact depth and location will be determined during preliminary design (Task Group 5). The sludge discharge rate will be approximately 3 mgd (million gallons per day), consisting of a mixture of digested primary sludge (0.8 mgd), unthickened waste activated sludge (2.2 mgd) and a small amount of digested trickling filter humus (0.02 mgd). This material may be prediluted with secondary effluent before discharge (perhaps one or two parts per part of sludge). Predilution will both decrease the resulting concentrations of sludge contaminants and simplify the logistics of maintaining a minimum flowrate through the pipeline.

Under present federal laws (the Clean Water Act) and EPA regulations, the proposed sludge discharge (by ocean outfall) is not permitted. California's Ocean Plan (1978) also prohibits ocean discharge of sludge. Nonetheless, the CSDOC is seeking permission for an experimental discharge over a five-year period. The research plan presented in this report is recommended to evaluate the effects of such a discharge and to produce new scientific and engineering information for national use. If the effects are judged to be acceptably small, CSDOC would continue to dispose of sludge in the ocean. On the other hand, if environmental impacts are considered unacceptable by regulatory agencies, the agency would discontinue or modify its sludge discharge.

2.2 THE NATURE OF SLUDGE

As indicated earlier, sewage sludge contains the solids removed during wastewater treatment. Digested sewage sludge is a black liquid containing 2 to 5 percent suspended solids consisting of small organic and inorganic particles in a size range of about 5 to 50 microns. Anaerobic digestion is frequently followed by dewatering and composting. Well composted sludge resembles dark, coarse earth and is sometimes used as a soil amendment.

Most municipal sludges, including Orange County's, contain measurable amounts of trace metals and such refractory organics as pesticides and industrial solvents. Neither dewatering nor anaerobic digestion effectively reduces these contaminants. Marine disposal methods would rely on rapid dispersal to ensure that seawater concentrations of such materials are maintained below potentially harmful levels.

2.2.1 Sludge Sources

Wastewater treatment processes produce a variety of different sludges. Figure 2.3 is a schematic representation of the major process train now used by CSDOC. Typical concentrations of wastewater and sludge solids are indicated at key points. Primary sedimentation removes settleable organic and inorganic materials from wastewater via quiescent settling in large tanks. Floatable materials such as oil and grease are skimmed from the primary sedimentation tanks.

A portion of the primary effluent is treated biologically to capture or oxidize dissolved organic matter and fine particles; resultant biological solids are separated in secondary clarifiers. Secondary sludges (waste-activated sludge and humus from trickling filters) are further thickened and then stabilized by anaerobic digestion in combination with the raw primary sludge prior to dewatering and disposal.

The volume and chemical composition of sludges contributing to the proposed CSDOC ocean discharge are summarized by source in Table 2.2. (Table 2.2(a) gives concentrations, while Table 2.2(b) gives mass emission rates.) CSDOC has proposed to discharge undigested waste activated sludge, but another option would be to thicken and digest waste activated as well as primary sludge before ocean discharge. The latter alternative will be adopted if warranted by projected (estimated) receiving water or sediment oxygen reductions.

Note: Dashed items required only for land disposal of sludge.

Figure 2.3 Simplified flow schematic for activated sludge secondary treatment. (Numerical values represent suspended solids concentrations which are typical of CSDOC system.)

2.2.2 Chemical Properties of Sludge

Sludge chemistry depends upon the nature of materials discharged to the sewer system (i.e., the degree of industrialization within the service area) and the processes used to treat wastewater and sludge. Typically, raw sludge solids within CSDOC are 70 to 80 percent volatile. (Volatile solids are those materials which can be volatilized at 550°C.) Most volatile solids are organic.

Some important contaminants in wastewater are removed by physical, chemical, or biological treatment processes and concentrated in the sludge. More than 90 percent of some trace metals and trace organics from the raw wastewater are found in the sludge. The majority of these, in turn, are associated with particles. Table 2.3 provides typical ranges for trace metal concentrations in sludge as well as data specific to CSDOC. In general, the CSDOC sludges contain levels of major and trace metals which are representative of sludges derived within major U.S. municipalities. Mass emission rates of trace contaminants in CSDOC sludges to be expected following construction of additional secondary treatment capacity are summarized in Table 2.2(b). As indicated in Figure 2.4, mass flow rates of specific trace contaminants have decreased in the CSDOC sewerage system due to recent improvements in industrial waste pretreatment measures.

Nutrients such as nitrogen, phosphorus, and organic carbon are also important sludge constituents. Existing sludge nutrient data are included within Table 2.4.

2.2.3 Physical Properties of Sludge

The physical properties of sludge particles (density, particle size, and settling characteristics) influence their fate subsequent to marine discharge (Koh, 1982; Kavanaugh and Leckie, 1980). The bulk specific gravity of liquid sludge ranges from slightly greater than 1.00 to about 1.02, depending on the solids concentration and type of sludge. Particulate materials within sludge have specific gravities ranging from slightly above 1.0 (biological solids) to about 2 7 (fine sand, silt and clay).

The range of particle sizes in a sludge sample stretches over several orders of magnitude -- from colloids of less than 1 μm in diameter to visible material in the range 50 to 100 μm.

The distribution of particle sizes can vary greatly between samples, depending upon the sludge source and treatment it receives. Figure 2.5 shows a typical cumulative distribution of total volume versus particle size for digested primary sludge. About half the volume of sludge solids (or mass if densities are assumed to be

Trace Metal Concentration Ranges
(mg/kg dry solids)

METAL	CONCENTRATION RANGE	TYPICAL RANGES	TYPICAL CSDOC COMPOSITE
Ag	4 - 150	10 - 50	70
Cd	2 - 1500	20 - 1000	220
Cr	16 - 40000	100 - 1000	440
Cu	52 - 10400	400 - 2000	1400
Fe	6000 - 74000	10000 - 30000	no data
Mn	73 - 39000	100 - 500	no data
Ni	7 - 5300	100 - 500	130
Pb	52 - 26000	200 - 2000	500
Zn	570 - 49000	1000 - 3000	1700

Note: The extremes of concentration on the high side can be traced directly to industrial discharges. The low values generally come from plants receiving only domestic sewage. Values typical of existing CSDOC sludge quality are shown in the third column.

Figure 2.5 Typical particle size distribution for digested primary sludge (Faisst, 1976).

constant) is comprised of particles less than 20 μm in diameter; particles 50 μm and smaller comprise 90 percent of the particle volume.

Prediction of sludge behavior and impacts subsequent to ocean discharge requires information on sludge settling characteristics. Settling is affected by both particle size and density. Measurement of these parameters, however, is difficult, and particle sedimentation is usually characterized with simple settling column experiments. Starting with a uniformly mixed column, sludge concentrations in seawater are sampled over time at a fixed point in the settling column. Changes of solids concentration are then used to develop settling velocity distributions, such as those shown in Figures 2.6 and 2.7 (Faisst, 1980). Figure 2.6 indicates that the mean settling velocity decreases with increased dilution, perhaps due to reduced coagulation effects. They also show that 35 to 70 percent of the sludge particles (by weight) settle with velocities of less than 10^{-3} cm/sec -- less than one meter per day. Thus sludge may spread over wide areas prior to reaching the bottom. It is important to note, however, that two mechanisms participate in the downward migration of sludge particles: (i) gravity settling and (ii) downward diffusion. The second mechanism is significant for particles with small fall velocities ($<10^{-3}$ cm/sec).

Figure 2.6 Fall velocity distributions for digested primary sludge. Sludges were obtained from the County Sanitation Districts of Los Angeles County and diluted as indicated prior to the start of settling column experiments (from Faisst, 1980).

Figure 2.7 Fall velocity distributions for CSDOC digested primary sludge diluted 100:1 with seawater, as determined from samples at two ports along the settling column (Faisst, 1980).

2.3 CHARACTERISTICS OF THE SITE

2.3.1 Bathymetry

The underwater topography off southern California mimics the rugged mountains onshore. The bathymetry is characterized by a number of deep basins with depths of about 1000 meters (Figure 2.8). Deeper portions of these basins are completely surrounded by steep slopes below the sill depths. The various sills connecting the basins vary in depth but are generally several hundred meters deep.

The bathymetry off the Santa Ana River mouth is shown on a larger map in Figure 2.9. Alignments of both the existing Orange County ocean outfall and a candidate deep-water sludge outfall are also shown. The CSDOC effluent outfall is located on a shelf with the diffuser at an average depth of 60 m. Because of the flat slope of the shelf (0.75%), the discharge is nearly 8 kilometers offshore. Beyond 100 m depth, however, the bottom slope becomes much steeper (5%) so that a sludge outfall terminating at 300-400 m depth need only be 12 km in length or about 50 percent longer than the wastewater outfall. Profiles along the lines indicated in Figure 2.9 are shown in Figure 2.10. It is evident that in the alongshore direction (line ABOKL), the candidate sludge outfall terminus is situated on top of a rise, while in the onshore-offshore direction, it is along the slope. Note also that vertical distances are exaggerated 25 times compared to the horizontal scale. One expects advective transport to be mainly in the alongshore direction, i.e., parallel to the bottom contours.

2.3.2 Profiles of Water Properties

Vertical profiles of water properties were measured near the candidate discharge site within the California Cooperative Oceanic Fisheries Investigation (CalCOFI) at their Station 90.28 (in the vicinity of the proposed discharge site) and more recently by the Southern California Coastal Water Research Project (SCCWRP). Profiles representing statistical summaries of CalCOFI data at Station 90.28 (as analyzed by Dr. Tareah Hendricks of SCCWRP) are presented in Figure 2.11. Calculated values for the mean and standard deviation of station measurements, as well as the full range of values encountered within the sampling program, are provided for each parameter. SCCWRP measurements within the preliminary survey described in Appendix A generally fell within the ranges shown in Figure 2.11.

Density stratification in the deeper layer below 150 meters is quite small; the typical gradient of relative density is $2 \times 10^{-6}\ m^{-1}$, and exhibits little temporal or spatial variation within the basins. The dissolved oxygen concentration decreases steadily with increasing depth to over 400 m. At depths between 300 and 400 meters, concentrations range from 0.5 to 1.5 ml/l (0.7 to 2.1 mg/l).

Figure 2.8 The Marine Basins of Southern California (from Bertine and Goldberg, 1977).

2.3.3 Currents

The rugged bathymetry and the hydrodynamic separation of the southward flowing California Current at Point Conception combine to make the current structure in the Southern California Bight very complex. Satellite imagery has revealed clear evidence of large southward migrating eddies shed off Point Conception. Deep drift currents through the deep basins are generally northward (see Figure 2.8).

Data from the depth range of interest for the sludge outfall experiment are scarce, but measurements are in progress at the proposed discharge site. A special set of current measurements was undertaken by SCCWRP during a previous study by the Environmental Quality Laboratory (EQL) (Jackson, et al., 1979). The current meter depth was at 430 m, 40 meters above the bottom, in the Santa Monica Basin. Results are summarized in Figure 2.12. Currents are predominantly parallel to bottom contours. The onshore-offshore motion constitutes almost white noise with only a small peak in the spectrum at the semidiurnal frequency. In contrast, the along-isobath current component exhibits a marked diurnal peak, with an apparent spring-neap cycle, and a peak amplitude of about 0.1 m/s. In addition, flow "events" of a few days' duration occur, with an amplitude of order 0.3 m/s. The latter are presumably topographic waves propagating along the isobaths. Both the diurnal tide and topographic waves may well be general features of the flow in the depth range where the measurements were taken and may be expected to affect the advection and dispersal of sludge at the proposed outfall site. In particular, pollutant transport and dispersion should be much more intense parallel to the bottom contours than normal to them.

The current sequence shown in Figure 2.12 was not measured at the proposed discharge site, but at a similar location in a neighboring submarine basin. Latest measurements at the proposed discharge site during Spring 1982 (personal communication, T. Hendricks) show that there is a persistent upcoast drift flow on the order of 8 cm/sec, or 7 km/day, at 50 m above the bottom. This indicates that advection will disperse sludge particles over a wide area and minimize buildup in the vicinity of the discharge.

2.3.4 Chemistry and Biology

The chemistry of seawater is closely tied to biological processes. The production of plant matter near the ocean's surface causes a depletion of major nutrients and trace metals; it also releases oxygen into the water. The settling of organic matter and its biodegradation in deeper waters produces opposite effects: concentrations of metals (such as copper, cadmium and nickel)

Figure 2.9 Bathymetry of basins near the proposed sludge outfall site. For profiles along the marked lines see Fig. 2.10.

Figure 2.10 Bottom profiles along chosen lines at probable site of deep water sludge outfall experiments (see Figure 2.9 for locations of profiles indicated).

Figure 2.11 Vertical distributions of water properties at CalCOFI Station 90.28 (lat. 33° 29.1'N, long. 117° 46.1'W) near site of proposed deep water sludge outfall experiment. (From analysis by Hendricks of SCCWRP.) Note: Dashed lines indicate range of values observed in experimental programs; ⊢•⊣ indicates width of two standard deviations; and • indicates mean value.

Figures 2.12 Ocean currents measured on Santa Monica Basin slope in water of 470 meters depth. Meter depth 430 meters. (Jackson et al, 1979.)

generally increase with depth; concentrations of oxygen generally decrease. In the southern California region there is an oxygen minimum in the depth range of 400 to 800 m. Oxygen concentrations at the minimum are about 0.4 ml/l (0.6 mg/l), compared to typical surface concentrations of 6 ml/l (8.5 mg/l) (Figure 2.11). Some of the submarine basins in southern California such as the Santa Monica, San Pedro and Santa Barbara Basins draw their deep water from the oxygen minimum layer, have low exchange rates with outside waters, and have high natural oxygen demand. Consequently, their dissolved oxygen concentrations are at times nearly zero. Waters at the proposed Orange County sludge discharge site are less topographically constrained, leading to higher local exchange rates and oxygen concentrations (typically 0.5-1.0 ml/l (0.7-1.4 mg/l) at 400 m and 1.0-1.5 ml/l (1.4-2.1 mg/l) at 300 m). There is some evidence that trace metal concentrations in this region are higher than expected, a consequence of large anthropogenic inputs. The sediments around the proposed outfall site do not contain significant concentrations of sulfide.

The maximum depth for photosynthesis in the Southern California Bight is about 60 m. As a result, the presence of a sludge plume at 300 to 350 m will probably not affect plants or photosynthetic processes. However, some organisms at 300-400 m do depend on the surface layers for food. Some deepwater pelagic fishes and invertebrates feed directly near the surface, rising up during the night and returning to depths during the day. Others feed directly or indirectly on organic matter settling down through the water column.

Preliminary data collected by SCCWRP (Figure 2.13) show no simple depth-related trend for epibenthic organisms collected between 300 and 627 m depth. The benthic fauna in the area of the proposed outfall are not depauperate.

There are no major fisheries at the depth and location of the proposed outfall site. There is a small sable-fishery in the area, focussed primarily at Lasuen Knoll to the south.

2.4 OCEAN PROCESSES DETERMINING TRANSPORT, FATE AND EFFECTS

2.4.1 The Process-Oriented Approach

In the preceding sections we have described characteristics of the sludge to be discharged and the ocean receiving waters. In this and the following section we describe what we think will happen to the sludge after it is discharged.

Environmental scientists analyze problems like this in terms of processes -- physical, chemical, and biological. Some processes, such as the turbulent mixing in the discharge jet, happen very rapidly and in a small space (in just a few minutes over a few tens of meters), and others, like bioaccumulation in the food web, may take years and affect many square kilometers. The rough classification of processes according to "near-field" vs. "far-field", and "short-term" vs. "long-term" emphasizes the range of length and time scales to be considered.

To understand the overall effects of sludge discharge in deep-water in any meaningful way, we must distinguish among the various processes at work. Safe, intelligent use of the ocean for waste disposal will ultimately depend upon mathematical characterization of important oceanographic processes in terms of their effects on waste dispersal and assimilation. The research plan is directed, in part, toward that goal.

As used here, the phrase "transport, fates, and effects" is a shorthand reference to such a process-oriented perspective on waste assimilation. Naturally, our discussion will focus on processes relevant to sludge discharge in the ocean. "Transport" includes those phenomena that move suspended or dissolved materials from one place to another; "fates" is the group of processes that convert water constituents from one form to another and/or cause them to be removed from the aquatic system of interest; and "effects" covers all the biological responses (including those involving human health) which are in some way related to the discharge.

Out of this focus on processes comes the method of analysis called "critical pathways." As the various processes are identified and understood, we can determine which are the most important ones linking a source with an effect -- i.e., the critical pathways. This approach has been used successfully in setting environmental standards for radioactivity, and is now being widely used for other persistent contaminants (e.g., control of PCBs in fish for human consumption).

2.4.2 Description of Potentially Important Oceanographic Processes

This subsection is a qualitative overview of the various processes which may materially affect marine sludge disposal at 300 to 400 m. Although the research plan presented in Chapter 4 consists of 40 separate tasks, it is important to remember that they are all designed either to directly measure environmental impacts in the CSDOC sludge disposal setting or to characterize physical, chemical, and biological processes which bear on these impacts. Figure 2.14 may help in visualizing both the mechanisms described and inter-relationships among the processes of interest; however, this figure is not intended to be all-inclusive, nor is it drawn to scale.

(1) Initial dilution is the immediate entrainment of ambient seawater into the turbulent, buoyant jet issuing from the end of the pipe. The process is normally considered complete when the initially buoyant jet either achieves neutral buoyancy and ceases to rise in the water column, as shown in Figure 2.15, or the plume reaches the surface. Plume submergence (trapping below the surface) depends upon ambient density stratification. For the deep-water sludge disposal experiment, the plume would always be trapped because an adequate degree of density stratification persists throughout the year. Both the magnitude of initial dilution and the maximum height of plume rise can be predicted with reasonable accuracy using discharge and receiving water characteristics as inputs to existing mathematical models (Fischer, et al., 1979). At the completion of the initial dilution process, the sludge-seawater mixture is a neutrally buoyant, drifting cloud, hereinafter referred to as a wastefield.

(2) Passive advection due to ocean currents is the primary means by which the wastefield is transported away from the discharge site following initial dilution. The strength and persistence of currents at the maximum height of plume rise will have profound effects on the ultimate fate of sludge and, in turn, on the viability of the proposed disposal scheme.

(3) Lateral spreading and additional wastefield dilution accompany the advection process. Spreading and diffusion of the sludge-seawater cloud is caused by: (a) gravitational effects (the cloud gets thinner as it pushes out horizontally at the level of neutral buoyancy); (b) shear dispersion (the current speed and direction vary with depth, tending to pull the sludge cloud apart); and (c) diffusion due to turbulent eddies. These three effects are not easily separated, but they all contribute to dilution and dispersal of the waste.

(4) Sedimentation of sludge particles occurs simultaneously with passive wastefield advection and lateral spreading. While sedimentation further reduces the wastefield concentration of particle-affiliated contaminants, the process leads to accumulation of those materials among marine sediments. The particles essentially

Figure 2.14 Factors affecting particulate fluxes and contaminant fates in marine waters.

Figure 2.15 Implication of Proposed Discharge Depth on Wastefield Height of Rise and Intrusion of Waste Into Surface Waters -- Contrasting Geometries between Proposed Sludge Outfall and Existing Wastewater Discharges at 60 meters

"rain out" of the dilute wastefield as it drifts downcurrent. Under the conditions envisioned, fifty percent (by weight) of discharged sludge solids will have fall velocities of less than 10^{-3} cm/sec (<1 m/day). Therefore, it is likely that the process occurs over a long period, during which particles may be transported tens of kilometers. Although sludge particle sedimentation is expected over a large area, sediment accumulation rates will be low outside a small region near the outfall terminus (perhaps within one kilometer) where the small percentage of relatively large, fast-settling particles (>10^{-1} cm/sec or 100 m/day) will collect.

Any particles or oil droplets lighter than seawater will of course rise toward the surface. There is a small fraction of such material in sludge (as yet not determined), but efforts will be made in the treatment plants to eliminate floatable material to the maximum extent possible.

(5) Coagulation (or flocculation) of sludge particles (or sludge with natural marine particles) is a process whereby small particles coalesce into larger, faster settling solids. Coagulation is poorly understood in the ocean, but shear currents and small-scale turbulence enhance the process, whereas high dilution impedes it (because of lower particle concentration and less frequent collisions). The increased ionic strength resulting from the dilution of sludge with seawater probably favors coagulation and accelerates particle sedimentation.

(6) Microbial dieoff (or disappearance) occurs in marine waters due to the combined effects of sedimentation, wastefield dispersion, and bacterial or viral mortality (the sea is a hostile environment to many microorganisms). Because the proposed discharge site is about 12 km offshore and the plume will not immediately impact the surface, there is almost no credible avenue by which pathogens can reach shore, except by gradual upwelling and mixing over periods of days or weeks. During such a period, pathogen concentrations would be reduced to very low levels. Microorganisms attached to particles will be co-transported--gradually sinking for the most part; if there is buoyant material in the sludge discharge (e.g., oil and grease), associated pathogens may reach the ocean surface, and then be advected toward shore by wind-driven currents.

(7) Zooplankton feeding on sludge particles at depth may impact the plankton community or associated food chain in ways which are as yet unidentified. Zooplankton feeding may also accelerate the deposition of sludge constituents by "packaging" them in rapidly settling fecal pellets. The resultant sedimentation pattern for these constituents would be smaller in area, but peak fluxes of particulates and outfall-related contaminants would be higher.

(8) Bacterial degradation of particles and dissolved organics of sludge origin will consume dissolved oxygen in the water column. If currents carry sludge into the deeper basins, particles may have to

settle several hundred meters in order to reach the bottom. During this long settling period, a significant fraction of the particulate organic carbon discharged may be oxidized to carbon dioxide with attendant oxygen consumption (Jackson, 1982).

Oxygen consumption kinetics at the relatively cold temperatures (<10°C) typical of the proposed discharge depth are not yet characterized. Laboratory tests will yield data needed to develop water column dissolved oxygen predictions. The proposed discharge depth (300 to 400 meters) represents a compromise. Based on previous analyses (Jackson, 1982), this is the deepest water in which ambient dissolved oxygen levels assure satisfaction of discharge-related oxygen demand without risking unacceptably low water column oxygen concentrations.

(9) Mobilization of trace contaminants from sludge particles into the water column will probably result from dilution of sludge with seawater. The oxidation of some environmentally significant trace metals (present in anoxic sludge in their reduced forms) favors dissolution of insoluble metal-sulfide and metal-hydroxide compounds with release of metals into the water column. Desorption and mobilization of metals and refractory organics are also promoted by waste dilution and breakdown of particulate organics. Although this sounds ominous, the net environmental effect of contaminant mobilization may be positive. Expected fluxes of various trace contaminants in CSDOC sludge would be modest (see Table 2.2 (b)), and mobilized metals, etc., could be transferred from the Southern California Bight to the open ocean before unacceptable concentrations develop among local waters or sediments. That is, mobilization of trace contaminants into the water column reduces the rate at which these materials accumulate among local sediments.

(10) Sediment resuspension and bioturbation also play important roles as determinants of sediment character in the vicinity of the discharge. Bottom currents at the discharge site will periodically reach speeds capable of resuspending surface sediments. Such events will tend to destroy the chronology of sediment deposition (by winnowing away or redepositing lighter material on the top), oxygenate surface sediments, deplete bottom-water dissolved oxygen levels and gradually transport sludge materials away from the discharge point toward deeper sediments. Bioturbation by burrowing animals reduces the degree of vertical stratification among sediments and permits sediment oxygenation and other exchanges with the water column by increasing sediment porosity. Together, resuspension and bioturbation may greatly accelerate the release of contaminants from the sediments to overlying waters.

(11) The benthic community structure changes in response to sludge-enriched substrate, favoring a few species at the expense of less pollution-tolerant organisms. Echinoderms and crustaceans are expected to be negatively affected in the vicinity of the outfall terminus. Total biomass may be enhanced significantly

and species diversity reduced over a considerable area. Local patches of surface anoxia may develop in the most highly impacted areas if the transport of oxygen from the overlying water to the sediment surface is insufficient for the requirements of aerobic respiration. Under such circumstances, hydrogen sulfide (toxic to most marine species) may be generated.

(12) Sludge constituents may be a source of chronic toxic effects among populations of organisms which live or feed on the bottom near the discharge site. Signs of chronic toxicity which have been attributed to existing southern California marine outfalls in the past include the incidence of fin erosion and liver enlargement among fish. Acute toxic effects are not expected because of high dilution and wide dispersal of sludge solids.

(13) Although bioaccumulation of specific trace contaminants (e.g., DDT and PCBs) is anticipated among marine organisms exposed to sludge contaminants, the relatively low levels of critical contaminants in CSDOC sludge are not expected to result in unacceptable fish tissue concentrations (in excess of FDA limits, State standards, etc.). Neither will there be adverse ecological effects due to biomagnification in the marine food chain. DDT emissions from the Whites Point outfall system, which endangered local pelican populations a decade ago (prior to elimination of the industrial inputs to the sewer system), were about 6000 times greater than the anticipated mass emission rates from the proposed sludge outfall (Goldberg, 1979, and Table 2.2(b)).

The physical, chemical, and biological processes enumerated above are interconnected in terms of their relevance to marine disposal and waste assimilation issues. Some of them will prove to be unimportant as determinants of contaminant fates and effects in the context of this study. The research proposed in Chapters 3 and 4 will improve our understanding of important natural marine processes so that intelligent decisions can be made in other ocean waste disposal settings, as well as off Orange County.

2.5 ANTICIPATED EFFECTS OF PROPOSED SLUDGE DISCHARGE

With the qualitative discussion of fates and effects (Section 2.4) as background, we can provide a quantitative description of environmental conditions following initiation of the proposed sludge discharge. In this section, we will emphasize near-field mixing behavior, which at this point is more predictable than other aspects of pollutant transport, fates, and effects. Since we do not have the data necessary (currents and fall velocities) to make far-field predictions, our discussion of the far-field is limited to the results of order-of-magnitude calculations.

Figure 2.2 indicates a candidate alignment for the proposed deep-water sludge outfall. It terminates at a depth of 400 m, and will probably consist of a single open-ended pipe of interior diameter 18 or 24 inches. The flow rate of sludge will be 3 mgd (million gallons per day) containing a mixture of digested primary sludge (0.8 mgd); unthickened, undigested waste activated sludge (2.2 mgd); and a small amount of digested trickling filter humus (0.02 mgd). Treated wastewater may be mixed with the sludge to maintain flow velocity and prevent solids deposition in the outfall.

The bulk density of the mixture will be slightly greater than that of fresh water, perhaps 1.005 to 1.01 gm/cc. Nonetheless, it will rise in the midst of the denser seawater at the discharge depth as a buoyant plume. Due to ambient density stratification (see Figure 2.11), the plume will stop rising after reaching its neutral buoyancy level, as illustrated in Figure 2.15. Because of ambient density stratification, the dilute sludge cloud will always be trapped in deep water, never intruding into shelf waters (less than 100 meters deep and within 8 km of shore). The location of the CSDOC wastewater outfall terminus and its rising plume are also shown in Figure 2.15 for purpose of comparison; the wastewater plume remains submerged, again due to density stratification, except during occasional periods in winter.

Calculations using the measured density profile, projected sludge characteristics, and assumed range of predilution (mixing sludge with secondary effluent) indicate that under weak current conditions the plume will rise to a height on the order of 100 meters above the discharge point. The dilution at that point would be on the order of 500:1. When there is a current, the equilibrium height of rise would be smaller and the dilution larger. Over longer periods (it takes only a few minutes for the plume to rise to its equilibrium height), it seems evident that the diluted sludge will spread into the receiving water column over a range of depths due to varying currents. In the expected range of current speeds (see Figure 2.12), the height of plume rise will vary from about 40 meters (relatively strong current, no predilution) to 110 meters (no current, one-to-one predilution with secondary effluent). The dilution of the discharge jet with seawater is found to be relatively insensitive to the degree

of predilution.

Assuming a one-to-one predilution, the diluted sludge is expected to rise in the receiving water to between 50 and 110 meters above the discharge point or, equivalently, to depths of 350 to 290 m (for discharge at 400 m). Seawater dilution of the already prediluted sludge would vary between 450 and 750. If we take a value of 600 and assume that secondary effluent has negligible BOD while the sludge has a five-day BOD of 1700 mg/l, then the BOD in the layer due to the sludge discharge would be 1.4 mg/l (~1 ml/l). Total oxygen consumption given unlimited time might be 50 percent greater, or 2.1 mg/l (1.5 ml/l). As indicated in Figure 2.11, the dissolved oxygen content at those depths is of the same approximate magnitude, indicating that local impacts might be significant. Other sludge constituents will also be reduced by a factor of 2x600=1200; for example, suspended solids will be reduced from about 12,000 to 10 mg/l, a value which is probably several times background.

Following plume rise, further mixing occurs as the plume drifts with the current. We expect the motion to be largely horizontal, and parallel to local bottom contours. Turbulent diffusion at those depths is likely to be slower than near the surface. If we assume that the horizontal diffusion coefficient at depth is 10 percent of surface values, then, using results from Brooks (1960), turbulent mixing will provide additional dilution by a factor of two or three within 12 hours, and a corresponding further reduction of BOD to 0.5 to 0.7 mg/l.

Jackson, et al. (1979) estimated sludge degradation rates under these temperature conditions as 1 percent per day. If the ambient oxygen concentration is 0.5 ml/l, total BOD is 1.5 ml/l, and no mixing occurs subsequent to initial dilution, biological degradation would halve the oxygen concentration of the sludge-seawater mixture in 18 days. Particle removal by settling and mixing processes will decrease this impact on oxygen concentrations.

Based on these calculations, it seems possible that the naturally low ambient dissolved oxygen concentrations will be slightly depressed locally in the diluted sludge field near the discharge point. However, the sludge discharge system will be specifically designed to prevent significant oxygen depletion by various methods during the design phase as more predischarge oceanographic information becomes available. Among the methods of controlling DO depletion are: (1) the BOD mass emission rate can be reduced by digesting the waste-activated sludge component; (2) the outfall depth can be reduced to get the plume into water with more dissolved oxygen; and (3) larger predilutions of sludge with effluent can be employed.

The areal extent of discharge-related impacts among local benthos will depend on many factors, only some of which are now understood. At present, we can state that sludge particles will be widely dispersed in the environment. The bulk of this material may be

dispersed throughout the Southern California Bight since typical particle fall velocities are of the order of 1 meter per day, while characteristic rates of net horizontal advection at the plume height-of-rise are about 7 km per day. Hence benthic impacts are expected to be minor except in a relatively small region near the discharge point. However, we do not have enough information to make quantitative predictions regarding changes in sediments due to sludge particle deposition.

In summary, we can estimate reasonably the short-term fate of sludge near the discharge point. Our capacity for long-term estimation of fates and effects is much poorer and will benefit greatly from information generated within the accompanying research plan.

20-955 O—84——53

CHAPTER 3

OVERVIEW OF THE RESEARCH PLAN

3.1 GOALS OF THE RESEARCH PROJECT

The motivation for discharging sludge at an ocean depth three-to-four times deeper than any previous project is to place this material in a location which is farther removed from biologically productive waters and more isolated from human interaction. The proposed location at 300 to 400 meters depth presents possible risks because biota there are less understood than those near the surface and because the low ambient oxygen concentration at that depth (~1 mg/l) could make the high BOD of the sludge (1700 mg/l, 5-day demand at 20°C) more disruptive there than near the surface.

The research project should be designed to clarify aspects of the behavior and effects of the deep sludge discharge and to provide information to make future decisions regarding sludge discharge to the ocean. The specific goals are:

1. To characterize the physical, chemical, and biological properties of the sludge.

2. To recommend:

- depth and location of the end of the sludge outfall;
- in-plant processing of sludge before discharge; and
- possible modifications in pretreatment (or source control) programs for trace contaminants.

3. To make pre-discharge predictions of sludge-induced environmental impacts. These would include changes in water-column oxygen concentrations and benthic sedimentation rates.

4. To observe changes in water column and benthic communities and measure the distribution of important chemicals in the water, in the sediment, and in organisms.

5. To find what human health risks (if any) are associated with deepwater sludge discharge, either directly through human contact with seawater or indirectly through consumption of seafood.

6. To determine the mechanisms by which ecological and chemical changes occur.

7. To assess the predictability of the effects of deep sludge

discharge by comparison of model predictions with monitoring data. Effects to be determined from the monitoring program include sedimentation patterns, alteration of biota, and changes in water and sediment chemistry. It is pertinent to ask how well the fate of discharged materials can be accounted for in mass-balance analyses.

8. To summarize and recommend methodology for designing systems for sludge discharge into the ocean and predicting the effects.

9. To summarize the effects of the Orange County sludge discharge, and evaluate their significance with respect to marine resources.

3.2 RESEARCH PLAN HIGHLIGHTS

3.2.1. Task Groups

With the overall goals described above in mind, we have developed a research plan of 41 tasks arranged in nine groups according to the general objectives. The detailed enumeration and descriptions of tasks are presented in Chapter 4. The research plan has been developed on the basis of the work to be done without regard to which organization would be performing which tasks (for further discussion of administration, see Chapter 5).

The major task groups, which are interrelated as shown in Figure 3.1, are briefly summarized below:

Task Group 1. Survey for Discharge-Related Effects (9 Tasks)

Comparison of important water quality and benthic parameters measured near the outfall and at control stations, both before and after discharge starts, is the basic method for detecting and documenting the effects of the discharge. With this monitoring data, predictive models can be calibrated and improved. Predischarge monitoring data also contribute to the design of the sludge discharge system. In terms of total effort and cost, this group will be by far the largest.

Task Group 2. Site Characteristics (3 Tasks)

In addition to the usual water quality monitoring data, a predischarge survey of bathymetry and currents is necessary for siting the outfall and the network of sampling stations and for interpreting and modelling the observed discharge-related effects (Task Group 1).

Figure 3.1 Relationships among Generalized Tasks Comprising the Overall Sludge Disposal Experiment.

Task Group 3. Sludge Characterization (4 Tasks)

To understand the transport, fates, and effects in the ocean we must know the quantity and quality of sludge being discharged; the settling (or flotation) behavior of the particles in seawater; the degradation of the particles during their slow descent; and release of trace contaminants within the water column. The properties of the sludge may change with time due to population and industrial growth, pretreatment or source control measures, and improvements in treatment processes.

Task Group 4. Modeling (5 Tasks)

The behavior of the waste stream in the ocean is predicted by a series of conceptual and computer models; each model focuses on particular processes and scales. For example, the initial dilution model covers only the first few minutes following discharge, during which the buoyant plume rises from the end of the outfall, producing initial dilutions of several hundred to one; on the other hand, particle deposition models attempt to describe a process that probably takes months. Such models form a basis for predicting effects, not only for this project but also for future projects.

Task Group 5. Preliminary Design (2 Tasks)

Before the demonstration experiment can proceed, decisions must be made regarding treatment of the sludge and the location and terminal depth of the outfall. These choices involve treatment and pipeline technology and costs, as well as water-quality effects predicted with the models and pre-discharge surveys. Preliminary modeling (Jackson, et al., 1979) favors discharge at approximately 300-400 m depth through an 18 to 24-inch diameter pipe.

Task Group 6. Biological Impacts -- Laboratory Studies (4 Tasks)

Because routine field surveys are not sufficient to understand biological processes, specific laboratory experiments are necessary to investigate biologically-mediated pollutant transformations and biological sensitivities to pollutants. Results of such experiments yield important parameters which are needed for developing good predictive models for sludge effects.

Task Group 7. Biological Impacts -- In-Situ Studies (5 Tasks)

The purpose of field experiments is similar to that for Task Group 6, but there are some experiments which simply cannot be done outside the natural system (e.g., benthic oxygen consumption). Because of the large depths involved, in-situ experiments are difficult and costly, and can be pursued in the latter part of the research program as required, funds permitting. In the next few years, there may also be significant advances in experimental techniques and equipment.

Task Group 8. Special Studies (4 Tasks)

This group includes special studies and unanticipated tasks which do not fit in other categories. Tracer studies and extrapolation from the Hyperion sludge outfall experience at 100 m depth are examples. Very near to the outfall discharge (within about 200 m) the similarity with the Hyperion discharge will be closest, and the Hyperion experience provides a valuable qualitative insight into the sedimentation of the larger particles and the resuspension and flushing process.

Task Group 9. Integration, Analysis, and Interpretation (5 Tasks)

The results of individual tasks and task groups do not stand alone, but must be woven into an overall picture to fulfill the goals of the project and summarize the results. This group of tasks includes cross-disciplinary interpretation of modelling data, comparison of model predictions with data, and revision of the research plan. Summaries and recommendations will be prepared annually to assist the regulatory agencies and Orange County Sanitation Districts in making decisions about continuation of the sludge discharge.

3.2.2. Strategy and Priorities.

The various tasks have to be done in a logical sequence, and will have different priorities at different times. After the project is approved by Congress and/or the cognizant regulatory agencies, we estimate a seven-year duration for this research program including 2 years of pre-discharge work, and 5 years after the start of discharge. Some work is now being done and will continue on an ad hoc basis pending project approval.

Estimates of cost by task group and year are given in Chapter 5 (Table 5.1). The total cost is estimated at approximately $1.5 to 2 million per year for seven years (in 1982 dollars). Not all of this expense is incremental because some activities (e.g., sludge

characterization) have to be done anyway. It is absolutely essential to emphasize that these costs are not based on actual proposals or task-by-task estimates, but represent only educated guesses to assist the funding agencies. Furthermore, as the project progresses there may be very substantial additions and/or deletions of research tasks or changes in priorities, depending on results obtained in earlier research.

CHAPTER 4

DESCRIPTION OF RESEARCH AND MONITORING PROGRAM

INTRODUCTION

The individual research tasks, presented in this chapter, are divided into nine broad categories or areas of effort as explained in Chapter 3. These are functionally related as indicated in Figure 3.1. Elements from several of these areas might be focused on specific environmental questions such as biological impacts attributable to oxygen depletion in the vicinity of the proposed discharge.

It is not possible to specify each task with the same degree of detail. Where monitoring or modeling techniques are well established, a relatively complete task description is provided. On the other hand, in a few cases we are able to specify only a research objective and suggest means for its pursuit. Research tasks which are in advance of existing experimental or analytical procedures are included only if they serve project goals and have a reasonable probability of being successfully carried out.

In arriving at these individual tasks, emphasis was placed on those areas in which discharge-related effects are more likely to be detected. During the course of the study, investigators should recommend changes in the program whenever: (1) measurements specified in the research plan offer no further utility for understanding environmental impacts or verifying model predictions; or (2) monitoring stations are found to be incorrectly located, or sampling frequency is improper.

All the individual tasks are listed in Table 4.1.

Table 4.1

List of Research Tasks

Task No.	Title	Page No.
Group 1	SURVEY FOR DISCHARGE-RELATED EFFECTS	52
1.1	Measurement of Water Quality Characteristics	52
1.2	Water Column Biological Monitoring	55
1.3	Inventory of Local Sport and Commercial Fishing Activities	55
1.4	Trawl Monitoring Program	56
1.5	Benthic Surveys	57
1.6	Age Dating and Chemical Analyses of Sediment Cores by Layers	58
1.7	Measurement of Sedimentation Rate via Sediment Trap Deployment	60
1.8	Bioaccumulation of Trace Contaminants	61

8.4	Assessment of Potential Public Health Impacts	87
Group 9	INTEGRATION, ANALYSIS AND INTERPRETATION	89
9.1	Analysis and Interpretation of Survey Data	89
9.2	Comparison of Model Predictions with Observations	90
9.3	Effects of Organic Enrichment on the Dynamics of Midwater plankton Communities	91
9.4	Revision of the Research Plan	91
9.5	Annual Summaries of Project Results, Conclusions and Recommendations	92

Task Group 1 SURVEY FOR DISCHARGE-RELATED EFFECTS

The heart of the sludge disposal experiment lies in comparison of pre- and post-discharge oceanographic survey data as an indicator of environmental impacts. In addition, baseline (pre-discharge) monitoring data will be used to develop rational environmental models, without which generalization of observations would be very difficult, and post-discharge data will permit model verification.

Some of the baseline work listed herein is already underway, chiefly due to efforts of the Southern California Coastal Water Research Project (SCCWRP). A description of the SCCWRP predischarge sampling program is provided as Appendix A. To maintain program continuity, uniform sampling and analytical techniques will be employed whenever practicable throughout the monitoring programs specified in this section. Surface waters should be examined for sludge particles, oil and grease, and coliforms. Sampling stations will be selected to ensure that survey results generated during the course of the experiment satisfy program objectives at minimum cost. Post-discharge data will include measurements within suitable control areas.

The California Cooperative Oceanic Fisheries Investigation (CalCOFI) has an extensive record of hydrographic and biological properties in southern California waters. There are plans to change the CalCOFI sampling program, increasing the frequency and intensity of measurements and reducing the number of grid points. CalCOFI monitoring and this program should be coordinated with respect to sampling times, stations, and methods of analysis. Such cooperation may assist in estimation of any sludge-related, far-field effects within the water column.

Task 1.1 Measurement of Water Quality Characteristics

Purpose: To measure receiving water quality before and after the initiation of sludge discharge. For convenience, water quality measurements are considered either "routine" or "non-routine". The former category is comprised of general parameters influencing nutrient and dissolved oxygen status of the water column (e.g., nutrients, temperature, DO, etc.). The latter consists of trace contaminant concentrations potentially influencing ecosystem and human health (e.g., selected trace elements, chlorinated hydrocarbons, etc.). Pre-discharge measurement of these parameters in the study and control areas will permit evaluation of baseline conditions and

seasonal variations in DO status, nutrient-influenced productivity, and trace-contaminant concentrations. Post-discharge water-column measurements seek to identify discharge-related impacts on DO, nutrient enrichment, and trace contaminant availability. In addition, mathematical techniques for estimating wastefield dilution and dissolved oxygen concentration rely upon data related to several receiving water quality parameters. A special measurement program will acquire data needed to verify initial dilution and water column dissolved oxygen models. (See Task 9.2.)

Because water column oxygen depletion or eutrophication may accompany marine sludge disposal, receiving water oxygen concentrations will be monitored carefully throughout the study. Although some oxygen depression may not be harmful to marine life, water column monitoring will provide a prompt warning should waters in the vicinity of the discharge threaten to become anaerobic (which is considered unlikely).

Description: Routine water-column measurements will be made quarterly over at least a two-year pre-discharge period. To the extent possible, cruises should be coordinated with those of the CalCOFI program. During periods of outfall operation, water-column parameters are to be monitored seasonally. Pre- and post-discharge measurements will provide bottom-to-surface profiles of salinity, temperature, DO, and indicators of water clarity (e.g., turbidity). Parameters to be measured in near-bottom waters, 50 meters and 100 meters above the bottom, and above and below the thermocline include dissolved organic nitrogen, particulate organic nitrogen, dissolved organic carbon, particulate organic carbon, nitrate, nitrite, total ammonia, total phosphorus, soluble reactive phosphorus, soluble reactive silica, total and fecal coliforms, and pH. Surface waters should be examined for sludge particles, oil and grease, and coliforms. Sampling stations will be selected to cover the full extent of sludge-related water quality impacts anticipated on the basis of water quality modeling results. Appropriate control stations will also be selected, although station positions cannot be recommended at this time.

Based on water quality monitoring experience in other marine disposal settings, the station grid will extend perhaps 25 km in the westerly (downcurrent) direction and 15 km eastward from the discharge point. It is anticipated that post-discharge water column stations will outnumber those in the pre-discharge monitoring grid.

Water quality data should be analyzed for evidence of intrusion of sludge constituents into local surface waters. Aerial surveys for chlorophyll among surface waters should be considered in this regard.

Non-routine measurements of selected trace metals and trace organics should be made two (2) times per year (∿March and September)

over a reduced sampling grid consisting of perhaps six stations. Samples should be taken from the depths described above.

Prevention of sampling error and post-sampling contamination will be critical in this program. Analytical techniques must be state-of-the-art to provide needed sensitivity, accuracy, and precision. An appropriate quality assurance plan will be adopted.

Samples will be taken at two sites (study area and control) in each season at prescribed water-column depths to determine the distribution of trace metals and organics between particulate and dissolved phases. These measurements will permit determination of biotic exposures, loss terms, and transport characteristics. Trace metals and organics to be considered will include at least those listed in Table 4.2. Additional measurements may be required on the basis of sludge analyses for priority pollutants and pesticides. As in other areas of the research program, elements of the water column monitoring effort may be dropped if it is evident that they are not necessary to protect marine biota or assess compliance with applicable water quality criteria.

TABLE 4.2

Trace Constituents

Group I: Trace Elements		Group II: Trace Organics
Arsenic	(As)	PCBs
Cadmium	(Cd)	t-DDT (and derivatives)
Chromium	(Cr)	BHC
Copper	(Cu)	
Iron	(Fe)	Toxaphene
Lead	(Pb)	Hexachlorobenzene
Manganese	(Mn)	Chlorinated benzenes
Mercury	(Hg)	
Nickel	(Ni)	
Silver	(Ag)	
Tin	(Sn)	
Zinc	(Zn)	

Trace contaminants listed will form the basis of routine chemical measurements in CSDOC sludge, receiving waters, and sediments. They are included by reference at numerous points in the accompanying text. Additional analyses may be required based on measurements of priority pollutant concentrations in CSDOC sludges.

Task 1.2 Water Column Biological Monitoring

Purpose: To establish levels of discharge-related impact among local communities of zooplankton and pelagic fish.

Description: Routine midwater biological monitoring will consist of zooplankton capture and hook-and-line fishing programs. Plankton will be taken at two depths -- near-bottom and 50 meters above the bottom -- at each of four stations. Zooplankton biomass will be measured routinely, individuals counted, and samples archived. In a few samples only, animals will be classified to the species level. The catch should always be examined for gross unexpected features or signs of environmental impact. Individuals will be preserved for possible subsequent trace contaminant analyses. All fish taken will be identified, counted, and measured, and stomach contents will be sampled and preserved for subsequent analyses. Pre-discharge zooplankton and hook-and-line surveys will be conducted. Post-discharge monitoring of zooplankton will be semi-annual, and the fishing program will be carried out annually.

The CalCOFI program has produced a 30-year record of zooplankton biomass at midwater depths. Spatial coherence among these data indicates that, in the absence of local perturbations, measurements of zooplankton biomass throughout California Current waters exhibit a uniform pattern of variation. That is, vast areas apparently respond to the same environmental stimuli in the absence of overwhelming local influences. The CalCOFI record may be used to advantage to illustrate the magnitude of natural variation among southern California zooplankton populations. Furthermore, CalCOFI data collected concurrent with water column biological monitoring for sludge-related effects may provide useful control information.

Task 1.3 Inventory of Local Sport and Commercial Fishing Activities

Purpose: To compare pre- and post-discharge fishing success as a measure of environmental impact. Sport and commercial fishing are obvious beneficial uses of shelf waters and must be protected. Comparison of pre- and post-discharge commercial and sport fishing success will provide a reasonable estimate of fishery impacts.

Description: Records of the California Department of Fish and Game will be examined biennially throughout the experiment for significant changes in sport fishing and commercial catches taken near the proposed sludge outfall. Observed variation will be normalized via comparison with catch figures in one or more control areas to separate

effects unrelated to sludge discharge.

Task 1.4 Trawl Monitoring Program

Purpose: To establish levels of discharge-related impacts among trawl-caught fish and invertebrates.

Description: The pre-discharge trawl program is to be a one-time effort conducted at two depths (bottom and 50 meters above the bottom -- see Appendix A, Figure A-3 for station locations). After start of discharge, trawl stations will be selected based on the probable extent of sludge-related impacts, direction of bottom contours or prevailing currents, and the positions of pre-discharge trawl stations. In light of associated expense and environmental damage, trawls should be conducted infrequently, perhaps annually, at two depths during each year of post-discharge study. Trawl-caught animals will be identified, counted, measured and weighed. Results will be analyzed to identify, if possible, any outfall-induced changes in fish and invertebrate assemblages. Gut contents of one or two indicator species will be analyzed. Trawl-caught fish will be examined for external signs of diseases such as fin rot, tumors, discoloration, etc. One or more control sites will be sampled at the same time as the discharge area to test hypotheses relative to the source of observed changes.

Levels of trace metals and chlorinated hydrocarbons (Table 4.2) will be analyzed in liver and muscle tissue of three trawl-caught species. If tissue levels prove to be uniformly low, routine monitoring for body burdens of trace contaminants will be discontinued. Liver tissue from the same species will be sectioned and examined for indications of disorder at the cellular level. Investigators will devise a set of qualitative standards based upon experience in other monitoring efforts or early results in this program for use in this regard. An effort should be made to correlate histopathological observations with tissue levels of specific trace contaminants. Tissue preparations will be photographed and photos archived as slides to permit convenient reference and comparison among sequential observations.

To the extent practicable, common trawling equipment, procedures, and analytical measures will be used throughout the program.

Task 1.5 Benthic Surveys

Purpose: To establish the intensity and extent of changes in the local benthic environment attributable to marine sludge disposal practice. Activities described under this task heading are arbitrarily limited to analyses of sediment surface samples and cores measuring physical, chemical, and biological conditions in marine sediments surrounding the outfall site. Post-discharge bottom trawls and near-bottom chemical measurements are described elsewhere (Task 1.4 and 1.1, respectively).

Description: There should be an intensive survey area around the discharge site plus an extensive line of stations along the 350 m isobath, up and down the coastline for perhaps ± 30 km or more. The stations used by SCCWRP in the initial baseline survey are shown in Appendix A, Figure A-2; to this near-outfall array, it will be necessary to add a line of far-field stations up- and down-coast.

Sediment samples will be obtained using equipment which satisfactorily preserves the order of material taken without losing the lighter sediment at the top of the sample. Physical and chemical measurements will include grain size analyses (at selected stations) and more extensive measurement of volatile solids, total organic carbon, total organic nitrogen, selected hydrocarbons, and selected trace metals per Table 4.2 (indicators of sediment organic enrichment or the presence of sludge-related contaminants). A few (e.g., three) deep cores will be extracted and stored for subsequent age-dating and analysis. The existing community of benthic macroinvertebrates will be characterized via a set of bottom sediment samples. The same set of samples will serve as the basis for chemical measurements. Parameters representative of community structure (e.g., biomass, number of species) will be generated for comparison with subsequent monitoring results.

Pre-discharge sediment redox conditions will be characterized via a one-time sampling program consisting of surface sediment (top 5 cm only) samples and analyses for indictors of sediment DO status. Prior to the introduction of sludge into the area, there is little reason to expect a significant degree of seasonal variation in these parameters, and a baseline program designed to expose natural variation of longer time scale is not feasible. Samples for redox measurements are to be taken from about 12 stations comprising a subset of baseline sediment sampling points. Stations will be sufficiently widespread to provide a broad sampling of locations and natural environmental conditions.

Throughout the discharge period, representative sets of sediment samples (at least the top 5 centimeters) will be taken from potentially impacted sediments at six-month intervals. In addition, a

one-or-two-time sampling program may be required to augment routine measurements immediately following discharge initiation, during the period when related changes in sediment quality are expected to change most rapidly. The sampling grid will overlay, to the extent practicable, the pre-discharge grid (Appendix A, Figure A-2) although the number and location of stations will be selected to reflect the full intensity and extent of predicted outfall-related effects. Sediment quality models will be consulted in the selection of stations. Because of the suspected influence of bottom topography on currents, it is anticipated that sampling points will follow bottom contours up- and downcoast from the discharge transect. A trade-off is necessary between extensive spatial mapping with few replicates versus limited spatial coverage with greater sample replication. As in the pre-discharge survey, care will be taken to preserve sediment order and avoid loss of material at the top of the core in all sediment samples. Physical and chemical tests will include, as a minimum, analyses of grain size and measurements of the sediment surface layer volatile solids, total organic carbon, total organic nitrogen, selected hydrocarbons and trace metals. Both sediment particulate material and pore water will be analyzed for trace organics and metals in order to answer remobilization questions. In addition, indicators of DO status measured in the pre-discharge program will again be monitored to characterize post-discharge redox conditions.

Benthic infauna taken in the samples will be identified, counted, and weighed. Results will be analyzed using such parametric indicators as biomass, species diversity, number of species, and other appropriate measures.

Gonadal tissue from prominent urchins taken from both impacted and control areas will be sectioned and examined microscopically for evidence of abnormality at the cellular level. Investigators will devise a qualitative scale with which to evaluate the histopathological well-being of organisms studied in this fashion. In this area, initial monitoring results will be used to devise an appropriate strategy (in terms of geographic extent, frequency, and repetition) for subsequent measurements. Efforts should be undertaken to correlate these results with measured physical and chemical sediment characteristics. Tissue preparations will be photographed and photos archived as slides to permit convenient reference and comparison among sequential observations.

Task 1.6 Age Dating and Chemical Analyses of Sediment Cores by Layers

Purpose: To compare pre- and post-discharge sediment cores as an indication of sludge particle deposition rate and fate. Bioturbation depth may also be determined from profiles of isotope concentrations.

20-955 O—84——54

A number of natural processes play potentially important roles in determining the local rate of sediment deposition and degree of stratification within a given sediment core. In addition to the numerous factors affecting sedimentation rates, bottom currents periodically achieve strengths necessary for sediment resuspension. Such events may cause a winnowing of fine or organic particles from the accumulating sediment and upset the chronology of deposits by restratifying particles in a way which favors redeposition of relatively light or fine material at the surface.

Description: Comparison of pre- and post-discharge core characteristics will permit estimation of net solids accumulation rates as a function of position relative to the discharge point. The pre-discharge cores may reveal geological markers beyond the reach of surface sediment disturbances which will prove useful as reference points. In this regard, full advantage will be taken of existing cores and results of previous sediment measurements. A sequence of analyses will shed light on the relative importance of natural processes, such as sediment resuspension, biological mixing, and contaminant mobilization in pore water, as determinants of sediment quality. Sediment quality models can be calibrated on the basis of core data and routine benthic surveys (Task 1.5). Comparison of core data with the CSDOC sludge quality records will provide the basis for mass balances and first-order estimates related to the fates of specific contaminants in the marine environment (see Table 4.2).

Appropriate age-dating techniques (e.g., Pb-210, Cs-137, C-14 concentrations) should be used to date layers in both pre- and post-discharge cores. The post-discharge coring grid will cover the full geographic extent of sludge-related impacts. Changes in sediment quality characteristics will be most apparent in the direction of the prevailing sub-thermocline current at the discharge depth. However, the foci of chemical and biological changes may gradually shift offshore due to sediment resuspension and redeposition.

Box-coring devices will be used to collect sediments for chemical analyses. During the first two years after discharge initiation, cores will be taken annually. Thereafter, a full set of samples need only be taken every three years. The overall program should include a one- or two-time core extraction following significant storms to assess the importance of isolated events as determinants of overall sediment quality characteristics. Selected cores are to be age dated, and all will be analyzed by layers for trace metals and selected hydrocarbons known to be present within the CSDOC sludge (Table 4.2). The output of the sediment analyses should include estimation of sedimentation rate, depth of mixed zone, and profiles of trace contaminant concentrations.

Layer thickness may be varied within the sediment column but should be selected to minimize the number of separate analyses without sacrificing resolution of variation in important parameters. Naturally, intervals should be smallest where the rate of change in contaminant concentration is greatest. It is also anticipated that at some point in the program, analysis of material from below the mixed zone can be discontinued since this material may be considered permanently buried (barring some catastrophic event) and subsequent analyses would provide only duplication of previous findings.

Task 1.7 Measurement of Sedimentation Rate via Sediment Trap Deployment

Purpose: To compare the sludge-related fluxes of organic and inorganic material with background sedimentation rates. Near-bottom sediment traps will provide the means for estimating gross solids accumulation rates. Similarly, trapped material provides a reasonable estimate of the upper limit of deposition rates for oxygen-demanding materials and/or potentially deleterious trace contaminants. Differences between pre- and post-discharge sediment trap data will provide the basis for estimating outfall-related sediment enrichment of these contaminants.

Sediment traps may also support development of dissolved oxygen models for receiving waters and local sediments. Traps deployed within the water column can be used to estimate natural or discharge-related fluxes of oxygen-demanding material as a function of depth.

Description: As part of the pre-discharge monitoring program, midwater sediment traps will be deployed via attachment to current meter moorings. Traps will be placed at 100-meter vertical intervals from 100 meters below the surface to the bottom. The upper traps will measure "natural" particle fluxes while the lower traps will help in determining particle resuspension rates. At each mooring, a trap will be placed in the near-bottom waters to provide an estimate of gross sedimentation rate as a function of position relative to the proposed discharge site. Although there is little reason to expect strong lateral gradients in the pre-discharge distribution of particulate flux, the post-discharge sedimentation pattern should clearly reflect the position of the outfall and local current characteristics. For this reason, the sediment trap program should be enlarged during the post-discharge monitoring period. Because current meters will be removed after local currents have been adequately characterized, deployment of post-discharge traps will require additional moorings. Sampling stations will be oriented about the discharge point to highlight effluent-related variation in sedimentation rate in directions parallel and perpendicular to local bottom contours. Trap contents collected at selected moorings will be analyzed for trace

contaminants known to be present in the CSDOC sludge (see Table 4.2).

The continuation of this task will be contingent upon a demonstration that the experimental technique is working properly for this application.

Task 1.8 Bioaccumulation of Trace Contaminants

Purpose: To measure the bioconcentration of trace contaminants (Table 4.2) in the marine food web during pre- and post-discharge periods. Although persistent chemicals represent one of the areas in which a marine sludge disposal is potentially linked to human health, mechanisms for trace contaminant accumulation in marine biota are not well understood. Bioconcentration studies to be carried out in this research are empirical in nature. They are based on measurement of pre-discharge biotic burdens and water/biota partitioning of trace contaminants, prediction of post-discharge burdens based on bioconcentration partitioning theory, and post-discharge biotic measurements to evaluate predictions and assess discharge effects. Predictions based on various discharge scenarios and post-discharge measurements should provide a clear warning if contaminant problems are to occur. The approach taken should provide a framework with which to anticipate food web impacts in other marine disposal settings.

Description: Selected species of dominant phytoplankton (surface waters only), zooplankton, benthic macroinvertebrates and commercial fish will be analyzed for specific trace contaminants present in CSDOC sludge and potentially accumulated in the food web. Historical studies should be considered in designing this program, as well as the several related measurements carried out in the SCCWRP baseline survey (Appendix A). Pre-discharge monitoring will consist of annual measurements to determine biotic burden, and will be tied to water-column analyses for selected trace contaminants (Table 4.2). In this way, bioconcentration factors and ecological magnification can be assessed. Post-discharge sampling will be conducted annually at sites in the study and control areas not yet determined. Based on a review of bioconcentration and magnification literature (including relationships between bioconcentration factor and other measures of trace organic accumulation - i.e., octanol water partition coefficient), contaminant partitioning coefficients and biotic burdens resulting from sludge discharge will be estimated. Post-discharge measurements will be used to verify projections and complete model development.

A review of the literature on bioaccumulation and existing data for the Southern California Bight, coupled with the relatively low fluxes of trace contaminants in this discharge (see Tables 2.2 and 2.3), may indicate that this task should be reduced in scope.

Task 1.9 Designation of Control Sites for Water Column and Sediment Monitoring

Purpose: To select, if possible, one or more control sites for measurement of natural fluctuations in water and sediment quality during the post-discharge period. Identification of a control site is critically important if variation in environmental conditions due to sludge disposal is to be separated from other potential sources of variation in the marine environment. Control sites should be minimally impacted by the sludge discharge and by any other source of pollutants which does not affect the study site in a similar fashion. Furthermore, the physical characteristics of the control site should be essentially identical to the pre-discharge features of the study site. That is, the control location should have similar depth and bottom characteristics (e.g., sandy, silty, etc.), dissolved oxygen profile and other water mass characteristics, prevailing current, and so forth.

Description: The pre-discharge monitoring program will include an abbreviated benthic and water column sampling effort designed to expose the general characteristics of potential control locations. Control areas will be sought primarily in the downcoast (southerly) direction. Areas sampled should be unaffected by other major sources of pollutants such as oil seeps, river or harbor discharges, or marine discharges. The abbreviated sampling program should include such parameters as sediment organic content and biomass and water column profiles of temperature, salinity, density, and dissolved oxygen concentration. Water column monitoring at the control site should be conducted at approximately the same time as the measurement of water-column characteristics at the study site.

Since selection of a true control site may prove difficult, several potential sites should be examined. In this regard, pre-discharge sediment monitoring at the far-field stations described in Task 1.5 may provide helpful data. Furthermore, a control area for water column measurements may be inappropriate as a control for benthic monitoring. Designation of control sites cannot precede at least the initial results of the post-discharge monitoring programs.

Task Group 2 SITE CHARACTERISTICS

Major portions of the pre-discharge survey described in Task Group 1 are devoted to characterization of the proposed sludge discharge site. To avoid duplication, these monitoring efforts are included here only by reference (Tasks 1.1 through 1.8). The only new work described in this section consists of the investigation of ocean currents and bottom conformation in the outfall region. If an adequate record is obtained during the pre-discharge period, additional detailed current measurements may be unnecessary because sludge discharge effects on the current structure will be negligible.

Task 2.1 Measurement of Local Currents

Purpose: To characterize the movement of water masses in the vicinity of the proposed outfall. A comprehensive current monitoring program is recommended to characterize currents in terms of intensity, persistence, and temporal and spatial variation. This information is necessary for modeling the transport and fate of discharged sludge, and interpreting post-discharge monitoring results.

Description: Stations and meter depths described subsequently may be modified by those drafting the final current monitoring program provided such changes are designed to satisfy monitoring objectives at minimum cost. An uninterrupted (so far as practicable) series of current measurements will be obtained at 3, 4, or 5 depths at each of at least four different moorings. See Figure 4.1 for approximate mooring locations. Three moorings should be deployed at the 100-meter, 350-meter, and 500-meter isobaths on a transect which intersects the proposed discharge site. A fourth string of four current meters should be placed approximately 15 km west of the proposed outfall terminus on the 350-meter isobath. Depth permitting, meters should be placed two meters above the bottom, 350-meter depth (500-meter isobath only), 200 meters, 100 meters, and near-surface (about 10 meters below the surface). The shallow (100-meter) mooring will carry only three meters -- surface, mid-depth, and bottom. Proven equipment which is generally accepted within the oceanographic community is to be utilized.

Thermistor chains should be placed on the 350-meter and 500-meter moorings in the main transect, covering the top 200 meters with thermistors at 10 to 15-meter intervals. Sediment traps should also be provided at several depths along each of the moorings (see Task 1.7 for details).

Figure 4.1 Proposed Current Meter Mooring Locations.

Half-hourly (vector) averaged data are to be collected and analyzed statistically for inferred daily excursions, displacements during periods of unidirectional flow, joint distributions of current speeds and directions, vertical isotherm movement, and such other characteristics as may clarify the circulation, advection, and density structure of the water column.

A much less extensive current meter sampling program (e.g., one or two current meters at the discharge site) should be continued throughout the discharge period to characterize long-term variations.

Task 2.2 Hydrographic Surveys for Determination of Geostrophic Currents

Purpose: To calculate the geostrophic currents in a broad region surrounding the discharge site by measurement of water column density transects. Such information will complement the current meter records and assist in estimating the direction and extent of discharge-related, far-field effects within the water column and on the bottom.

Description: The distribution of salinity, temperature, density, and such other properties as may be of interest should be measured along at least three transects perpendicular to the depth contours. Cruises are envisioned to sample water properties from the ocean surface to the bottom. At least three transects are to be located at such positions as

(1) along the proposed outfall alignment out to approximately 40 km offshore,

(2) about 30 km north i.e., approximately off Point Fermin out to the shelf on Santa Catalina Island, and

(3) about 30 km south of the outfall, i.e., approximately off Dana Point.

Each of the transects should be surveyed at least two times per year (March and September). This should be done at least once, and preferably in two successive years to indicate year-to-year variations.

An adequate number of observations should be made to resolve the horizontal and vertical structure of property distributions. The data should be presented in contoured cross-sections. Geostrophic velocities perpendicular to the transects should be calculated relative to the bottom.

In addition, measurements should also be made at several stations located at each of the basin sill areas to facilitate data interpretation.

Task 2.3 Site Bathymetry

Purpose: To establish bathymetric characteristics in the vicinity of the proposed outfall. Accurate bathymetric information is essential to the design of any submarine works. Available bottom soundings may be inaccurate and should be updated using modern survey equipment.

Description: A bathymetric survey will be carried out covering the area surrounding the proposed outfall location. The survey should encompass all the sampling sites in the monitoring effort and extend at least 20 km up- and downcoast from the discharge point and to the middle of the basin in the offshore direction. Equipment chosen will be capable of accurate determination of both depth and horizontal positioning. The survey lines may be set quite far apart initially (e.g., 0.5 km). If results check with existing charts, additional measurements will be unnecessary until design is initiated. If discrepancies are found, however, then additional lines should be surveyed to obtain the correct bathymetry.

Task Group 3 SLUDGE CHARACTERIZATION

Experiments described in this task are designed to characterize sludges from the CSDOC treatment plants in terms of selected, environmentally significant parameters; determine how sewage treatment and industrial waste pretreatment (source control) alternatives might impact those sludge characteristics; and finally, to investigate the behavior of sludge particles and associated trace contaminants when placed into marine waters. Of special interest are the settling properties of sludge particles and the fractionation of trace contaminants such as metals and pesticides between the dissolved and particulate phases. Each subtask is designed to promote a rational understanding of transport and transformation processes (see discussion, Chapter 2) which actively determine the fates of pollutants discharged to the marine environment or to provide input data for predictive water and sediment quality models described in Task Group 4. Sludge characteristics are requisite to development and application of such predictive models and to rational analysis of events observed following initiation of sludge discharge.

Task 3.1 Measurement and Projection of Sludge Quality Parameters

Purpose: To characterize CSDOC sludge mass flow and chemistry throughout the life of the experiment. Determination of discharge characteristics is the first step in estimating water quality impacts associated with marine sludge disposal. Historic sludge quality analyses carried out by CSDOC will be considered in specifying additional study. Detailed information, including estimates of central tendency and variation, should be developed for each contaminant of potential environmental or health-related import. Factors affecting sludge quantity and quality projections at Orange County include (a) industrial waste pretreatment regulations on industries tributary to the CSDOC wastewater treatment system; (b) planned growth in the Orange County service area including projected industrial growth; (c) wastewater treatment processes; and (d) sludge treatment processes (e.g., digestion, screening). Studies to evaluate (c) and (d) are proposed in Task 3.2.

Description: The results of previous CSDOC sludge quality analyses will first be collected, evaluated, and parameterized. The ongoing, routine analytical program will be scrutinized and augmented as necessary to provide a minimum data base. Whenever possible analyses are to be conducted on sludge samples receiving treatment comparable to that anticipated for sludges destined for marine disposal.

(i) Sludge volume will be measured daily for at least 12 consecutive months. Because sludge production is dependent upon the level of wastewater treatment provided, sludge volume and other measurements described subsequently are strictly valid only under operational conditions similar to those anticipated during the conduct of the sludge disposal experiment. However, when projected operational conditions cannot be created as part of the sludge characterization program, extrapolation from existing quality data will be necessary.

(ii) Sludge concentrations of total and volatile solids, important trace metals, common pesticides and synthetic organics, major anions, chemical oxygen demand, five-day biochemical oxygen demand (BOD), organic nitrogen, ammonia, and pH will be measured in 24-hour composites taken several times per week during the first three to six months of sampling. Thereafter, single 24-hour composites will be taken monthly. Measurements will be made on both particulate and dissolved fractions.

(iii) Initially, monthly grab samples of treated sludge will be analyzed for total and particulate organic carbon and for fatty acids and carbohydrates in dissolved and particulate fractions. The program will be discontinued when observed variation in these parameters is considered well characterized.

(iv) On at least three occasions prior to the initiation of sludge discharge, sludge samples will be analyzed for the complete list of priority pollutants, as designated by current EPA regulation. Analyses should be carried out in both dissolved and particulate fractions.

(v) Appropriate toxicity testing will be carried out on at least two occasions.

(vi) The effect of temperature on BOD kinetics will be investigated by monitoring oxygen demand in seawater-diluted sludge maintained at a series of temperatures ranging from minimum ambient seawater temperature at depth to 20°C. Experimental results should permit development of a functional relationship between the first-order rate constant for BOD exertion and temperature.

In projecting sludge quality characteristics at CSDOC, efforts will be made to (i) extrapolate from past trends, (ii) consider the effect of planned changes in treatment levels or operational procedures anticipated at CSDOC wastewater treatment plants, and (iii) estimate the impact of EPA industrial waste pretreatment regulations and/or industrial growth on sludge quality. Reasonable efforts will be made to identify major point sources of priority pollutants tributary to the CSDOC treatment system. The effect of specific discharge prohibitions will be estimated for pollutants felt to play a potentially critical role as determinants of marine environmental health. Despite obvious uncertainties, Orange County sludge quality

characteristics should be projected over at least a ten-year period.

Task 3.2 Evaluation of In-Plant Unit Operations Affecting Sludge Characteristics

Purpose: To develop relationships between sludge treatment processes and sludge volume and quality. A number of in-plant sludge treatment operations will be considered including anaerobic digestion, sludge screening to remove the largest particulate fraction, and skimming of quiescent sludge to remove floatables. Exclusion of specific sludge fractions from digestion (e.g., waste activated sludge) or separate disposal of particularly worrisome material (e.g., skimmings from primary clarifiers) is also possible. When practicable, full scale operations should be utilized directly for related studies. If such facilities do not exist or experiments are impractical, bench scale tests may be used to estimate attendant sludge quality improvements.

Description: The effect of anaerobic digestion on sludge characteristics will be investigated directly by comparing the qualities of digested versus undigested waste-activated sludges in full-scale operation. In at least six consecutive months, raw and digested waste activated sludges should be analyzed across a single, representative digester for total suspended solids, trace metals, pesticides, specific anions, five-day BOD, COD, organic nitrogen, and ammonia. Raw sludge samples should consist of flow-weighted, 24-hour composites of digester influent. Digested sludge samples may be flow-weighted composites over any period representative of digester pumping operations. Trace metals and pesticide concentrations will be measured in both the particulate and dissolved fractions of raw and digested sludge samples.

During at least six consecutive months, grab samples of raw and digested sludges are to be analyzed for concentrations of total organic carbon (TOC), particulate organic carbon (POC), fatty acids and carbohydrates. The effect of digestion on critical priority pollutants (those observed in high concentrations during analyses for priority pollutants, per Task 3.1) should also be investigated via analysis of raw and digested sludge grab samples.

Bench scale or pilot studies are recommended for evaluation of sludge screening and skimming benefits. Care should be taken to ensure that studies are representative of full scale capabilities in terms of screen size, period of quiescence for separation of floatables, etc. Screenings and skimmings are to be analyzed directly for total solids, trace metals, pesticides, five-day BOD, TOC, POC, fatty acids and carbohydrates.

Task results will be used in water quality models to generate a rational basis for sludge processing decisions.

Task 3.3 Measurement of Sludge Particle Size Distribution, Settling Characteristics, and Coagulation Effects

Purpose: To determine particle fall velocities in seawater for subsequent use in predictive models and interpretation of post-discharge monitoring results. Most sludge particles are heavier than seawater and will sink slowly back toward the seabed following establishment of a passive wastefield. Consequently, the rate at which waste materials accumulate among local sediments should depend upon (among other things) the settling characteristics of sludge particles following initial dilution with seawater. Since discrete settling velocity is primarily determined by the density difference between a particle and its surroundings (hard to measure) and particle size (relatively easy to measure), experiments should be constructed to determine both settling velocities and particle size distributions following seawater dilutions representative of the initial dilution process. The program should be sufficiently extensive to permit establishment of relationships between particle size distribution and settling velocity and to characterize variation in particle size distribution.

The role of coagulation as a determinant of time-dependent particle size distribution within the established wastefield is not well understood. Introduction of an essentially freshwater waste into a saline environment is expected to destablize particles by at least partially offsetting their mutual repulsion. Thus the marine environment provides circumstances favorable to particle growth and accelerated deposition. Understanding how coagulation affects particle settling will permit more rational estimation of particulate fluxes to local sediments.

Description: Bench-scale column experiments are recommended for establishment of particle settling characteristics and investigation of coagulation effects. Experiments will be run on representative dilutions of sludge samples. Techniques for such experiments have not been thoroughly worked out, and latitude must be afforded the experimenter. Technical difficulties have typically attended attempts to initiate particle settling from a single vertical position in the column, as opposed to starting the sedimentation process within a well-mixed column. Particle size distribution measurements should be conducted within the fluid mixture representing wastefield conditions immediately following completion of the initial dilution process. Because turbulent shear which accompanies sludge discharge and mixing of the initially buoyant jet is expected to enhance coagulation and

change the distribution of particle sizes in the passive wastefield, column experiments and particle size measurements will be conducted on samples subjected to rates of shear typically encountered within the initial dilution process. (For description of previous fall velocity studies of digested sludge diluted in seawater, see Faisst (1976).)

Task 3.4 Mobilization of Trace Contaminants within the Water Column

Purpose: To measure the exchanges of various trace contaminants between particulate and dissolved phases when sludge is diluted with seawater. The extent to which decomposition and desorption processes will favor the liberation of sludge-related trace contaminants in the water column is not well understood. The discharge of sludge into the marine environment represents a major discontinuity in redox conditions for particles and associated trace contaminants. The rapid shift from anoxic to oxic conditions may cause an environmentally significant change in equilibria governing the distribution of metals and potentially toxic refractory organics between the dissolved and particulate phases. Previous work indicates that higher oxidation state tends to favor the desorption of several (though not all) trace metals present among sludge particulates. The situation is complicated by the dependence of toxicity (exhibited by some metals) on oxidation state and poorly understood desorption kinetics.

Description: Experiments designed to investigate the mobilization of trace contaminants from discharged sludges will be preceded by a survey of related scientific literature. Reliable analytical results generated elsewhere will be used to limit the scope of original research undertaken within this program. Necessary chemical desorption or adsorption studies will be carried out using well characterized sludges maintained under anoxic conditions until rapidly mixed with seawater in a manner which simulates the initial dilution process. Following dilution the sludge-seawater mixture will be maintained as a well mixed aerobic solution. The distribution of trace contaminants between dissolved and particulate phases will be measured periodically to characterize the extent and time dependence of the desorption reaction (or adsorption, as appropriate). Experiments will also yield estimated degradation rates for specific synthetic organics in the marine environment.

Task Group 4 MODELING

Predictive models are useful tools for understanding processes, mechanisms, pathways, and cause-and-effect relationships in complex phenomena. They often form a basis for integration and synthesis of information from several sources or disciplines. Within the present research plan, mathematical models will be used to

(i) estimate mixing and transport of discharged sludge within receiving water,

(ii) estimate values of water quality indicators such as dissolved oxygen concentration in the water column,

(iii) predict the fallout pattern of sludge particles among local sediments, and

(iv) calculate trace contaminant concentrations and oxygen distribution in the sediment.

The baseline survey and sludge characterization studies will provide input data for model development. Since improvement in existing modeling procedures is expected to be an outgrowth of the overall program, model configurations cannot be fully anticipated at this time. Predictions will be utilized in both outfall design and selection of appropriate sludge treatment operations and industrial waste pretreatment measures.

Task 4.1 Initial Dilution and Height of Plume Rise

Purpose: To calculate the magnitude of initial dilution and height of plume rise during the first few minutes after discharge. Several good models exist for estimating dilution under specified conditions of receiving water density stratification, current strength, outfall configuration, discharge characteristics, etc. Such models also predict the equilibrium height of rise of the wastefield — the height at which the diluted sludge discharge achieves the same average density as its surroundings. Thus initial dilution models can be used to predict wastefield concentrations of sludge contaminants and locate the wastefield within the water column when initial dilution is complete. Because dilution and equilibrium height of rise depend on several variables within the control of the design engineer, these models should be run to develop a disposal strategy during preliminary outfall design. Model output will be used as initial conditions for

other water quality models.

Description: Any one of several models may be used for estimation of initial dilution and equilibrium height of rise. The sensitivity of results should be tested by varying input data (currents, receiving water density stratification, sludge flow) throughout their feasible ranges. Pre-discharge water column measurements (Task 1.1) will provide necessary input data. Care should be taken to identify and model worst case conditions.

Model results are to be combined with projected sludge characteristics to predict wastefield concentrations of specific contaminants. Wastefield concentrations so calculated will serve as the basis for predilution and industrial waste pretreatment recommendations.

Task 4.2 Estimation of Water Column Dissolved Oxygen Concentrations

Purpose: To predict changes in water column dissolved oxygen concentrations for impact assessment and comparison with post-discharge measurements. Since maintenance of receiving water dissolved oxygen levels is biologically important, development of a midwater dissolved oxygen model will receive priority within the project. A successful predictive oxygen model would be of general value for estimating water column dissolved oxygen deficits within other marine waste disposal scenarios. The effects of dissolved oxygen reductions on zooplankton respiration will be investigated separately in Task 6.2.

Description: Development of a midwater dissolved oxygen model of the following form is anticipated:

(i) Model inputs will consist of initial wastefield concentrations of dissolved oxygen and oxygen-demanding materials (outputs from the initial dilution model) in addition to ambient dissolved oxygen concentrations and temperature from predischarge monitoring.

(ii) The model should consider the kinetics of oxygen demand (including temperature effects) and dilution due to turbulent diffusion subsequent to wastefield establishment.

(iii) Model output will include minimum wastefield dissolved oxygen concentration as a function of time following initial dilution (i.e., following a patch of the passive wastefield in the Lagrangian sense). The model should also be run assuming that the discharge has no associated biochemical oxygen demand. Comparison of these cases will

permit estimation of oxygen deficit due to the exertion of waste-related oxygen demand, as opposed to plume-induced upwelling of low dissolved oxygen bottom waters.

Task 4.3 Estimation of Particulate and Trace Contaminant Fluxes to Local Sediments

Purpose: To predict the outfall-related pattern of particulate deposition in the vicinity of the proposed sludge discharge. Dissolved oxygen in bottom waters and trace contaminants in sediments depend upon deposition rates of outfall-related particulates. The flux of particulates and associated contaminants to the ocean floor is governed by processes such as sedimentation, diffusion, advection, particle dissolution and aggregation, and contaminant mobilization from particles in the water column.

A series of current measurements can be combined vectorially to simulate the position of advecting water masses as a function of time. This form of analysis is limited geographically by the proximity of current meters and spatial coherence of currents. By repeating the procedure a sufficient number of times, one can estimate the probability of finding a puff of wastewater at any position (x,y) from the discharge point, given that time t has passed since discharge of the puff. Such information can be combined with discharge characteristics, settling velocity data, effects of eddy diffusion, particle decomposition rates, and contaminant remobilization data to estimate average rates of gross particulate and trace contaminant deposition as a function of position relative to the discharge point.

Description: Current meter and settling velocity data will be used to simulate wastefield trajectories. A set of probability density functions representing the probability of sludge particles reaching the sediments at any position (x,y) from the discharge point will be developed from the wastefield trajectories. The number of potentially important phenomena which can be handled rationally within this model is not yet known and will depend upon results generated elsewhere within the sludge outfall study. The model is to consider, as a minimum, the concurrent effects of wastefield advection and particle settling. Should the data base support their mathematical treatment, ocean turbulence, coagulation, decomposition of particulate organics, and desorption of specific contaminants will be included. Model calibration will be based on sediment trap data collected as directed elsewhere in this report (see Task 1.7).

20-955 O—84——55

Task 4.4 Sediment Concentrations of Dissolved Oxygen and Sludge-Related Contaminants

Purpose: To develop modeling techniques and predict sediment and pore water concentrations of dissolved oxygen and sludge-related contaminants in the vicinity of the proposed outfall site; and to predict the areal extent of sulfide bearing sediments.

Sulfide generation results from the bacterial oxidation of organics in the absence of molecular oxygen and oxidized nitrogen forms. Oxygen depletion leads to reductions in species diversity and biomass. Only a few specialized benthic organisms persist in the presence of hydrogen sulfide. Development of a sound sediment dissolved oxygen model will also provide an important boundary condition for the water column dissolved oxygen model (see Task 4.2).

Contaminants such as trace metals and synthetic organics are possible sources of biological anomalies in the vicinities of several major marine outfalls in southern California. As such, prediction of sediment concentrations of such materials could improve pre-discharge estimates of environmental impacts in a variety of disposal settings.

Description: Factors to be considered in sediment dissolved oxygen and trace contaminant models include:

(i) the fluxes of oxygen-demanding materials (natural and outfall-related) or trace contaminants (Table 4.1) to local sediments as a function of position from the discharge point (output from Tasks 1.7 and 4.3);

(ii) rates of BOD exertion at the sediment-seawater interface (necessary in DO model only) as a function of benthic biomass, sediment organic content, and dissolved oxygen concentration at the interface (see Task 7.1);

(iii) effects of biological mixing and periodic sediment resuspension on sediment profiles of dissolved oxygen, organics, and Table 4.1 trace contaminants;

(iv) diffusion of molecular oxygen through the oxygen boundary layer and pore water near the sediment surface;

(v) chemical mobilization of trace contaminants from sediments including the effect of redox potential on mobilization; and

(vi) temperature effects.

Several of these processes have resisted rational mathematical representation in the past. Should rational dissolved oxygen models prove ineffective, it may be possible to correlate local surface oxygen deficit with the flux of outfall-related, oxygen demanding material to the sediments. Monitoring results from the City of Los Angeles' Hyperion sludge outfall and the Los Angeles County Sanitation Districts' Whites Point outfall system may be used for this purpose.

Dissolved sulfide concentrations among sediment pore waters will be predicted using a chemical equilibrium model, input data from the monitoring program (Task 1.5), and sediment quality models discussed above. Under reducing conditions, the formation of metal-sulfide precipitates can limit dissolved concentrations. Consequently, iron content will be measured within the sediment quality monitoring program.

Task 4.5 Biological Models.

Purpose: To develop methods for predicting the intensity and geographic extent of sludge-related changes among local biota. Several other important tasks are devoted to characterizing the fauna in the vicinity of the proposed discharge site and developing exposure data (receiving water or sediment concentrations of sludge contaminants) via model application or direct measurement. Task 1.8 may yield relationships between exposures and tissue concentrations of these contaminants. It remains, then, to relate estimates of waste-related exposures, body burdens of contaminants, or dissolved oxygen depression (also calculated -- see Task 4.2) to changes in population characteristics observed within the monitoring program. Models capable of predicting the severity and extent of biological anomalies attributable to a given waste disposal scenario will permit comparison of marine disposal impacts with those of other alternatives (land, air) on a more rational basis. The environmental impacts of other disposal methods should be developed via parallel studies.

Description: Development of rational, predictive biological models is encouraged although techniques cannot be suggested at this time. An effort should be made to understand the methods by which individuals and populations of organisms protect themselves against adverse environmental conditions and the limitations of those mechanisms. Previous biological models have been premised on empirical relationships between waste discharge and/or receiving water characteristics and observed biological anomalies, and additional effort along these lines is encouraged. Post-discharge monitoring should be constructed to yield such relationships.

Task Group 5 PRELIMINARY DESIGN

Characteristics of both the discharged sludge and the initial mixing process in the ocean are within the control of the design engineer. Available alternatives, both in the treatment plant and in the submarine discharge structure, will be examined in terms of their effects on sludge quality, initial mixing, and sludge behavior subsequent to discharge.

Discharge depth is of prime importance in outfall design. Based on previous modeling (Jackson, et al., 1979) the anticipated sludge discharge depth is in the 300-400 m range. At such a depth, the resultant plume will be trapped well below the surface under all oceanographic conditions, and surface water quality will be protected. At the same time, the discharge will be shallow enough to avoid oxygen exhaustion among naturally low DO waters of the deep basins.

Task 5.1 Evaluation of In-Plant Design Alternatives

Purpose: To evaluate various treatment and control processes which affect sludge quality characteristics and recommend measures appropriate to marine sludge discharge. For example, trace contaminant concentrations in sludge can be reduced through discharge prohibitions and pretreatment requirements. The sludge solids content and the concentrations of oil and grease and large solids may be manipulated by controlling materials added to the digester or sludge processing subsequent to digestion. The amount of degradable organic carbon in the discharge is functionally related to digester detention time and fraction of discharged solids which have been anaerobically digested. All of these sludge characteristics carry implications for receiving water quality. A more complete list of treatment and control measures to be evaluated is provided in Task 3.2.

Description: In this task, we will estimate sludge quantity and quality characteristics resulting from several feasible wastewater treatment and industrial waste pretreatment combinations. Planned secondary treatment facilities within the CSDOC sewerage system will be considered as well as sludge quality improvements attributable to treatment operations such as anaerobic digestion, sludge screening, skimming, etc. These evaluations will be based on experimental results generated in Task 3.2. Here we will recommend source control and in-plant treatment measures designed to produce a sludge of acceptable quality for marine disposal.

Task 5.2 Selection of Discharge Site and Submarine Pipeline Technology

Purpose: To make a final recommendation on outfall location and depth. The technology required for construction and operation of a deepwater sludge outfall has been developed over the past two decades, both through the construction of submarine oil and gas pipelines and from the operation of the Hyperion sludge outfall. This task is focused on defining engineering design criteria for the proposed discharge and selecting a suitable discharge location.

Description: The proposed discharge site will be selected after a review of available oceanographic data and model applications. Initial and subsequent dilution calculations and related modeling will be carried out to simulate plume behavior after discharge. Maintaining dissolved oxygen at acceptable levels is a key objective. Sludge flow rates and gross density will reflect a degree of predilution of sludge with wastewater effluent. Preliminary calculations will be carried out to size the outfall and determine pumping requirements. Deepwater submarine pipeline construction techniques will be reviewed to select appropriate technologies for laying pipe to the anticipated 300-400 meter depth.

Requirements of the discharge permit (to be established by regulatory agencies) will, of course, be met by a combination of in-plant processes and outfall design.

Task Group 6 BIOLOGICAL IMPACTS -- LABORATORY STUDIES

Supplementary biological studies will be used to investigate biologically-mediated pollutant transformations and biological sensitivities to pollutants. Biological experiments are divided into two groups -- those which can be carried out effectively under laboratory conditions and those which must be performed *in situ* on natural systems. Laboratory studies are proposed in this section and field studies in Task Group 7.

Sludge particle-organism interactions will start in the water column when planktonic animals and bacteria first encounter the freshly mixed sludge-seawater mixture and continue in the sediments following particle deposition. Water-column and near-bottom particles might act as food, as poisons, or simply as environmental "noise" to the plankton overwhelming chemical cues used to find food. In turn, numerous biological factors affect the fates of sludge constituents in the environment.

A brief explanation of chemical and biological determinants of contaminant form and behavior in the marine environment is provided within Chapter 2 of this report.

Task 6.1 Effect of Sludge Particles and Organics on Zooplankton Feeding

Purpose: To determine how sludge particles affect zooplankton feeding. Sludge particles could supplement the zooplankton food supply or interfere with normal feeding activity by masking chemical cues. If zooplankton ingest sludge, they could reduce the concentration of water column particles by "packaging" material in rapidly settling fecal pellets. The mechanisms could change sediment quality characteristics near the discharge. Experiments can show the importance of these interactions and provide information for sediment and water quality models.

Description: Zooplankton used in these experiments will be captured in the vicinity of the sludge plume. Animals used should include demersal zooplankton collected near the sediment/water boundary. Maintenance of these animals following capture will depend upon temperature and perhaps pressure control. Captured, acclimated zooplankton will be exposed to a range of sludge particle concentrations in the presence and in the absence of food. Disappearance of sludge particles from the water and their appearance as fecal pellets would indicate feeding on the sludge; change of regular feeding activity with increased sludge concentration would

indicate interference. Zooplankton will be observed for outward signs of physical or behavioral anomalies and analyzed for body burdens of sludge-related contaminants at the close of the experiment.

Task 6.2 Dependence of Zooplankton Respiration on Ambient O_2 Concentration

Purpose: To investigate relationships between midwater organism metabolisms and dissolved oxygen concentration. A potentially important impact of sludge disposal at 400 m is depression of relatively low ambient oxygen concentrations. Experiments designed to see if midwater organisms can adapt to a low dissolved oxygen environment are also described.

Description: As in Task 6.1, experiments depend upon the capture and acclimation of suitable zooplankton species. In all cases, relationships will be sought between oxygen concentration and rates of oxygen consumption. It may be possible to carry out a crude adaptation test using zooplankton taken from the outfall-affected region at various times following initiation of marine sludge disposal. Oxygen consumption experiments conducted on these specimens can then be compared with the results of pre-discharge experiments.

Task 6.3 Microbial Decomposition of Water Column Organics

Purpose: To measure the rate of organic decomposition as a function of bacterial biomass, temperature, dissolved oxygen, pressure, and level of organic material present. Rates of microbial decomposition and related oxygen demand will provide data for development of a water column oxygen model.

Description: Marine water samples will be taken from midwater, near the proposed discharge site, and maintained at *in situ* temperature throughout the course of the experiment. While it is recognized that maintenance of ambient pressure under lab conditions will require specialized equipment, a few such experiments should be included within a minimum program. If it becomes apparent that pressure effects are not critical to microbial respiration, high pressure tests should be discontinued. Sludge additions to a series of water samples will bracket the range of expected sludge strengths following initial dilution. Periodic measurements in all samples will include concentrations of organics, dissolved oxygen, and microbial biomass (or an acceptable substitute parameter). The rate of sludge decomposition will be calculated from these data.

Task 6.4 Sea Urchin Toxicology -- Lab Study

Purpose: To investigate the toxic response of deepwater sea urchins upon exposure to sludge constituents. The benthic community over much of the southern California slope, including the proposed discharge site, is dominated by two species of sea urchin, *Brissopsis pacifica* and *Allocentrotus fragilis*. Marine waste disposal experience in southern California indicates that sea urchins endemic to shallower waters are particularly sensitive to waste discharge, despite the fact that under some conditions sludge particles sustain urchin populations when their preferred food sources are exhausted. Toxicological studies will be designed to establish the response of dominant urchins (both adult and larval forms) to varying concentrations of sludge-related contaminants.

Description: Methods must be developed to capture and sustain viable deepwater urchins. Maintenance of *in situ* temperatures may be critical to their survival under lab conditions. Urchins will be exposed to a series of sludge/seawater dilutions of strength designed to induce both acute and chronic toxic effects. Oxygen concentration may be varied in any or all of the dilutions. Experiments should yield an estimate of the 96-hour LC_{50} as well as levels representing the onset of such pathological and behavioral effects as loose spines, eviscerated organs, reduced feeding and oxygen consumption, etc. LC_{50} determinations should be conducted on *Allocentrotus* larval and adult forms. Organisms used in chronic toxicity tests should be analyzed for body burdens of specific contaminants known to be present in sludge. These results should be used as the basis of experiments designed to test the response of the same species to specific toxicants. Urchins will be exposed over long periods to a range of concentrations of these contaminants and observed for physiological or behavioral anomalies, as above. Body burdens of trace contaminants will again be established in an effort to correlate observed effects with exposure and bioaccumulation data.

During the course of chronic toxicity tests, organisms will be removed periodically for histopathological study involving tissue (gonadal) sectioning and observation at cellular level. An effort should be made to relate such observations to the qualitative scale devised on the basis of benthic monitoring results (see Task 1.5). Investigators should try to correlate histopathological information so obtained with exposure and bioaccumulation data.

Task Group 7 BIOLOGICAL IMPACTS -- IN SITU STUDIES.

Field studies allow one to observe the effects of sludge on a community of organisms as opposed to individuals or single species. Direct *in situ* manipulation permits ecologists to study the mechanisms of ecological change.

The technology for working at 300 to 400 m depth is not totally established. Well developed systems are available for such proposed experiments as the benthic respiration measurements of Task 7.1 and baited camera observations in Task 7.3. In other experiments, however, such as the various manipulations discussed in Task 7.5, related technology is changing rapidly. Late developments include such systems as one-atmosphere dive suits. This equipment is expensive but may permit a more direct investigation of mechanisms behind sludge impacts. Decisions relative to manipulation studies that rely on the one-atmosphere dive suits or other recent technological developments should be postponed pending accumulation of monitoring results.

Task 7.1 Benthic Oxygen Consumption

Purpose: To find relationships between physical, sludge-related impacts and rate of oxygen consumption in the benthic environment. Sediment oxygen demand is an important component of the overall oxygen balance among marine bottom waters. Sludge discharge will increase the rate of sediment oxygen demand, decreasing bottom water and sediment pore water dissolved oxygen concentrations. Direct measurement of pre- and post-discharge sediment oxygen demand will improve the qualities of sediment and near-bottom dissolved oxygen models and, ultimately, improve our ability to predict biological impacts in similar waste disposal settings.

Description: The proposed program for monitoring benthic oxygen consumption will be carried out using grab respirometers equipped with oxygen probes and syringes for sample withdrawal. Benthic monitoring stations will be selected based on preliminary modeling results to cover the full range of expected impact intensities. A typical respirometer measures dissolved oxygen concentration continuously over an incubation period withdrawing samples for calibration at the beginning and end of the monitoring period. At the close of the experiment, the sampling device removes a grab sample of sediment for chemical and biological measurements and identification of species. Based on these results, correlations will be developed between such

parameters as total biomass or oxygen concentration (independent variables) and rate of oxygen consumption (dependent variable).

Task 7.2 Rates of Particle Ingestion by Macrobenthos

Purpose: To observe the effects of sludge and dissolved oxygen concentration on particle ingestion rates. Important sediment characteristics such as grain size and organic content are dependent upon rates of sediment ingestion and particle degradation by macrobenthos. Here we propose to measure particulate ingestion rates as a function of sludge and dissolved oxygen concentration. Results may be used in sediment quality or dissolved oxygen models described elsewhere in this report.

Description: Per Task 7.1, grab respirometers will be used to carry out related experiments. Here, however, dye or isotope-labelled sludge particles will be injected into the respirometer chamber. A representative period will follow for ingestion of labelled substrate, after which samples will be retrieved and the gut contents of organisms analyzed for tracer. Dissolved oxygen concentration will be measured throughout the experiment and surface concentrations of total organic carbon will be determined in sediment grabs. Measurement of total benthic biomass is also required. Although not expressly described in Task Group 6, *in situ* particle ingestion experiments described here should be supplemented with a laboratory study constructed along the same lines.

Task 7.3 Effect of Sludge Particles on the Feeding Habits of Marine Fauna -- Baited Camera Experiments

Purpose: To observe directly the effects of sludge discharge on feeding habits of marine fauna. Baited camera experiments are the *in situ* counterparts of laboratory efforts to observe sludge impacts on fish and microinvertebrate feeding and will serve the same overall purpose.

Description: A dead fish bait in the presence and absence of sludge will be used to determine scavenger feeding preferences among midwaters 50 to 100 meters above the proposed discharge depth. It has been suggested that at sufficient concentration sludge particles interfere with chemical cues upon which zooplankton and fish depend for finding food. Baited camera experiments will be designed to test that hypothesis.

Task 7.4 Field Observation of Zooplankton Feeding in the Presence of Sludge Constituents.

Purpose: To determine whether or not zooplankton are inclined to feed on sludge particles.

Description: Comparison of gut fullness and analyses of gut contents in zooplankton taken from study (proximate to the outfall) and control areas offer the most direct sources of evidence. The Hyperion sludge discharge could be studied in this regard during the pre-discharge period.

Task 7.5 Other Biological Experiments

Purpose: To be defined as needed based on the results of post-discharge monitoring.

Description: The monitoring program described in Task Group 1 of this report is designed to register unanticipated as well as anticipated impacts of marine sludge disposal. Consequently, monitoring results will, in all probability, suggest additional field or laboratory manipulations which are not warranted at this point. The class of experiments in which divers directly manipulate elements of the local benthic environment has already been noted. Due to the expense of equipment rental and because potential advantages are not well defined at present, tasks which require the use of deep water diving equipment have been at least temporarily omitted. Monitoring results may justify their reconsideration during program revisions.

Task Group 8 SPECIAL STUDIES

In a broad multidisciplinary research effort, it is expected that the research plan may have to be modified periodically as the need for new tasks becomes apparent. As such, Task Group 8 will grow during the course of the experiment. This section contains those tasks which do not fall into any other category, including:

8.1 Identification of Sludge Tracers
8.2 Remote Tracking of Wastefield
8.3 Extrapolation from Hyperion Sludge Disposal Experience
8.4 Assessment of Potential Public Health Impacts.

Additional tasks may be included within this group in future program revisions.

Task 8.1 Identification of Sludge Tracers

Purpose: To identify tracers for direct tracking of sludge plumes and positive delineation of the depositional area. Recent advances in dilution modeling have not been matched by improved field verification techniques. Field measurements are impeded by the lack of an effective tracer. An ideal tracer should:

(i) behave in the same way as the material of interest,
(ii) not be found under natural conditions,
(iii) be detectable in very low concentrations, and
(iv) be harmless to the environment.

Dyes, radioactive tracers, and other measures all fall short in terms of these criteria. Other possibilities should be investigated.

Description: A number of substances have been suggested as tracers of wastefield dispersion and particle fallout in the marine environment. The feasibility of using these and other tracers for the purposes outlined above will be examined.

(i) Relatively heavy substances found in sludge (e.g., tomato seeds, gritty contaminants) but not in unimpacted sediments have been suggested to trace the fallout pattern in the immediate vicinty of the outfall.

(ii) Sludge refractory organics detectable in low concentrations may

be used to determine the lateral and vertical limits of effluent-related suspended materials and sediment deposits. Suggested tracers which fit this description include halogenated hydrocarbons, natural hydrocarbons such as aromatic or other cyclical compounds, and coprostanol.

(iii) Similarly, the trajectories and sediment distribution of sludge particulates can be measured using isotope ratios (e.g., $^{13}C/^{12}C$, $^{15}N/^{14}N$, $^{34}S/^{32}S$). The utility of such measurements lies in differences between ratios characteristic of natural and sludge-related particulates.

(iv) Inorganic materials present at higher concentrations in sludge than in nature, e.g., trace metals, may be used to estimate the contribution of effluent particles to local sediments. The utility of trace metals in this regard has been fairly well established through wastewater monitoring. Unfortunately, metal concentrations after initial dilution are normally so close to background levels or so near detection limits that their use as tracers of dissolved contaminants is not promising.

(v) Artificial tracers may be added to the sludge discharge if they can be detected in very low concentrations. Candidates include fluorescent plastic beads a few microns in diameter. While such tracers may have the advantage of detectability, the interpretation of related data is nebulous because the sludge discharge can only be "marked" during some relatively short time interval. The site at which measurements are taken always holds a mixture of marked and unmarked sludge. Such experiments offer a qualitative indication of the area invaded by sludge particles, provided that the beads and sludge solids are transported in the same way.

Task 8.2 Remote Tracking of Wastefield

Purpose: To locate the near-field sludge plume using an acoustic device. Among detection methods, remote sensing is by far the most efficient. Acoustic tracking may provide a convenient means for locating the established wastefield. Because marine zooplankton can be detected in this manner, zooplankton avoidance or attraction to the wastefield may be monitored acoustically.

Description: The feasibility of locating the wastefield from shipboard using acoustic equipment will be investigated during water quality monitoring cruises. If successful, the technique can be used during field verification of initial dilution and water column dissolved oxygen models.

Task 8.3 Extrapolation From Hyperion Sludge Disposal Experience

Purpose: To apply oceanographic data and insight gained via monitoring efforts at the City of Los Angeles sludge discharge site in Santa Monica Bay. For years, Los Angeles has operated an outfall dedicated to the discharge of digested sewage sludge to the marine environment. The structure, known as the Hyperion sludge outfall, terminates 11 kilometers from shore near the head of the Santa Monica Canyon at 100 m depth. Keeping in perspective the similarities and differences between the Hyperion sludge outfall and the proposed deep water outfall for Orange County, it is natural to extrapolate from the Hyperion experience to the present situation.

Description: A number of field surveys and evaluation studies have been conducted on the impact of the Hyperion sludge outfall (SCCWRP, 1974 through 1978; Bascom, 1981; Koh, et al., 1977). These data and all relevant publications will be reviewed to extract information which can be applied to the Orange County situation. Hyperion sludge is discharged in shallower water with greater potential for transport and mixing in waters of higher dissolved oxygen concentrations. Consequently, Hyperion field survey results should not be applied within the context of the Orange County study without considering these and other differences (e.g., current patterns). Los Angeles monitoring experience will permit rough projection of impact magnitudes at the Orange County site.

Task 8.4 Assessment of Potential Public Health Impacts

Purpose: To insure that no significant public health impacts result from sludge disposal practice. The primary avenues for potential discharge-related impacts to human health involve either direct contact of humans with waste and associated pathogens or ingestion of contaminated seafood from an impacted area.

Description: There is reason to expect, largely based on marine wastewater disposal experience, that detrimental effects related to direct human exposure to pathogens will not result from deepwater sludge disposal. The flux of pathogens to the environment (total number of organisms) due to sludge disposal will be significantly lower than that which results from wastewater disposal. The proposed sludge outfall is about five times deeper than the existing CSDOC wastewater outfall and will terminate farther from beaches and shellfishing areas. It is anticipated that the sludge plume will be trapped well below the ocean surface for long periods of time -- considerably longer than is necessary for destruction of enteric microorganisms. A modest program of water column coliform sampling

will be carried out to confirm that hypothesis (see Task 1.1). In the event sludge-related coliforms are found to persist among receiving waters, the program can then be expanded to include sampling over a broader area and measurement of pathogen concentrations. Consideration will also be given to potential pathogens such as pathogenic amoebae.

The potential for human exposure to toxicants of sludge origin will be assessed using monitoring and bioconcentration data developed in Tasks 1.5 and 1.8, respectively. That program should be expanded to include periodic measurements of liver and muscle concentrations of Table 4.2 contaminants among species known to be taken (commercially or for sport) from potentially impacted areas. Annual sampling frequency is recommended. Results can be compared with FDA limits for edible tissue, state standards, EPA guidelines, etc., in light of commercial and sport fishing catch statistics to determine the significance of related impacts on human health.

Task Group 9 INTEGRATION, ANALYSIS AND INTERPRETATION

As explained in Chapter 3, the research tasks fit into a conceptual structure designed to develop information on important coastal oceanographic processes and effects of the proposed deep-water sludge discharge. Task Groups 1 through 8 above will produce a wealth of related information. The purpose of this ninth group of tasks is to integrate the new knowledge within the existing scientific framework, draw conclusions, make recommendations, and revise the study plan based on the research results. Group 9 include the following individual tasks:

Task 9.1 Analysis and interpretation of survey data
Task 9.2 Comparison of model predictions with observations
Task 9.3 Effects of organic enrichment on the dynamics of midwater plankton communities
Task 9.4 Revision of research plan
Task 9.5 Annual summaries of project results, conclusions and recommendations.

Task 9.1 Analysis and Interpretation of Survey Data

Purpose: To correlate data from various tasks and develop an overall understanding of the interplay among physical, chemical, and biological processes important to the transport, fates, and effects of the sludge contaminants. Although investigators will be encouraged to interpret the results of individual tasks, integration of their findings is an indispensable function without which the overall study objectives cannot be satisfied.

Both individual investigators and those groups or individuals responsible for synthesis and interpretation of project results are to review related scientific findings generated outside the CSDOC research project to avoid duplication of effort, assist in formulation of hypotheses and experimental techniques, and interpret new information within the most relevant and complete framework possible.

Description: Accumulated data will be integrated into a suitable data bank and library collection for archival purposes, available to all investigators for work on their respective tasks. However, in this task the investigator(s) should expressly search for causal relations between observed effects and characteristics of the sources and the ocean. For example, is the observed depositional zone (or

"footprint") consistent with current measurements and particle fall velocities? Or, is the lack of detectability of some trace contaminants due to unexpected sinks, or are the dilution and dispersion so great that the expected concentrations are below the measurement thresholds?

Mass balances will play an important role in the synthesis of program results. Can we develop overall scenarios of how and where the BOD of the sludge particles is exerted? What fraction of the organic carbon in the particles is oxidized before the particles reach the bottom? Does the integral of the areal distribution of carbon deposits match the input minus losses within the water column? What fraction of discharged metals is trapped in the sediments compared to that which is flushed out of the area?

These questions are intended to be suggestive, as the most pertinent issues for study should not be predetermined. Part of the interpretation of the post-discharge monitoring data will entail identifying measurements or sampling stations which may be discontinued and, conversely, defining areas in which the research effort can be profitably expanded.

Task 9.2 Comparison of Model Predictions with Observations

Purpose: To verify predictive models using observations of dilution, transport, fates and effects of the sludge discharge. The future success and acceptance of marine discharge of any waste depends on good predictive models, so that engineered disposal systems may be undertaken with reasonable understanding of what the environmental impacts will be. This task will provide model calibration and opportunities for further model development in an effort to reach that goal. The results will thus have national significance for future waste disposal policy.

Description: Mathematical models developed in Task Group 4 will be evaluated both step-by-step and in terms of their overall accuracy. Input data will be adjusted in light of new research results, and models rerun as needed. If predicted results still disagree with observations, some parametric studies may be undertaken to see what input values yield better predictions. For example, it may not be possible to get a proper laboratory evaluation of particle fall velocities including the effects of shear-induced coagulation. Under these circumstances, it may still be possible to back-calculate the settling velocity using the sedimentation model described in Task 4.4 and sediment trap data obtained per Task 1.7.

20-955 O—84——56

Overall, this may be a large task, and may illustrate the need for modifications or additions in other tasks in order to achieve a predictive capability which is adequate for engineering purposes.

Task 9.3 Effects of Organic Enrichment on the Dynamics of Midwater Plankton Communities

Purpose: To assess carbon balance impacts among local receiving waters attributable to the discharge of sludge. The effect of sludge-related organic carbon on midwater zooplankton community ecology should be investigated quantitatively (to the extent feasible) in light of both (1) the scale of the carbon source represented by the proposed discharge and (2) the scarcity of existing data relevant to waste-related impacts among marine zooplankton. Disruption or alteration in the flow of carbon within the plankton community may be one of the primary effects of sludge (nutrient) enrichment in the pelagic ecosystem.

Description: Results of several related tasks described elsewhere will be integrated to yield a carbon budget within the potentially impacted zooplankton community. Analytical and/or experimental work to be considered in devising such a budget includes results of the following tasks:

Task 1.1 -- Measurement of water quality characteristics (dissolved organic carbon, particulate organic carbon, nutrients, etc.).

Task 1.2 -- Water column biological monitoring (changes in the distribution and abundance of zooplankton in relation to the presence of sludge-related materials within the water column).

Task 6.1 -- Effect of sludge particles and organics on zooplankton feeding (laboratory measurement of carbon utilization by zooplankton in the presence of sludge particles).

Task 6.3 -- Microbial decomposition of water-column organics (laboratory measurement of microbial organic carbon decomposition in the presence of varying sludge particle concentrations).

Task 7.4 -- Field observation of zooplankton feeding in the presence of sludge constituents.

Task 9.4 Revision of the Research Plan

Purpose: To revise the research plan annually (approximately) accounting for new scientific information, changing needs and priorities, and availability of funds.

Description: The research plan must be sufficiently flexible to respond to changing circumstances -- i.e., to permit "mid-course corrections". Examples of situations which will necessitate adjustments include:

1. Changes in water quality regulations governing this proposed sludge discharge;

2. New scientific discoveries elsewhere;

3. Unexpected research results ("surprises") which need more investigation;

4. Evidence that environmental effects are geographically restricted to the near-field and undetectable in the far-field;

5. Changing research priorities and availability of funds;

6. Changes in sludge quality or volume due to source control (or pre-treatment) and unit processes in contributing treatment plants;

7. Research results which indicate that further work on a particular task is not needed or, conversely, that program expansion is required.

Because of all these factors, a group or committee should be formed which is responsible for plan review at about one-year intervals.

Task 9.5 Annual Summaries of Project Results, Conclusions and Recommendations

Purpose: To summarize, draw conclusions, and make recommendations annually and at the end of the research project.

Description: For policy-makers this is perhaps the most important task in the research progam. It should produce a consensus (or range of views) within the scientific community regarding what was learned and what the implications are for continued sludge discharge by Orange County Sanitation Districts, or for national policy.

CHAPTER 5

PROJECT ORGANIZATION

5.1 INTRODUCTION

In this chapter we turn our attention to management questions: who does the work, how much will it cost, who provides funds, how is it managed, and how are the results evaluated? At this stage, we can only recommend some general principles for management and provide some rough cost estimates.

The research plan in Chapter 4 describes the work to be done, without regard to who will perform which tasks. Although major parts of the proposed work may be done under grants and contracts to universities and private firms, significant portions will be performed by the County Sanitation Districts of Orange County (in-house) and by the Southern California Coastal Water Research Project. NOAA, EPA, and the California Water Resources Control Board may also have some direct roles in conducting the research as well as funding it. There obviously needs to be strong coordination, while still encouraging innovative research.

Fina ly, there must be procedures for reporting the conclusions and recommendations to the regulatory agencies and CSDOC on a regular basis, so that decisions can be made regarding continuation of the ocean discharge of sludge.

5.2 RESEARCH ADMINISTRATION

The suggested organization for research administration, which is summarized in Figure 5.1, will be separate from CSDOC and its normal operating functions. Except for in-house work by CSDOC, all the research tasks should be funded through a joint administrative agreement of the various funding agencies. An administrative board representing the sponsoring agencies would appoint a well qualified scientist or engineer to be the project research administrator. This person should have experience in both oceanographic research and waste disposal problems. Using funds provided by the sponsoring agencies as a single pool, the project research administrator would carry out the research plan by means of grants and contracts and disseminate the results. The research administrator might be a career scientist drawn from one of the sponsoring agencies (such as NOAA or EPA), but while on his assignment, he would be responsible only to the administrative board. He would also operate independently of the Orange County Sanitation Districts, but maintain close technical liaison.

A research review committee of scientists and engineers would be appointed by the research administrator with concurrence of the

Figure 5.1 Suggested organization for research administration. Arrows indicate main lines of responsibility, but do not show all the communication links needed for coordination and utilization of results.

administrative board. Membership of this committee would be based on professional qualifications, rather than organizational affiliation or geographical location. The functions of this research committee, in collaboration with the research administrator, would be to:

(1) Approve the research plan and all revisions;
(2) Establish priorities among research tasks;
(3) Approve procedures for solicitation of proposals and award of grants and contracts;
(4) Evaluate research proposals submitted by organizations who wish to perform the work, and recommend awards;
(5) Prepare an annual summary of the findings and evaluate their significance.

The procedures for receiving and processing proposals (function (3) above) should vary depending on the type of task and the type of investigator. For some work, unsolicited grant proposals should be accepted, while for others well-defined requests for proposals (RFPs) may be issued. The award of research funds may be by grant, contract, or cooperative agreement, depending on which is most appropriate to the circumstances. With grants, the individual investigators are given the maximum discretion and encouragement to generate new ideas, while contracts imply a more closely prescribed and pre-determined scope of work. In short, the award mechanisms should be flexible and should not be constrained to just one procedure.

When processing proposals (function (4) above), the administrator and the research review committee will be assisted by a system of external peer review of proposals by individual experts. For renewal of grants or contracts, peer review would include evaluation of the proposer's performance under previous agreements for the sludge disposal experiment.

Investigators would be required to submit progress reports at least annually to the research administrator and a final report at the end of the research agreement. The technical components of these reports should be available to all researchers and the public. Publication in peer-reviewed professional journals ("open literature") should be encouraged and should be considered in evaluations by the research review committee.

The research administrator will also make proper arrangements to see that the basic data and research results are properly archived for easy retrieval. Updating the research plan and preparing annual summaries (part of functions (1) and (5) above) have been included in the list of research tasks (Tasks 9.4 and 9.5, respectively, in Chapter 4). The research administrator may decide to award a grant or contract for these activities in order to provide inputs for action by the research review committee.

The most important purpose of this research project is to provide information and guidance to decision-makers in the regulatory agencies and CSDOC. They will need to review the project results during the five-year post-discharge observational period and at the end of the research program to decide whether or not the sludge discharge should be continued. Factors involved in these decisions go beyond the scientific evaluation of the effects of ocean discharge, and involve impacts and costs of alternative sludge disposal systems, legal constraints, and political perceptions. Thus, while the research review committee has the major responsibility for evaluating environmental impacts, it is clearly not the proper group to be charged with the final decision on continuance of the discharge of sludge to the deep ocean.

5.3 RESEARCH PROJECT COSTS

Although cost estimation is difficult and risky at this stage, it is necessary to give some indication of the scale of proposed work. For this purpose, we established a time line originating at the date of approval of this project concept (by legislative and/or administrative actions). This date is, of course, very uncertain (or it may never occur), but it is the logical reference point for both construction and research activities. For construction of the outfall and associated in-plant facilities for sludge processing and pumping by the County Sanitation Districts of Orange County, the following schedule is anticipated:

Year	Month	Activity
0	0	Project concept approval
0	1	Site selection, start design
0	3	Filing of permit application
1	0	Complete outfall design
1	4	Complete design of on-shore facilities
1	4	Permit granted by regulatory agencies
1	4	Advertise construction projects for bids
1	7	Award construction contracts
2	4	Complete all construction, start testing facilities
2	6	Start regular continuous discharge

Thus, it is expected to take 2 1/2 years from project concept approval to start of discharge. During this period, the research project would be formally started, and two years of predischarge work would be conducted. After discharge, five years of observation are planned, making a total of seven years for the research project.

The estimated costs for each of these years ranges from about $1.5 to 2.0 million (in 1982 dollars). In Table 5.1 we show the estimated annual amounts and the percentage allocation of funds to the nine task groups described in Chapter 4. An allowance of 13 percent of the total has been included for administrative costs (equivalent to 15 percent of total direct costs of Tasks 1 through 9). No attempt has been made to further disaggregate costs to the level of individual tasks within the groups.

The final allocation of funds will of course be the responsibility of the project research administrator and the research review committee when the time comes. The present estimates are given only to illustrate how the priorities and areas of emphasis shift over the course of the project.

Before the deep-ocean sludge discharge concept is approved (before time zero), there is still need for considerable activity in Tasks 1,2,3,4, and 5 in order to acquire oceanographic data and do the analyses required to support the concept development and permit application. Such work is already under way with limited funding from CSDOC and NOAA and includes: a one-year baseline oceanographic survey by SCCWRP (see Appendix A); chemical characterization of sludge (in-house by CSDOC); measurement of sludge particle fall velocities by EQL, Caltech; and this research planning study, also by EQL, Caltech. Because of the indefinite length of this pre-approval period and the uncertainty of near-term funding arrangements, we have not attempted to include this work in the cost estimates. Some interim administrative arrangements will also be required, which we have not attempted to define.

The estimates in Table 5.1 are subject to substantial uncertainty. Furthermore, cost figures will change depending on how the project progresses and what the early research results are. The costs assume a rather thorough investigation, even though some members of the Research Planning Committee believe the effects of the sludge discharge will be minimal. The objectives, however, reach beyond CSDOC's immediate needs, to include improvements in predictive modeling of deep-water disposal and contributions of useful information for state and federal policy-makers. Because of the national objectives involved, we expect that funding responsibilities will be shared by federal agencies (NOAA, EPA), the California Water Resources Control Board, and the County Sanitation Districts of Orange County.

Table 5.1

Estimated Cost of Research Project

	Predischarge		Post-discharge				
Year	1	2	3	4	5	6	7
Estimated total cost (millions of 1982 dollars)	$2.0	2.0	1.5	1.5	1.8	1.9	1.9

APPENDIX A

DESCRIPTION OF THE SCCWRP PREDISCHARGE OCEANOGRAPHIC SURVEY

Introduction

The Southern California Coastal Water Research Project (SCCWRP) was organized in 1969 to study the environmental effects of municipal wastewater disposal in southern California marine waters. Its efforts are currently funded jointly by several major southern California wastewater treatment agencies, including the County Sanitation Districts of Orange County (CSDOC).

This appendix describes the scope of preliminary deep-ocean monitoring undertaken by SCCWRP in support of the Orange County proposal for a deep-ocean sludge disposal experiment. This work represents a first step toward establishment of baseline conditions in waters and sediments likely to be affected by the sludge discharge. The SCCWRP program, financed by CSDOC, is now in progress; results will be reported separately by SCCWRP in early 1983. When complete, SCCWRP measurements will provide: (i) a basis for estimating environmental impacts attributable to the proposed sludge discharge, and (ii) data which partially satisfy baseline oceanographic survey requirements outlined in Chapter 4. In order to avoid costly repetition, SCCWRP results, station selection, etc., should be carefully considered before proceeding with the project baseline survey (see Task Group 1, Chapter 4).

The zone under study within the SCCWRP investigation extends to a depth of >600 meters and some 20 km alongshore from the suggested discharge site. The program is designed to provide three kinds of information:

1. Physical measurements of receiving water density structure and currents. (Table A-1)

2. Chemical measurements in receiving waters, surface sediments, and some animal tissues. (Table A-2)

3. Biological measurements within the benthic and pelagic communities. (Table A-3)

The SCCWRP oceanographic survey, including sampling points and frequencies, is described in the text, tables, and figures which follow. The reader is referred to the forthcoming SCCWRP survey report for details relative to sampling procedures and equipment.

Table A-1. Physical Studies by SCCWRP

Type	Technique	Number of Sampling Periods (duration if cont.)	Number of Stations	Comments
Currents	current meters	continuous for 1 year	1	Three depths (1, 51, 101 m above bottom) read every 15-30 minutes
	"	60 days	1	51 m above bottom
	"	60 days	1	101 m above bottom
Density structure	Literature			Review profiles for years 1952-1969
	STD recorder	3	4	continuous surface to bottom
	thermography	60 days (continuous) in each of 3 seasons	1	at three depths (with continuous current meters)
Sediment grain size analyses	Pipet and sieve	1	8	Stations sampled comprise a subset of the sediment stations along a transect across the discharge site.

Table A-2. Chemical Studies by SCCWRP

Sample type	Number of Sampling Periods	Number of Stations	No. samples & depths	Analyses to be done
Sediment grabs	1	49	Subsamples from grab of upper 2 cm	archives wet - Volatile Solids, BOD, HEMs, TOC, TON organic - chlorinated hydrocarbons metals - Ag, Cu, Cd, Cr, Pb, Zn, Ni, Hg
Sediment Core	1	3	1	Archives
Water column dissolved oxygen	3	4	~50 m intervals	
Animal tissue	1	8	2 to 4 species from trawls	5 composites each of liver and muscle for metals and chlorinated hydrocarbons

Note: Sediment analyses indicated were performed on samples obtained at subsets of the 49 (total) grab sampling stations.

Table A-3. Biological Studies by SCCWRP

Animals	Technique	Number of Sampling Periods	Number of Stations	Work to be performed
Bacteria	Bottom Samples	1	8	Counts; ATP/biomass
Plankton	Auriga and Bongo nets	1	4 4 stations 2 depths	Zoo and ichthyoplankton to be identified and enumerated. (near bottom and 50 m above bottom)
Benthic infauna	Grabs	2	49/8	Identify, count, weigh benthic animals
Benthic epifauna (fish and inverts)	Otter trawl	2	8	Identify, count, weigh trawl-caught animals
Demersal fish and inverts	Photographic survey	1	3	Identify animals seen in photos
Fish	Long line	1	4	Identify, count, weigh, preserve stomachs
Food webs	Gut analyses of trawl and grab-caught animals	none specified		

Physical Oceanography

The program objective in this area is to characterize currents and water-column density structure in the vicinity of the proposed outfall. These data will permit prediction of initial dilution, plume height-of-rise, pattern of local particulate sedimentation, and the rate of exchange of water overlying the outfall-influenced sediments.

Current meters have been deployed at several elevations above the bottom at each of three stations (see Figure A-1). A string of meters is to record currents in the vicinity of the proposed discharge site (300-meter depth) continuously for about a year at 1, 51, and 101 meters above the bottom. Meters are to be deployed at two other sites to establish the continuity of currents. The first of these "secondary" stations is located 10 km upcoast from the proposed outfall, and the second is displaced in the offshore direction. To date, the current-meter program has been hindered by equipment loss. As a result, program results may represent somewhat different periods than originally envisioned.

Information on the density structure of the ocean in the vicinity of the outfall will be obtained from three sources: (1) historical data, (2) profiles measured using an STD (salinity/temperature/depth) recorder, and (3) temperature fluctuations recorded at three different elevations.

Water column salinity and temperature data obtained within the CalCOFI program will be used to provide a long-term history of the density profiles. The history includes: (1) the variability between stations; (2) seasonal variability, and (3) the inter-annual variability.

Density profiles at the proposed discharge site, as well as inshore, offshore, and in San Gabriel Canyon will be collected once during each of three oceanographic seasons. These profiles will be obtained using a recording STD. Water samples at the surface and at the bottom of the profile will also be collected to verify the STD calibration.

Surface sediments will be analyzed for grain size distribution at eight stations. Sampling points comprise a subset of the sediment monitoring stations which lie along the transect across the discharge site.

Figure A-2 SCCWRP Discharge Baseline Survey -- Location of benthic grab stations. Note, positions shown are approximate; LORAN C coordinates are available from SCCWRP.

Figure A-3 SCCWRP Predischarge Baseline Survey -- Location of stations serving trawl, plankton, and long-line monitoring programs. Note, positions shown are approximate; LORAN C coordinates are available from SCCWRP.

Chemical Measurements

Sediment concentrations of specific nutrients, metals, chlorinated hydrocarbons and petroleum hydrocarbons will be measured at some of the 49 stations (see Figure A-2) in the region surrounding the suggested discharge site. These will establish background chemical conditions likely to be affected by the proposed discharge. A replicate subsample from each station will be frozen and archived by CSDOC to permit subsequent (post-discharge) analyses for constituents which may have been overlooked initially. Three sediment cores (about 50 to 100 cm deep) will also be taken and archived.

Dissolved oxygen will be profiled to characterize predischarge receiving-water concentrations. Samples will be taken at four stations (approximately 50-meter vertical interval) during each of three seasons.

Liver and muscle tissue concentrations of metals, organic mercury, and chlorinated hydrocarbons will be measured in several trawl-caught animal species. Analyses will be carried out on composites of 5 animals (if possible) to establish baseline tissue levels for these contaminants.

Table A-2 is a summary of chemical measurements to be carried out within the SCCWRP predischarge survey.

Biological Studies

Biological surveys will be used to establish the kind and number of organisms inhabiting the slope area at depths which may be affected by the proposed sludge outfall (200 to 600 meters depth). Identification and characterization of indigenous species in this zone may permit anticipation of ecological impacts attributable to the proposed discharge.

Zooplankton and larval fishes will be collected at each of eight stations (see Figure A-3) using an opening/closing bongo or auriga net towed for five minutes near the bottom and 50 meters above the bottom. Resultant data will be used to determine the biomass and community composition of zoo- and ichthyoplankton populations in deep water.

The benthic invertebrate community will be studied via a program of bottom samples to be collected at the 49 sites specified in Figure A-2. A Van Veen grab sampler will be employed. Animals retained on a 1.0 mm screen will be identified and counted. Total biomass and Infaunal Trophic Index will be calculated and plotted as extensions of existing survey results.

Epibenthic invertebrates will be taken in bottom (otter) trawls conducted using standard procedures (8-meter net width, 1.1 m/sec speed of advance for 10 minutes) and results compared with data collected in shallower water.

Fishes may be impacted by community changes at lower trophic levels. The objectives of the SCCWRP fish study will be to (1) add to existing data on the diversity and abundance of fishes in the San Pedro Basin region and (2) study the feeding habits of several species collected. Fish abundance will be measured via several methods. Otter trawls will be conducted at the stations shown in Figure A-3. In addition, a photographic survey of the bottom and long-line collections will be made at three and four stations, respectively.

Acknowledgment

We are grateful to SCCWRP personnel for providing information on which Appendix A is based. In particular, we thank Willard Bascom (SCCWRP Director), Bruce Thompson, and Terry Hendricks for their assistance.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. ROE. Just two quick questions.

One is the quantitative amount of sludge involved. Do you know that?

Mr. HOLT. I would ask Mr. Sylvester to respond to that.

Mr. SYLVESTER. It would amount to about 150 dry tons per day.

Mr. ROE. What do you mean on page 2 of your testimony, about the middle of the page, "One option we have explored with considerable interest is that using a pipeline to take a preconditioned, non-toxic sludge—" what do you mean by "preconditioned"?

Mr. HOLT. Chairman Roe, the word "preconditioned" has yet to be defined and possibly Dr. Segar could explain just what course we are taking to define that.

Dr. SEGAR. One of the principal questions to be answered if sludge disposal is going to take place in the ocean is, just what is the appropriate treatment to be applied to the sludge to minimize any environmental effects that may be caused by that disposal of sludge.

One of the primary features of the research program is the ability to change the conditioning of the sludge before it is discharged into the ocean. Now, for example, Congressman, I might point out that an aerobic digestion of the sludge completely changes the fundamental characteristics and therefore the extent to which the material would remain on the bottom after discharge from the pipeline.

Within the research program that was designed there is the capability built into it and the intention built into it to look at the discharge of different types of preconditioned sludge in the real world ocean environment. But prior to that time there will be laboratory studies of different types of sludge with different conditioning processes to try to assess what would be the appropriate preconditioning mechanisms before ocean disposal.

Mr. ROE. You are speaking of sludge emanating after secondary treatment?

Dr. SEGAR. That is right.

Mr. ROE. Primary, secondary, and then what to do with the sludge.

Dr. SEGAR. Right.

Mr. ROE. There are no other questions. Thank you for your testimony and we will give your testimony the deepest consideration.

Mr. HOLT. We appreciate the opportunity to appear before you, Mr. Chairman.

Mr. ROE. Thank you.

Our next witness, chief engineer, Mr. Charles Button of the Boston Water and Sewer Commission.

Mr. Button, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF CHARLES BUTTON, BOSTON WATER AND SEWER COMMISSION

Good afternoon Mr. Chairman and members. Thank you for allowing me to speak before you today. My name is Charles Button and I am the Chief Engineer of the Boston Water and Sewer Commission, the agency which is responsible for providing water, sewerage, and drainage services for Boston. I am here to urge the extensions

of the Clean Water Act to allow agenices such ours to continue working to improve our sewerage systems and thereby the resultant improvement in our nation's waters.

Continued federal funding of the Construction Grants Program, as authorized in the Clean Water Act, is urgently needed by the Boston Water and Sewer Commission to continue and complete construction for major wastewater projects.

For several years the Commission has funded, on its own, a program to control discharge into Boston Harbor by cleaning, repairing and maintaining the tidegates and regulators. Presently a study is underway to evaluate alternative tidegate and regulator devices, which is expected to result in a $5,000,000--$10,000,000 construction program to minimize discharges to the Harbor and inflow into the sewer system.

Among the most critical projects in terms of water pollution control, scheduled for construction in 1983 and 1984, are three new interceptors designed to replace overloaded and obsolete sewers servicing downtown Boston, the waterfront, South End, and South Boston. The estimated cost of these construction projects is $22,500,000. These are projects which cannot go forward without help from the Construction Grant Program. In late 1984, the Commission will be ready to start construction of the final portion (Contract 4B) of the interceptor project at an estimated cost of $35,500,000 providing federal funds are available.

Continued sewer work in the South End is scheduled to take place in 1984 at an estimated cost of $18,700,000. Completion of the program in future years is expected to cost an additional $16,500,000.

The Commission is now half way through the preparation of a comprehensive facilities plan for the improvement of its wastewater system. This study has already demonstrated the need to conduct a Sewer System Evaluation Survey in parts of Roslindale, Hyde Park and West Roxbury at an estimated cost of $959,000. When the Facilities Plan is completed in 1984, it is expected to include a program of major system rehabilitation, construction of new sewers and reconstruction of a large pumping station, which we expect will require construction in excess of $25,000,000.

In Boston alone there are many projects underway or ready to start which would be jeopardized in the Clean Water Act were not extended and eligibility kept for sewers, combined sewer overflows, rehabilitation and inflow/infilitration correction. The levels of expenditure required are beyond the capacity of our Commission. We are not alone among major urban areas of our country in this regard.

I sincerely urge you to approve extension of the Clean Water Act and approve funding at the levels of $4 billion, $4.5 billion, and $5 billion through fiscal year 1988.

Thank you.

Mr. ROE. Please proceed.

TESTIMONY OF CHARLES BUTTON, CHIEF ENGINEER, BOSTON WATER AND SEWER COMMISSION

Mr. BUTTON. Thank you, Mr. Chairman.

Mr. ROE. I welcome you, Mr. Button, and I would like to defer to the distinguished gentleman from Massachusetts, Mr. Donnelly, to offer a formal welcome from our committee.

Mr. DONNELLY. Let me join the chairman of the committee in welcoming you here, Charlie. In behalf of myself and my staff, I appreciate the input you have had as we have gone through, and will be going through this process and other legislation that deals with water and sewer here in the Congress during this session.

Thank you, Mr. Chairman.

Mr. ROE. Thank you, Mr. Donnelly.

Go ahead, Mr. Button, you have the floor.

Mr. BUTTON. Thank you, Mr. Chairman.

Good afternoon, Mr. Chairman and members. I thank you very much for allowing me to speak here today.

I am Charles Button, and I am chief engineer with the Boston Water and Sewer Commission. That is the agency responsible for

provision of water service and sewer service and drainage within the city of Boston.

I am here to urge for extension of the Clean Water act to allow agencies such as ours to continue working to improve our sewer systems with the resulting improvement that comes to our Nation's waters.

I believe continuing full Federal funding of the construction grants program as authorized in the Clean Water Act is urgently needed by the Boston Water and Sewer Commission to continue and complete construction of major waste water projects.

For several years the commission has funded on its own a program to control discharges into Boston Harbor by cleaning, repairing and maintaining tide gates and regulators. Presently, a research project is under way to evaluate alternative tide gate regulators which we expect will result in construction in the area of $5 to $10 million to minimize discharges to the harbor and inflow into the sewer system.

Among the most critical projects in terms of water pollution control scheduled for construction in 1983 and 1984 are three new interceptors designed to replace overloaded and obsolete sewer systems serving the downtown area, the waterfront, the south end and south Boston. These are projects which cannot go forward without help from the construction grants program.

Continued work in the south end is scheduled to take place in 1984 at an estimated cost of $18 million. Completion of the program in future years in the area is antcipated to cost another $16.5 million.

Our commission is now halfway through a comprehensive facilities plan for the improvement of its waste water system. The study has already demonstrated the need to conduct sewer system evaluation surveys in many areas of the city. We estimate that to cost $959,000. When the facilities plan is completed in 1984, it is expected to include a program of major system rehabilitation, construction of new source, and reconstruction of a large pumping station which we will disconnect will require construction in excess of $25 million.

In Boston alone there are many projects under way or ready to start which would be jeopardized if the Clean Water Act were not extended, and eligibility kept for sewer systems, combined sewer overflows, rehabilitation, and an emphasis on inflow infiltration correction. The levels of expenditure required are beyond the capacity of our commission.

We are not alone among major urban areas of our country in this regard.

With that, I do very sincerely thank you for the opportunity to speak and I urge extension of the Clean Water Act and funding at the levels of $4, $4.5, $5, and $5.5 billion. I think it is absolutely essential to us and other agencies like ours in the country.

Mr. ROE. The gentleman from Massachusetts.

Mr. DONNELLY. Thank you, Mr. Chairman.

Mr. Button, earlier this week the mayor of Fall River testified to the committee objecting to EPA regulations that a specific fee be imposed on the users in their city before they would be eligible for EPA grants.

He believed that their existing system of setting aside x amount of dollars out of their broad property tax base was a better way to go. We used to do that in the city of Boston until I think 1977 when we established the sewer and water commission.

What is your opinion of having the specific set-aside user fee vis-a-vis allowing exceptions for municipalilties to fund their sewage systems out of a property tax base without mandating it be set aside?

Mr. BUTTON. Our experience, sir, has been that with the dedicated revenue stream we do have money available on a regular basis to do the work necessary to be done. The tide gate program is a good example.

In Massachusetts we have something called proposition 2½ which limits the amount of money which can be raised from local property taxes. It puts a restraint on municipal agencies to fund all the services which people expect of them. Sewer systems, unless there is a problem, and water systems, are not particularly visible and not particularly high priority items in competition with educational services, social services, police and fire protection.

Based upon what the priorities were in the city prior to the creation of Water and Sewer Comissions and what we are now able to do, I see a dedicated user system, which charges fees for water service on a metered basis and sewer service in conjunction with those, as being almost indispensible to carry out the work.

Mr. ROE. Would the gentleman hold at that point?

We will recess now for 10 minutes and go vote.

Mr. DONNELLY. Thank you, Mr. Chairman.

Mr. ROE. You don't mind, Mr. Button?

Mr. BUTTON. No, sir.

Mr. ROE. Thank you.

We will take 10 minutes and come right back.

[Recess.]

Mr. ROE. The subcommittee will resume its hearing.

When we broke up to go vote for that last amendment, the distinguished gentleman from Massachusetts was in a series of exchange of views with our witness. So if the gentleman would continue.

Mr. DONNELLY. Thank you, Mr. Chairman. My apologies for being late. I hope the city of Boston doesn't get stricken out of the bill now.

Mr. ROE. No, we discussed that before you got back.

Mr. DONNELLY. Continuing the questioning regarding the user fee, dedicated funds, so-called, do you have any idea how much we spent on sewer and water priority, the imposition of the user fee and establishment of the sewer and water commission versus what we expend today?

Mr. BUTTON. I do not have exact numbers available.

Last year, for example, our budget was $59 million. The user fee for sewer service prior to the creation of the Boston Water and Sewer Commission was a dollar a thousand cubic feet. Our fee now is over $5.40. We have collected and spent considerable amounts of money on the sewer system in the last few years.

The water system, the rates are about the same as they had been for water. We like to think that as the result of efficiency of oper-

ation, we were able to keep the water rate approximately the same. It—the water rate—has still allowed us to put more capital money into the ground in the past few years.

Mr. DONNELLY. Because of the age of Boston's system, are needs due to deterioration of old pipes or because of lack of capacity due to size?

Mr. BUTTON. There are a couple factors. A good deal of the system is 100 years old. As a consequence, it has suffered from aging as does any capital structure. But in addition to that, the demands put on the system have changed in that period of time. The population has grown considerably. Commercial-industrial applications have developed in the city which put a large demand on the systems.

Mr. DONNELLY. Where are we in terms of limiting and restraining the growth of pollution in Boston Harbor through sewer discharge and leakage.

Mr. BUTTON. Well, this summer and spring have seen a number of suits brought against the regulatory agencies in the State, the regional sewer authority and against us, alleging that because of overtaxed sewage treatment plants and sewer systems that there was a situation created in the harbor that required some very drastic actions with the threat of injunctions against building, a moratorium, and injunctions against connections of existing properties to the sewer system.

The State agencies and we and the courts are trying to work that out right now and there have not been those kinds of injunctions brought, but they are looming. They are there. The water and sewer commission, has begun construction on major interceptors to relieve the condition that existed in the old pipes.

We require that in any new building development the developers put in a holding tank for the sewage so they can discharge into the tank continuously during the day and pump out of the holding tank at off-peak hours so as not to aggravate the overloaded conditions.

We saw this as a reasonable compromise between allowing a discharge into the pipes which we know would overflow in certain periods of the day versus the other extreme.

Mr. DONNELLY. How much money did you receive from the Federal Government last year?

Mr. BUTTON. We have three construction jobs right now under way. One job was 2.5 million, another job was 6 million, another job about to go to construction now is an $18 million job. We have been given grants for 75 percent of that cost from EPA. The money is not all spent because of those jobs, one is completed, another one has a couple months to go, and the other one just now is getting rolling.

Mr. DONNELLY. How many do you have on the drawing boards, how many projects?

Mr. BUTTON. We had three projects fairly high on the State EPA priority list. The plans are done for them.

We have another project we are working on. We anticipate construction beginning next year. We have that work in the south end under design now. It is not long-range planning, because what we

have are plans that are there, ready to roll with construction. We have jobs under construction now.

We recognized the need and I believe the State and the local EPA does because our projects have been quite high in priority. Without augmentation of our ability to fund, they will not be completed, I do not believe. It will be extremely difficult for us to do that.

Mr. DONNELLY. Let me say in conclusion, I appreciate the fact that you came down here to testify. We look forward to working with you and other people in the Commonwealth to come up with legislation that will be fiscally responsible but also will deal with a national need and a national agenda need to improve the water quality and aquatic environment on the east coast, west coast, and throughout America.

Thank you.

Mr. ROE. I thank the gentleman.

Let me ask you, you spoke about obviously the necessary funding to be able to complete your work, among other issues. What is your backlog in dollars to really put that system on a fully tight operating track?

Mr. BUTTON. We have to define projects right now in the order of $60 or $70 million.

We also have that facilities plan under way which we expect will find and develop more projects.

Mr. ROE. Does a $60 to $70 million amount include complete replacement of your combined sewer system?

Mr. BUTTON. No.

Mr. ROE. What part of your system is in the combined sewer aspect?

Mr. BUTTON. Geographically, it represents about 25 percent of the city, in terms of area of the city.

It is those areas which were developed before 1910 basically.

From 1910 on, separate sewer systems were built.

Mr. ROE. What would it cost to correct the combined sewer system?

Mr. BUTTON. In conjunction with the regional authority, which has undertaken studies of combined sewer overflow control in areas which are tributary to the treatment plants.

It is in the order of hundreds of millions of dollars. The program itself was site specific and detailed. In some areas it recommended new pipes and separation of the pipes. In other areas it was a system of insystem storage. In other areas it was combined sewer overflow treatment and discharge to receiving waters, that was quite specific.

Mr. ROE. In that study did they generate any information in the quantitative amount of material that runs out of the combined sewer as it relates to pollution characteristics in the Boston Harbor?

You discharge into Boston Harbor, don't you?

Mr. BUTTON. To the harbor and there are two rivers that come into the harbor.

Mr. ROE. It all comes into the harbor.

Mr. BUTTON. Yes.

20-955 O—84——58

Mr. ROE. We fought that battle going back to 1970 and it is driving us bananas because we cannot seem to get any administration, doesn't matter which one, including EPA, to recognize if they are really going to do a job on pollution control they have to address the attention of the combined sewers; is that a correct statement?

Mr. BUTTON. Yes, sir, absolutely.

Mr. ROE. OK.

So to go through the drill of having you put in massive primary and secondary plants and every time you get a major rain we scour the sewers out and put it in the bay anyway. I wonder if an analysis has been made of that?

Mr. BUTTON. There has been in the study commissioned by the Metropolitan District Commission which is the regional sewer authority. It is comprised of 43 member towns; we are one of them.

We contribute and we pay for about a third of the sewage which comes from all those 43 towns. Their analysis took place over a period of approximately 3 years and they estimated that about 50 percent of BOD and suspended solids that came into the harbor in a year, came from what was left in the treatment plants discharge. The rest was combined sewer overflows.

Mr. ROE. From your technical view, and you are technically trained, that is a finite situation. You treated everything you could with primary and secondary treatment, and if you did that you would have a potential of close to 50 percent BOD demand because of the fact of combined sewer runoff, is that correct?

Mr. BUTTON. That is correct.

Mr. ROE. On the $60 to $70 million figure, how long a period—what are you receiving now in the city of Boston? From your priorities, how much do you get?

Mr. BUTTON. We have been fortunate in the last few years. Earlier this year the State came out with the priority list, there were hearings at the end of August and they are in the process of developing final lists that will be available on October 1. We had three projects in the top 10 for a total of $19 million out of the $65 million which came into Massachusetts, that is available for construction grants in Massachusetts.

Mr. ROE. What you are saying is if you could get that level for 4 or 5 years you would be able to clean up part of the backlog?

Mr. BUTTON. Absolutely.

Mr. ROE. At that level of funding?

Mr. BUTTON. At or above that level. We have more projects than there is money available for now, but there are other communities competing for the same funds, including the regionals.

Mr. ROE. The reason I ask, in our discussion with the folks from the city of New York they had a deficit of about $16 billion as I recall without the combined sewer situation. They figure it would take to the year 2020 before they could complete it if they got the level of funding now, giving rise to the matter that if we are going to get at this problem we have to put more funds in it. That is basically the issue; do you agree with that?

Mr. BUTTON. Yes, sir.

Mr. ROE. Should there be a way for older cities, that do have the problem of combined sewers, that there ought to be more flexibility for those to be cleaned up?

Mr. BUTTON. Well, I think so. As a matter of fact a few years ago the Commonwealth put together some information and came to the Congress to present that information. In addition to construction grants which were building the sewage treatment plants in the various communities; there was the defined need of the Boston Harbor area because of 350 years that people have been living there and contributing something to the harbor area. It is not something we just had come up overnight. It is a significant problem.

It is something we are trying to identify and point out in and of itself. The studies have indicated that approximately $2 billion in the greater Boston area for sewer work, treatment plant work, discharges, deep ocean discharges, sludge handling, and work on the combined sewer system is needed. The amount I spoke of, $60 to $70 million, is for the confined number of projects we could do in the next 6 years. Beyond that point we expect more work to be identified in the facilities plan and we do work that is not part of the construction grant program on local sewers and smaller things every year. There is millions of dollars of work that we do.

So it will never go away. It is something that I believe will continue. We are going to have to work on it for years to come. The original act was to attack a defined problem that was perceived around the country. It has been 10 years and I don't think the problem has gone away.

It is necessary now to focus on that for a few years, 5 or 10 years down the road, to get the problems under control where agencies can get a handle on them and manage them.

Mr. ROE. One thing, just for the record, one thing that is clear and concise is that unless you have adequate funding to be able to clean up the combined sewer problem. You are only dealing with 50 percent of the pollution control as far as Boston Harbor is concerned, or thereabouts?

Mr. BUTTON. That is correct.

Mr. ROE. Thank you.

I just wanted that for the record.

The gentlelady from Illinois.

Mrs. LYNN MARTIN. Thank you, Mr. Chairman.

You are aware that this chairman knows more about this subject than really anyone in the Congress. So that his concern is good news for Boston. You are also fortunate that Brian is here because I think he does a superb job. We are on opposite sides and I still tell you that.

Mr. ROE. I have that all carefully recorded, young lady.

Thank you for your generous comments. I want to thank you, Mr. Button, because you brought a clear picture to us and I thank our colleague Brian for inviting you here.

We would like to get more writings from you with a projection of what your needs are so we can factor that into our request for additional funding.

Thank you again.

Mr. BUTTON. Thank you very much.

Mr. ROE. Our next witness this afternoon represents the Illinois Department of Environmental Protection, Hon. Roger Kanerva, manager of environmental programs.

For the distinct honor of welcoming you to this distinguished committee, I would like to defer to the Congresslady from Illinois, Mrs. Lynn Martin.

Mrs. MARTIN. Thank you, Mr. Chairman.

For you, graciousness is usual but it is still appreciated from the Illinois Representative.

First a compliment to you, Roger. Staff tells me that the testimony and the evidence that you have given to the committee is not only the most extensive but the best laidout in terms of making the problems clear to us and you and whoever was responsible for that should be complimented.

I wonder if we can concentrate on a particular part of your testimony and that is that of pretreatment. I think we all accept that what we are interested in is what finally goes back to our streams and our rivers. How that is taken care of, though, is part of the Federal law.

Could you discuss briefly the pretreatment situation in Illinois and local programs with pretreatment and what the effects would be of changes for them.

Mr. ROE. Mr. Kanerva, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY

before

Subcommittee on Water Resources

Committee on Public Works and Transportation

U.S. House of Representatives

September 22, 1983

by

Roger A. Kanerva, Manager

Environmental Programs

Illinois Environmental Protection Agency

2200 Churchill Road

Springfield, Illinois

217/785-5735

I thank the Subcommittee for scheduling this hearing to receive testimony for the purpose of considering the reauthorization of the Clean Water Act. My testimony is presented on behalf of the Illinois Environmental Protection Agency (Illinois EPA) and the State of Illinois. The Illinois EPA is responsible for administering the State's pollution control laws and regulations, and for working cooperatively with USEPA in implementing similar federal programs. My current

assignment with the Illinois EPA is to manage all media environmental programs, such as water, air and land pollution control and public water supplies plus several support functions such as laboratories and data processing.

Prior to this current assignment, I was the Manager of the Division of Water Pollution Control (DWPC) for the Illinois EPA from June, 1978 to May, 1981. The DWPC is responsible for all aspects of the State water pollution control program including water quality management planning, ambient monitoring and standards, construction grants, and permitting and enforcement. Prior to that time, I worked for nearly nine years with the Water Resources Administration of the Maryland Department of Natural Resources in various program management and technical capacities. My professional education is in watershed management with B.S. and M.S. degrees from the University of Arizona.

I view this round of reauthorization of the Clean Water Act to be as important as the original 1972 national initiative. The program is truly at a major crossroads; that is, both the institutional and technical framework of the program need careful examination. Let me explain.

In 1972, the Act set out to overcome the principal weaknesses in past efforts to control water pollution. Technology-based effluent requirements were emphasized over water quality-based requirements as a means of expediting both municipal and industrial cleanup. Strong centralized program management was emphasized over decentralized state program management as a means of establishing more uniformity and consistency in implementation and enforcement of the cleanup effort. These new strategies were effective and I, for one, can attest to the positive results that were achieved.

What must not be overlooked now, however, are the significant changes that the past decade has brought which, in turn, call for rethinking the strategy for the 80's. I would like to mention several key considerations in this regard:

- We now have an operating baseline of protection in place all over the country to ensure against gross insults to the waters of the nation. I would add that many of the discharge permits issued for industries were based upon "best professional judgement" evaluations rather than national categorical standards.

- State programs, in general, have been enhanced and greatly matured due to interaction with the national program.

- Enhanced accountability measures, such as citizen suits and public participation, stand watch over much of the operation of the program.

- Fiscal resources have largely become constrained to a program maintenance level.

- The demands have been steadily growing for water quality related justification for program decisions on treatment requirements, use of federal construction grants funds, and targeting of compliance activities.

Against this background, I would like to state the central theme for this testimony. Adequate concern for "GOOD GOVERNMENT" has gotten lost in the fracas these past ten years. As a state program manager, I can assertively report to you today that along with the good things I mentioned at the outset I also do a lot of dumb things as part of my role in the clean water program. I say this in partial reply to certain parties that choose to conveniently side-step this issue with simplistic political slogans about "clean water" versus "dirty water people". The rest of this testimony will address a number of major issues pending during this reauthorization with a view towards demonstrating that "good government" is not synonymous with "dirty water".

Life After BAT

There is no question that adequate toxics control is a problem which deserves further attention under the clean water program. In Illinois, we remain committed to the national policy expressed in Section 101(a)(3) of the Act which prohibits "...the discharge of toxic pollutants in toxic amounts..." On June 24, 1980, I testified before the Subcommittee on Oversight and Review of the House Public Works and Transportation Committee regarding control of toxic substances. At that time, I emphasized the programmatic and technical problems associated with singular pursuit of the "priority pollutant" strategy codified in the NRDC Consent Decree in 1976 and the Clean Water Act in 1977. I also stated that more emphasis should be placed upon biological toxicity assessment techniques which can serve as cost effective tools for addressing effluents containing complex mixtures of chemical substances.

I remain equally convinced today about the considerable shortcomings of a strategy relying entirely upon a list of chemical substances and related limits. In addition to the work I reported on in 1980, information we have obtained regarding NRDC-related requirements for submitting chemical data on "priority pollutants" reinforces this position. In Illinois, we have received and reviewed over 100 "second round" NPDES permit applications with results from some 358 samples. Fewer than 3 percent of the 34,600 plus analyses revealed organic compounds at levels greater than the analytical detection limits. An initial evaluation of this 3 percent group yielded some concern for less than 10 percent of the compounds detected. More importantly, without

some site-specific toxicity testing we have no way of responsibly assuring that chemicals not on the NRDC list are innocuous or that the overall "chemical soup" is not an environmental problem.

On the more positive side, I can report today that the Illinois EPA, in cooperation with Region V, USEPA, has developed and begun to implement a formal strategy (see Appendix A) for control of toxic pollutants from industrial discharges via the NPDES permit process. This strategy uses a balanced combination of chemical and biological techniques to evaluate toxicity of effluents and develop appropriate control programs. Fortunately, our water quality standards already cover the heavy metals, cyanide, phenols and a number of pesticides which aids in the review process. However, we have about reached the practical limit of what makes sense to regulate directly by numerical criteria in standards. We may add a few more chemical substances to our standards but cannot envision ever being able to expand the system to cover hundreds of individual chemical substances. The due process burden would be simply overwhelming. Thus, our strategy targets state resources on a facility-specific basis to address significant potential toxicity problems.

How does all this talk about toxics relate to the issue of "good government"? First of all, we are responsible for using our limited public funds as effectively as possible. In Illinois, we cannot, in good conscience, chase around after chemicals on an arbitrary national listing when we know that most toxicity problems tend to be facility and even individual discharge specific. Secondly, we feel confident that BPT/BAT

controls have or soon will resolve many concerns. Hence the need for a very selective and targeted follow-up effort to address the remaining questions or problems. And finally, we run the substantial risk of providing less overall net protection by scattering our program efforts over a fairly wide but likely irrelevant range of chemicals of possible concern.

Recommendation -- Congress should ensure that USEPA and the States have sufficient direction and flexibility to pursue a balanced attack on the toxics problem utilizing an appropriate mixture of chemical-specific techniques and toxicity assessment to address both human health and aquatic life concerns.

The Pretreatment Opportunity

In my view the debate over implementation of the federal pretreatment program has gotten way off the mark. In Illinois, we do not question the fact that some POTWs need an effective pretreatment program. In my 1980 testimony, I reported that most of our significant POTWs had adequate locally-based pretreatment programs in operation which were monitored via NPDES controls. At that time and until very recently, the federal pretreatment program was essentially non-operative due to the lack of categorical standards and complex difficulties with the program regulations (removal credits, combined waste stream formula, reporting and oversight requirements). I would also note that these regulations are a classic case of bureaucratic overkill from many perspectives.

The real issue with pretreatment in my book is "good government". If some locally-based programs are already achieving the intended results (protecting the treatment facility, receiving waters and sludge management), then why in these trying economic times should we abandon successful local programs for a more expensive, less workable federal program? In effect, those good faith POTWs that moved ahead on pretreatment years ago may now be penalized for their progressive action. On the other hand, the bad faith POTWs that did not spend the funds to develop and run a program to control their industries seem so much the better off for their delay.

Let me provde you with some specifics for Illinois (See Appendix B for details). We have about 754 POTWs with about 3,000 industrial facilities thought to be subject to the federal pretreatment regulations. For comparisons sake, that number of indirect dischargers is just about 20 percent greater than the entire population of direct dischargers currently regulated under the NPDES program.

Of the 754 POTWs, 84 POTWs receive effluent from about 73 percent of the indirect industrial dischargers, and, thus, have been the prime targets for our recent efforts on pretreatment. Based upon a phased screening approach, we have received program development data from most of these 84 POTWs. The following table presents an analysis of that information:

	Status of Programs	5 MGD and Over	Under 5 MGD	Total
1.	Significant POTWs for pretreatment.	41	43	84
2.	Preliminary State estimate of POTWs subject to federal program.	30	20	50

3.	Program submittal reviews completed by State.	22	20	42
4.	Number of POTWs reviewed subject to the federal program.	21	7	28
5.	Number of POTWs in 4. above that have existing local program.	19	5	24
6.	Number of POTWs in 5. above that have a good local program.	13	5	18

Thus, we have a situation in Illinois where about 75 percent of the federally related program submittals reviewed to date involve POTWs that have already been operating a good local pretreatment program for some time. Why then, I ask again, should the State of Illinois and these local jurisdictions be subject to the extra hassle and expense of converting to the federally designed, pretreatment program? (See Appendix B for more details.) We are especially frustrated by what we believe represents a clear contravention of the legislative history of the 1972 and 1977 Acts regarding recognition of the substantial investment in combined waste treatment in public systems. Whether it's popular to say or not, there is just no getting around the basic fact that the NPDES program for direct dischargers is simply not fully analagous to the POTW/indirect industrial discharger scenario.

Within the past few months, even a potentially more serious concern has developed with the federal pretreatment program. At the request of Senate Environment Committee staff, USEPA undertook a special project in May, 1983 to evaluate the local pretreatment programs of three major POTWs. One of the three was the Metropolitan Sanitary District of Greater Chicago. The main purpose was to conduct a preliminary

assessment of the degree to which these locally-based programs were "equivalent" to the federal program. While a short-fused study of this nature is fraught with difficulties, we came upon an alarming finding from this study. Based upon our review of the available information (see Appendix C for details), we concluded that implementation of the federal categorical standards and program regulations in lieu of MSDGC's current program could conceivably result in a net reduction in control requirements for industrial facilities at a substantially greater program cost for operations! This finding raises an entirely new spectre about imposing another "uniform" national program. It certainly makes good sense to impose the federal program on POTWs that have not already successfully gone ahead on their own. But it would not serve the environmental cause well to impose such a program on some POTWs where a backsliding effect could take place.

In response to the critics of providing a place in the clean water program for alternative local pretreatment systems, I would like to address several key concerns. First of all, the availability of alternative local programs could become a convenient excuse for further delay on the part of recalcitrant POTWs. This potential pitfall could be remedied by restricting the use of local programs to those already in existence and not providing an additional year or two for developing an alternative local program. Secondly, such alternative local programs should also be subject to re-evaluation after all the applicable federal categorical standards are promulgated to ensure that the intent of "equivalency" has been satisfied. Finally, care should be taken to

ensure that "POTW shopping" does not take place on the part of less progressive industries pushing for more lenient local standards. This potential problem could be addressed by requiring all new industrial sources tributary to POTWs to meet federal pretreatment standards for new sources. In effect, such a requirement would provide for a gradual, phased conversion from current locally-based limits to federal limitations where appropriate to do so.

Returning to my "good government" theme, the Illinois EPA wants to maximize the environmental protection which can reasonably be achieved given the expected program resource constraints. Bluntly put, the water pollution control program in Illinois will be set back if the federal pretreatment program is pushed forward in its current form. We currently commit about 57 work years at a direct cost of almost $1.5 million per year for operation of the NPDES program (including pretreatment activities). We estimate that the level of State effort and resource requirements could nearly double if it becomes necessary to run the current federal program to the letter of the regulations. Obviously, these kind of additional resources (state or federal funds) are just not in the cards.
